ENCYCLOPÆDIA BRITANNICA;
OR, A
DICTIONARY
OF
ARTS, SCIENCES,
AND
MISCELLANEOUS LITERATURE;

Constructed on a PLAN,

BY WHICH

THE DIFFERENT SCIENCES AND ARTS

Are digested into the FORM of Distinct

TREATISES OR SYSTEMS,

COMPREHENDING

The HISTORY, THEORY, and PRACTICE, of each,
according to the Latest Discoveries and Improvements;

AND FULL EXPLANATIONS GIVEN OF THE

VARIOUS DETACHED PARTS OF KNOWLEDGE,

WHETHER RELATING TO

NATURAL and ARTIFICIAL Objects, or to Matters ECCLESIASTICAL,
CIVIL, MILITARY, COMMERCIAL, &c.

Including ELUCIDATIONS of the most important Topics relative to RELIGION, MORALS,
MANNERS, and the OECONOMY of LIFE:

TOGETHER WITH

A DESCRIPTION of all the Countries, Cities, principal Mountains, Seas, Rivers, &c.
throughout the WORLD;

A General HISTORY, *Ancient and Modern*, of the different Empires, Kingdoms, and States;

AND

An Account of the LIVES of the most Eminent Persons in every Nation,
from the earliest ages down to the present times.

Compiled from the writings of the best Authors, in several languages; the most approved Dictionaries, as well of general science as of its particular branches; the Transactions, Journals, and Memoirs, of Learned Societies, both at home and abroad; the MS. Lectures of Eminent Professors on different sciences; and a variety of Original Materials, furnished by an Extensive Correspondence.

THE THIRD EDITION, IN EIGHTEEN VOLUMES, GREATLY IMPROVED.

ILLUSTRATED WITH FIVE HUNDRED AND FORTY-TWO COPPERPLATES.

VOL. IV.

INDOCTI DISCANT, ET AMENŒT MINIMISSE PERITI.

EDINBURGH.

PRINTED FOR A. BELL AND C. MACFARQUHAR.

MDCCXCVII.

Entered in Stationers Hall in Terms of the Act of Parliament.

C.
Caaba.

C THE third letter, and second consonant, of the *a, b, c* alphabet, is pronounced like *k* before the vowels *a, o, and u*; and like *s* before *e, i, and y*. *C* is formed, according to Scaliger, from the *κ* of the Greeks, by retrenching the stem or upright line; though others derive it from the *צ* of the Hebrews, which has in effect the same form; allowing only for this, that the Hebrews, reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However, the *C* not being the same as to sound with the Hebrew *caph*, and it being certain the Romans did not borrow their letters immediately from the Hebrews or other orientals, but from the Greeks, the derivation from the Greek *κ* is the more probable. Add, that F. Montfaucon, in his *Palæographia*, gives us some forms of the Greek *κ*, which come very near that of our *C*; thus, for instance, *ϰ*: and Suidas calls the *C* the Roman kappa. The second sound of *C* resembles that of the Greek *ζ*; and many instances occur of ancient inscriptions, in which *ζ* has the same form with our *C*. All grammarians agree, that the Romans pronounced their *Q* like our *C*, and their *C* like our *K*. F. Mabillon adds, that Charles the Great was the first who wrote his name with a *C*; whereas all his predecessors of the same name wrote it with a *K*: and the same difference is observed in their coins.

As an abbreviature, *C* stands for Caius, Carolus, Cæsar, *condemno*, &c. and *CC* for *consulibus*.

As a numeral, *C* signifies 100, *CC* 200, &c.

C, in music, placed after the *cliff*, intimates that the music is in common time, which is either quick or slow, as it is joined with *allegro* or *adagio*: if alone, it is usually *adagio*. If the *C* be crossed or turned, the first requires the air to be played quick, and the last very quick.

CAABA, or CAABAH, properly signifies a square stone building; but is particularly applied by the Mahometans to the temple of Mecca, built, as they pretend, by Abraham and Ishmael his son.

Before the time of Mahomet, this temple was a place of worship for the idolatrous Arabs, and is said to have contained no less than 360 different images, equalling in number the days of the Arabian year. They were all destroyed by Mahomet, who sanctified the Caaba, and appointed it to be the chief place of worship for all true believers. The temple is in length from north to south about 24 cubits; its breadth from east to west is 23; and its height 27. The door, which is on the east side, stands about four cubits from the ground; the floor being level with the bottom of

VOL. IV. Part. I.

the door. In the corner next this door is the *black stone*, so much celebrated among the Mahometans. On the north side of the caaba, within a semicircular inclosure 50 cubits long, lies the *white stone*, said to be the sepulchre of Ishmael, which receives the rain-water from the caaba by a spout formerly of wood, but now of gold. The black stone, according to the Mahometans, was brought down from heaven by Gabriel at the creation of the world; and originally of a white colour; but contracted the blackness that now appears on it, from the guilt of those sins committed by the sons of men. It is set in silver, and fixed in the south-east corner of the caaba, looking towards Basra, about seven spans from the ground. This stone, upon which there is the figure of a human head, is held in the highest estimation among the Arabs; all the pilgrims kissing it with great devotion, and some even calling it the *right hand of God*. Its blackness, which is only superficial, is probably owing to the kisses and touches of so many people. After the Karmatians had taken Mecca, they carried away this precious stone, and could by no means be prevailed upon to restore it; but finding at last that they were unable to prevent the concourse of pilgrims to Mecca, they sent it back of their own accord, after having kept it 22 years.

The double roof of the caaba is supported within by three octagonal pillars of aloes-wood; between which, on a bar of iron, hang some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and was formerly sent by the khalifs, afterwards by the sultans of Egypt, and is now provided by the Turkish emperors. The caaba, at some distance, is almost surrounded by a circular inclosure of pillars, joined towards the bottom by a low ballustrade, and towards the top by bars of silver. Just without this inner inclosure, on the south, north, and west sides of the caaba, are three buildings, which are the oratories or places where three of the orthodox sects assemble to perform their devotions. Towards the south-east stands an edifice which covers the well Zemzen, the treasury, and the cupola of Al Abbas. Formerly there was another cupola, that went under the name of the *hemicycle*, or *cupola of Judea*: but whether or not any remains of that are now to be seen is unknown; nor is it easy to obtain information in this respect, all Christians being denied access to this holy place. At a small distance from the caaba, on the east side, is the *station* or *place* of Abraham; where is another stone much respected by the Mahometans; and where they pretend

Caaba.

A

to

Caaba
||
Cab.

to show the footsteps of the patriarch, telling us he stood on it when he built the caaba. Here the fourth sect of Arabs, viz. that of Al Shafei, assemble for religious purposes.

The square colonnade, or great piazza, that at a considerable distance incloses these buildings, consists, according to Al Jannabi, of 448 pillars, and has no less than 38 gates. Mr Sale compares this piazza to that of the royal exchange at London, but allows it to be much larger. It is covered with small domes or cupolas, from the four corners of which rise as many minarets or steeples, with double galleries, and adorned with gilded spires and crescents after the Turkish manner, as are also the cupolas which cover the piazza and other buildings. Between the columns of both inclosures hang a great number of lamps, which are constantly lighted at night. The first foundations of this second inclosure were laid by Omar the second khalif, who built no more than a low wall, to prevent the court of the caaba from being incroached upon by private buildings; but by the liberality of succeeding princes, the whole has been raised to that state of magnificence in which it appears at present.

This temple enjoys the privilege of an asylum for all sorts of criminals; but it is most remarkable for the pilgrimages made to it by the devout musselmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious, in the sight of God, as the most careful discharge of one's duty, for the space of a whole year, in any other temple.

CAAMINI, in botany, a name given by the Spaniards and others to the finest sort of Paraguayan tea. It is the leaf of a shrub which grows on the mountains of Maracaya, and is used in Chili and Peru as the tea is with us. The mountains where this shrub grows naturally are far from the inhabited parts of Paraguay; but the people of the place know so well the value and use of it, that they constantly furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together; leaving their country in the mean time exposed to the insults of their enemies, and many of themselves perishing by fatigue. To avoid these inconveniences, they have of late planted these trees about their habitations; but the leaves of these cultivated ones have not the fine flavour of those that grow wild. The king of Spain has permitted the Indians of Paraguay to bring to the town of Saintfooy 12,000 arobes of the leaves of this tree every year, but they are not able to procure so much of the wild leaves annually: about half the quantity is the utmost they bring of this: the other half is made up of the leaves of the trees in their own plantations; and this sells at a lower price, and is called *pabos*. The arobe is about 25 pound weight; the general price is four piaftres; and the money is always divided equally among the people of the colony.

CAANA, or KAANA, a town in Upper Egypt, seated on the eastern banks of the river Nile, from whence they carry corn and pulse for the supply of Mecca in Arabia. E. Long. 32. 23. N. Lat. 24. 30. Here are several monuments of antiquity yet remaining, adorned with hieroglyphics.

CAB, an Hebrew dry measure, being the sixth part

of a seah or satum, and the 18th part of an ephah. A cab contained $2\frac{1}{2}$ pints of our corn-measure: a quarter cab was the measure of dove's dung, or more properly a sort of chick-pease called by this name, which was sold at Samaria, during the siege of that city, for five shekels.

CABAL, an apt name currently given to the infamous ministry of Charles II. composed of five persons, Clifford, Ashley, Buckingham, Arlington, and Lauderdale; the first letters of whose names, in this order, furnished the appellation by which they were distinguished.

CABALIST, in French commerce, a factor or person who is concerned in managing the trade of another.

CABALLARIA, in middle-age writers, lands held by the tenure of furnishing a horseman, with suitable equipage, in time of war, or when the lord had occasion for him.

CABALLEROS, or CAVALLEROS, are Spanish wools, of which there is a pretty considerable trade at Bayonne in France.

CABALLINE, denotes something belonging to horses: thus caballine aloes is so called, from its being chiefly used for purging horses; and common brimstone is called *sulphur caballinum* for a like reason.

CABALLINUM (anc. geog.), a town of the *Ædui* in Gallia Celtica; now *Challon sur Saone*, which see.

CABALLINUS (anc. geog.), a very clear fountain of mount Helicon in *Bœotia*; called *Hippocrene* by the Greeks, because opened by Pegasus on striking the rock with his hoof, and hence called *Pegasus*.

CABALLIO, or CABELLIO (anc. geog.), a town of the *Cavares* in Gallia Narbonensis, situated on the *Druentia*. One of the Latin colonies, in the *Notitiæ* called *Civitas Cabellicorum*. Now *Cavaillon* in Provence.

CABBAGE, in botany. See BRASSICA; and AGRICULTURE, n° 40, and 169. In the Georgical essays, we find this plant greatly recommended as an excellent food for cattle, producing much dung, and being an excellent substitute for hay. The author prefers the Scotch kind, as being most durable, and preferable on all other accounts. He also recommends autumn-sowed plants in preference to those sowed in the spring; the former producing a much more weighty crop than the latter. The expence of raising an acre of good cabbages he values at 14*l.* 15*s.* and its produce at 34*l.*

CABBAGE-Tree, or True CABBAGE-PALM. See ARECA.

CABBAGE-BARK Tree. See GEOFFRÆA.

CABBALA, according to the Hebrew style, has a very distinct signification from that wherein we understand it in our language. The Hebrew cabbala signifies tradition; and the Rabbins, who are called *cabbalists*, study principally the combination of particular words, letters, and numbers, and by this means pretend to discover what is to come, and to see clearly into the sense of many difficult passages of scripture. There are no sure principles of this knowledge, but it depends upon some particular traditions of the ancients; for which reason it is termed *cabbala*.

The cabbalists have abundance of names which they call *sacred*; these they make use of in invoking of spirits, and imagine they receive great light from them. They

Cabal
||
Cabbala

Cabbala
||
Cabenda.

They tell us, that the secrets of the cabbala were discovered to Moses on mount Sinai; and that these have been delivered to them down from father to son, without interruption, and without any use of letters; for to write them down, is what they are by no means permitted to do. This is likewise termed the *oral law*, because it passed from father to son, in order to distinguish it from the written laws.

There is another cabbala, called *artificial*, which consists in searching for abstruse and mysterious significations of a word in Scripture, from whence they borrow certain explanations, by combining the letters which compose it: this cabbala is divided into three kinds, the *gematrie*, the *notaricon*, and the *temura* or *themurah*. The first whereof consists in taking the letters of a Hebrew word for ciphers or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The second sort of cabbala, called *notaricon*, consists in taking every particular letter of a word for an entire diction; and the third, called *themura*, i. e. change, consists in making different transpositions or changes of letters, placing one for the other, or one before the other.

Among the Christians, likewise, a certain sort of magic is, by mistake, called *cabbala*; which consists in using improperly certain passages of Scripture for magic operations, or in forming magic characters or figures with stars and talismans.

Some visionaries among the Jews believe, that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

CABBALISTS, the Jewish doctors who profess the study of the cabbala.

In the opinion of these men, there is not a word, letter, or accent in the law, without some mystery in it. The Jews are divided into two general sects; the *karaites*, who refuse to receive either tradition or the *talmud*, or any thing but the pure text of scripture; and the *rabbinists*, or *talmudists*, who, besides this, receive the traditions of the ancients, and follow the *talmud*.

The latter are again divided into two other sects; pure *rabbinists*, who explain the scripture in its natural sense, by grammar, history, and tradition; and *cabbalists*, who, to discover hidden mystical senses, which they suppose God to have couched therein, make use of the cabbala, and the mystical methods above mentioned.

CABECA, or CABESSE, a name given to the finest silks in the East Indies, as those from 15 to 20 *per cent.* inferior to them are called *barina*. The Indian workmen endeavour to pass them off one with the other; for which reason, the more experienced European merchants take care to open the bales, and to examine all the skaines one after another. The Dutch distinguish two sorts of cabecas; namely, the *moor cabeca*, and the common *cabeca*. The former is sold at Amsterdam for about 21½ *schellinghen* Flemish, and the other for about 18½.

CABECA de Vide, a small sea-port town of Alentejo in Portugal, with good walls, and a strong castle. W. Long. 6. 43. N. Lat. 39. 0.

CABENDA, a sea-port of Congo in Africa, situated in E. Long. 12. 2. S. Lat. 4. 5.

Cabes
||
Cabinet.

CABES, or GABES, a town of Africa, in the kingdom of Tunis, seated on a river near the gulf of the same name. E. Long. 10. 55. N. Lat. 33. 40.

CABEZZO, a province of the kingdom of Angola, in Africa; having Oacco on the north, Lubolo on the south, the Coanza on the north-east, and the Reinba on the south-west. It is populous, and well stored with cattle, &c. and hath a mine of iron on a mountain from thence called the *iron mountain*, which yields great quantities of that metal; and this the Portuguese have taught the natives to manufacture. This province is watered by a river called *Rio Longo*, and other small rivulets, lakes, &c. The trees here are vastly large; and they have one sort not unlike our apple-trees, the bark of which being slashed with a knife, yields an odoriferous resin of the colour and consistency of wax, and very medicinal in its nature, only a little too hot for Europeans, unless qualified by some cooling drug.

CABIDOS, or CAVIDOS, a long measure used at Goa, and other places of the East Indies belonging to the Portuguese, to measure stuffs, linens, &c. and equal to 4ths of the Paris ell.

CABIN, a room or apartment in a ship where any of the officers usually reside. There are many of these in a large ship; the principal of which is designed for the captain or commander. In ships of the line this chamber is furnished with an open gallery in the ship's stern, as also a little gallery on each quarter. The apartments where the inferior officers or common sailors sleep and mess are usually called *BIRTHS*; which see.

The bed-places built up for the sailors at the ship's side in merchantmen are also called *cabins*.

CABINDA, the chief port of the kingdom of Angoy in Loango in Africa. It is situated at the mouth of a river of the same name about five leagues north of Cape Palmerino, on the north side of the mouth of the river Zaire. The bay is very commodious for trade, wooding, and watering.

CABINET, the most retired place in the finest part of a building, set apart for writing, studying, or preserving any thing that is precious.

A complete apartment consists of a hall, anti-chamber, chamber, and cabinet, with a gallery on one side. Hence we say, a cabinet of paintings, curiosities, &c.

CABINET, also denotes a piece of joiner's workmanship, being a kind of press or chest, with several doors and drawers.

There are common cabinets of oak or of chesnut, varnished cabinets of China and Japan, cabinets of inlaid work, and some of ebony, or the like scarce and precious woods. Formerly the Dutch and German cabinets were much esteemed in France; but are now quite out of date, as well as the cabinets of ebony which came from Venice.

CABINET is also used in speaking of the more select and secret councils of a prince or administration. Thus we say, the secrets, the intrigues of the cabinet. To avoid the inconveniences of a numerous council, the policy of Italy and practice of France first introduced cabinet councils. King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of cabinet council, or *junto*, under the denomination of a council of state; composed of archbishop Laud, the earl of

Cabinet
||
Cable.

Strafford, and lord Collington, with the secretaries of state. Yet some pretend to find the substance of a cabinet council of much greater antiquity, and even allowed by parliament, who anciently settled a quorum of persons most confided in, without whose presence no arduous matter was to be determined; giving them power to act without consulting the rest of the council. As long since as the 28th of Henry III. a charter passed in affirmance of the ancient rights of the kingdom; which provided, that four great men, chosen by common consent, who were to be conservators of the kingdom, among other things, should see to the disposing of monies given by parliament, and appropriated to particular uses; and parliaments were to be summoned as they should advise. But even of these four, any two made a quorum; and generally the chief justice of England, and chancellor, were of the number of the conservators. Matth. Par. 28. Hen. III. In the first of Henry VI. the parliament provides, that the quorum for the privy council be six, or four at least; and that in all weighty considerations, the dukes of Bedford and Gloucester, the king's uncles, should be present; which seems to be erecting a cabinet by law.

CABIRI, a term in the theology of the ancient Pagans, signifying great and powerful gods; being a name given to the gods of Samothracia. They were also worshipped in other parts of Greece, as Lemnos and Thebes, where the cabiria were celebrated in honour of them; these gods are said to be, in number, four, viz. Axieros, Axioerca, Axioerfus, and Casmilus.

CABIRIA, festivals in honour of the Cabiri, celebrated in Thebes and Lemnos, but especially in Samothracia, an island consecrated to the Cabiri. All who were initiated into the mysteries of these gods, were thought to be secured thereby from storms at sea, and all other dangers. The ceremony of initiation was performed by placing the candidate, crowned with olive branches, and girded about the loins with a purple ribband, on a kind of throne, about which the priests, and persons before initiated, danced.

CABLE, a thick, large, strong rope, commonly of hemp, which serves to keep a ship at anchor.

There is no merchant-ship, however weak, but has at least three cables; namely, the chief cable, or cable of the sheet-anchor, a common cable, and a smaller one.

Cable is also said of ropes, which serve to raise heavy loads, by the help of cranes, pullies, and other engines. The name of *cable* is usually given to such as have, at least, three inches in circumference; those that are less are only called *ropes*, of different names according to their use.

Every cable, of whatsoever thickness it be, is composed of three strands; every strand of three ropes; and every rope of three twists: the twist is made of more or less threads, according as the cable is to be thicker or thinner.

In the manufacture of cables, after the ropes are made, they use sticks, which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable, to the end that they may all twist the better, and be more regularly wound together; and also, to prevent them from entwining or entangling, they hang, at the end of each strand and of each rope, a weight of lead or of stone.

The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus, a cable of three inches circumference, or one inch diameter, ought to consist of 48 ordinary threads, and to weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchantmen for their own account, or freight them for the account of others.

A table of the number of threads and weight of cables of different circumferences.

Circumf.	Threads.	Weight.
3 inches	48	192 pounds.

20	1943	7772

Sheet-Anchor CABLE, is the greatest cable belonging to a ship.

Stream CABLE, a hawser or rope, something smaller than the bowers, and used to moor the ship in a river, or haven, sheltered from the wind and sea, &c.

Serve or Plate the CABLE, is to bind it about with ropes, clouts, &c. to keep it from galling in the hawse.

To splice a CABLE, is to make two pieces fast together, by working the several threads of the rope the one into the other.

Pay more CABLE, is to let more out of the ship.

Pay cheap the Cable, is to to hand it out apace. **Veer more Cable**, is to let more out, &c.

CABLE's Length, a measure of 120 fathoms, or of the usual length of the cable.

CABLED, in heraldry, a term applied to a cross formed of the two ends of a ship's cable; sometimes also to a cross covered over with rounds of rope; more properly called a *cross corded*.

CABLED Flute, in architecture, such flutes as are filled up with pieces in the form of a cable.

CABO DE ISTRIA, the capital town of the province of Istria, in the territory of Venice; and the see of a bishop. It is seated on a small island in the gulf of Venice, and is joined to the main land by draw-bridges. E. Long. 14. 22. N. Lat. 45. 49.

CABOCHED, in heraldry, is when the heads of beasts are borne without any part of the neck, full-faced.

CABOLETTO, in commerce, a coin of the republic of Genoa, worth about 3d. of our money.

CABOT (Sebastian), the first discoverer of the continent of America, was the son of John Cabot a Venetian. He was born at Bristol in 1477; and was taught by his father arithmetic, geometry, and cosmography.

Cable
||
Cabot.

Cabot,
Cabra

graphy. Before he was 20 years of age he made several voyages. The first of any consequence seems to have been made with his father, who had a commission from Henry VII. for the discovery of a north-west passage to India. They sailed in the spring of 1497; and proceeding to the north-west they discovered land, which for that reason they called *Primavista*, or *Newfoundland*. Another smaller island they called *St John*, from its being discovered on the feast of St John Baptist; after which, they sailed along the coast of America as far as Cape Florida, and then returned to England with a good cargo, and three Indians aboard. Stowe and Speed ascribe these discoveries wholly to Sebastian, without mentioning his father. It is probable that Sebastian, after his father's death, made several voyages to these parts, as a map of his discoveries, drawn by himself, was hung up in the privy garden at Whitehall. However, history gives but little account of his life for near 20 years; when he went to Spain, where he was made pilot-major, and intrusted with reviewing all projects for discoveries, which were then very numerous. His great capacity and approved integrity induced many eminent merchants to treat with him about a voyage by the new found straits of Magellan to the Moluccas. He therefore sailed in 1525, first to the Canaries; then to the Cape Verd islands; thence to St Augustine and the island of Patos; when some of his people beginning to be mutinous, and refusing to pass through the straits, he laid aside the design of sailing to the Moluccas; left some of the principal mutineers upon a desert island; and, sailing up the rivers of Plate and Paraguay, discovered, and built forts in, a large tract of fine country, that produced gold, silver, and other rich commodities. He thence dispatched messengers to Spain for a supply of provisions, ammunition, goods for trade, and a recruit of men: but his request not being readily complied with, after staying five years in America, he returned home; where he met with a cold reception, the merchants being displeased at his not having pursued his voyage to the Moluccas, while his treatment of the mutineers had given umbrage at court. Hence he returned to England; and being introduced to the Duke of Somerset, then lord protector, a new office was erected for him: he was made governor of the mystery and company of the merchant-adventurers for the discovery of regions, dominions, islands, and places unknown; a pension was granted him, by letters-patent, of 166l. 13s. 4d. per annum; and he was consulted in all affairs relative to trade. In 1522, by his interest, the court fitted out some ships for the discovery of the northern parts of the world. This produced the first voyage the English made to Russia, and the beginning of that commerce which has ever since been carried on between the two nations. The Russia company was now founded by a charter granted by Philip and Mary; and of this company Sebastian was appointed governor for life. He is said to be the first who took notice of the variation of the needle, and who published a map of the world. The exact time of his death is not known, but he lived to be above 70 years of age.

CABRA, a town of the kingdom of Tombut in Africa. It is a large town, but without walls; and is seated on the river Niger, about 12 miles from Tombut. The houses are built in the shape of bells; and

the walls are made with stakes or hurdles, plastered with clay, and covered with reeds after the manner of thatch. This place is very much frequented by negroes who come here by water to trade. The town is very unhealthy, which is probably owing to its low situation. The colour of the inhabitants is black, and their religion a sort of Mahometanism. They have plenty of corn, cattle, milk, and butter; but salt is very scarce. The judge who decides controversies is appointed by the king of Tombut. E. Long. 0. 50. N. Lat. 14. 21.

CABUL, or GABOUL, a city of Asia, and capital of the province of Cabulistan. It lies in E. Long. 68. 15. N. Lat. 33. 30. on the frontiers of Great Bukharia, on the south side of the mountains which divide the territories of the Mogul from that part of Great Tartary. It is one of the finest places in that part of the world; large, rich, and very populous. As it is considered as the key of the great Mogul's dominions on that side, great care is taken to keep its fortifications in repair, and a numerous garrison is maintained for its security. It lies on the road between Samarcand and Lahor; and is much frequented, by the Tartars, Persians, and Indians. The Ussbec Tartars drive there a great trade in slaves and horses, of which it is said that no fewer are sold than 60,000 annually. The Persians bring black cattle and sheep, which renders provisions very cheap. They have also wine, and plenty of all sorts of eatables. The city stands on a little river which falls into the Indus, and thereby affords a short and speedy passage for all the rich commodities in the country behind it, which, when brought to Cabul, are there exchanged for slaves and horses, and then conveyed by merchants of different countries to all parts of the world. The inhabitants are most of them Indian pagans, though the officers of the Mogul and most of the garrison are Mahometans.

CABULISTAN, a province of Asia, formerly belonging to the Great Mogul; but ceded in 1739 to Kouli Khan, who at that time governed Persia. It is bounded on the north by Bukharia, on the east by Caschmire, on the west by Zabulistan and Candahar, and on the south by Multan. It is 250 miles in length, 240 in breadth, and its chief town is Cabul. This country in general is not very fruitful; but in the vales they have good pasture-lands. The roads are much infested with banditti; which obliges the natives to have guards for the security of travellers. The religion of the Cabulistan is pagan; and their extraordinary time of devotion is the full moon in February, and continues for two days. At this time they are clothed in red, make their offerings, dance to the sound of the trumpet, and make visits to their friends in masquerade dresses. They say, their god Crusman killed a giant who was his enemy, and that he appeared like a little child; in memory of which, they cause a child to shoot at the figure of a giant. Those of the same tribe make bonfires, and feast together in a jovial manner. The moral part of their religion consists in charity; for which reason, they dig wells and build houses for the accommodation of travellers. They have plenty of provisions, mines of iron, myrobolans, aromatic woods, and drugs of many kinds. They carry on a great trade with the neighbouring countries; by which means they are very rich, and are supplied with plenty of all things.

CABURNS,

Cabul,
Cabulistan.

Caburns,
Cacalia.

CABURNS, on ship-board, are small lines made of spun yarn, to bind cables, seize tackles, or the like.

CACALIA, in botany; a genus of the polygamia æqualis order, belonging to the syngenesia class of plants. The receptacle is naked; the pappus hairy; the calyx cylindrical, oblong, and caliculated, or having a small calyx of very short scales only at the base.

Species. 1. The suaveolens, with a herbaceous stalk, is a native of North America. It hath a perennial creeping root which sends out many stalks, garnished with triangular spear-shaped leaves sharply sawed on their edges, of a pale green on their under side, but a deep shining green above, placed alternately. The stalks rise to the height of seven or eight feet, and are terminated by umbels of white flowers, which are succeeded by oblong seeds covered with down. It flowers in August, and the seeds ripen in October. The stalks decay in autumn, and new one rises in the spring. This plant multiplies greatly by its spreading roots, as also by the seeds, which are spread to a great distance by the wind, the down which adheres to them being greatly assisting to their conveyance. The roots which have been cast out of Chelsea garden, being carried by the tide to a great distance, have fixed themselves to the banks of the river, and increased so much, that in a few years this species may probably appear as a native of England. 2. The ficoides is a native of the Cape of Good Hope. It rises with strong round stalks to the height of seven or eight feet, woody at bottom, but soft and succulent upward, sending out many irregular branches, garnished more than half their length with thick, taper, succulent leaves, a little compressed on two sides, ending in points, covered with a whitish glaucous farina, which comes off when handled. These, when broken, emit a strong odour of turpentine, and are full of a viscid juice; at the extremity of the branches the flowers are produced in small umbels; they are white, tubulous, and cut into five parts at the top. The leaves of this plant are pickled by the French, who esteem them much; and in doing this they have a method of preserving the white farina upon them, which adds greatly to the beauty of the pickle when brought to table. 3. The kleinia, with a compound shrubby stalk, grows naturally in the Canary islands, but has long been cultivated in the English gardens. It rises with a thick fleshy stem divided at certain distances, as it were, into so many joints. Each of these divisions swell much larger in the middle than they do at each end; and the stalks divide into many irregular branches of the same form, which, toward their extremities, are garnished with long, narrow, spear-shaped leaves of a glaucous colour, standing all round the stalks without order. As they fall off, they leave a scar at the place, which always remains on the branches. The flowers are produced in large clusters at the extremity of the branches, which are tubulous, and of a faint carnation colour. They appear in August and September, but continue great part of October, and are not succeeded by seeds in this country. There have been stones and fossils dug up at a very great depth in some parts of England having very perfect impressions of this plant upon them; from whence Dr Woodward has supposed the plants were lodged there at the universal deluge; and finding the impressions of many other plants and animals which are natives of those islands, he concludes that the water flowed hither from the south-west. This plant has

been called the *cabbage-tree*, from the resemblance which the stalk of it has to the cabbage: others have intitled it *carnation-tree*, from the shape of the leaves and the colour of the flowers. Besides these, there are seven other species, viz. the alpina, with kidney-shaped leaves; the glabra, with smooth leaves; the atriplicifolia, with heart-shaped sinuated leaves; the papillaris, with a shrubby stalk guarded on every side with broken rough footstalks; the ante-euphorbium, with oblong oval leaves; the sonchifolia, with lyre-shaped indented leaves; and the lutea, with leaves divided into five acute parts.

Culture. The three species described above are very easily propagated. The first will propagate itself, as already mentioned, either by roots or seeds. The second is easily propagated by cuttings during the summer months: These should be cut from the plants and laid to dry a fortnight, that the wound may be healed over before they are planted. Most people plunge the pots in which these are planted into an hot-bed, to promote their putting out roots; but if planted in June or July, they will root as well in the open air. Even branches broken off by accident have frequently put out roots when fallen on the ground, without any care. These branches may be kept six months out of the ground, and will take root if planted. This should have a light sandy earth, and in winter be placed in an airy glass-case, where they may enjoy the sun and air in mild weather, but must be protected from frost. During the winter season the plants must have but little water; and in summer, when they are placed in the open air, it should not be given to them too often, nor in great quantity. The third is also propagated by cuttings, and the plants require the same culture; but must have a dry warm glass-case in winter, and very little water, being subject to rot with wet. In summer they must be placed in the open air in a warm sheltered situation, and in very dry weather refreshed moderately with water. With this management the plants will flower annually, and grow to the height of eight or ten feet.

CACAO. See THEOBROMA.

CACCOONS. See FLEWILLEA.

CACERES, a town of Spain, in the province of Estremadura, is seated on the river Saler, and noted for the exceeding fine wool which the sheep bear in the neighbourhood. Between this town and Brocos, there is a wood, where the allies defeated the rear-guard of the duke of Berwick, on the 7th of April 1706. E. Long. 6. 47. N. Lat. 39. 15.

CACHALOT, in ichthyology. See PHYSETER.

CACHAN, or **CASHAN**, a considerable town of Persia in Irac Agemi, where they carry on an extensive trade in silks, silver, and gold brocades, and fine earthen ware. It is situated in a vast plain, 55 miles from Isaphan. E. Long. 50. 2. N. Lat. 34. 10.

CACHAO, a province of the kingdom of Tonquin in Asia, situated in the heart of the kingdom, and surrounded by the other seven. Its soil is fertile, and in some places mountainous, abounding with variety of trees, and particularly that of varnish. Most of these provinces carry on some branch of the silk manufacture, but this most of all. It takes its name from the capital, which is also the metropolis of the whole kingdom, though in other respects hardly comparable to a Chinese one of the third rank.

CACHAO, a city of the province of that name, in the kingdom of Tonquin in Asia, situated in E. Long.

Cacalia

||
Cachan.

Cachao. 105. 31. N. Lat. 22. 10. at about 80 leagues distance from the sea. It is prodigiously crowded with people, infomuch that the streets are hardly passable, especially on market days. These vast crowds, however, come mostly from the neighbouring villages; upon which account these villages have been allowed their halls in particular parts of the city, where they bring and dispose of their wares. The town itself, though the metropolis of the whole Tonquinese kingdom, hath neither walls nor fortifications. The principal streets are wide and airy, but the rest of them narrow and ill-paved; and except the palace royal and arsenal, the town hath little else worth notice. The houses are low and mean, mostly built of wood and clay, and not above one story high. The magazines and warehouses belonging to foreigners are the only edifices built of brick; and which, though plain, yet, by reason of their height and more elegant structure, make a considerable show among those rows of wooden huts. From the combustibility of its edifices, this city suffers frequent and dreadful conflagrations. These spread with such surprising velocity, that some thousands of houses are often laid in ashes before the fire can be extinguished. To prevent these sad consequences, every house hath, either in its yard or even in its centre, some low building of brick, in form of an oven, into which the inhabitants on the first alarm convey their most valuable goods. Besides this precaution, which every family takes to secure their goods, the government obliges them to keep a cistern, or some other capacious vessel, always full of water on the top of their house, to be ready on all occasions of this nature; as likewise a long pole and bucket, to throw water from the kennel upon the houses. If these two expedients fail of suppressing the flames, they immediately cut the straps which fasten the thatch to the walls, and let it fall in and waste itself on the ground. The king's palace stands in the centre of the city; and is surrounded with a stout wall, within whose cincture are seen a great number of apartments two stories high, whose fronts and portals have something of the grand taste. Those of the king and his wives are embellished with variety of carvings and gildings after the Indian manner, and all finely varnished. In the outer court are a vast number of sumptuous stables for the king's horses and elephants. The appearance of the inner courts can only be conjectured; for the avenues are not only shut to all strangers, but even to the king's subjects, except those of the privy council, and the chief ministers of state: yet we are told, that there are stair-cases by which people may mount up to the top of the walls, which are about 18 or 20 feet high; from whence they may have a distant view of the royal apartments, and of the fine parterres and fish-ponds that are between the cincture and them. The front wall hath a large gate well ornamented, which is never opened but when the king goes in and out; but at some distance from it on each side there are two posterns, at which the courtiers and servants may go in and out. This cincture, which is of a vast circumference, is faced with brick within and without, and the whole structure is terminated by wide spacious gardens; which, though stored with great variety of proper ornaments, are destitute of the grandeur and elegance observed in the palaces of European princes. Besides this palace, the ruins of one still more magnificent are to be observed, and are called *Libatvia*.

The circumference is said to have been betwixt six and seven miles: some arches, porticoes, and other ornaments, are still remaining; from which, and some of its courts paved with marble, it may be concluded to have been as magnificent a structure as any of the eastern parts can show. The arsenal is likewise a large and noble building, well stored with ammunition and artillery. The English factory is situated on the north side of the city, fronting the river *Song-koy*. It is a handsome low-built house, with a spacious dining-room in the centre; and on each side are the apartments of the merchants, factors, and servants. At each end of the building are smaller houses for other uses, as store-houses, kitchen, &c. which form two wings with the square in the middle, and parallel with the river, near the bank of which stands a long flag-staff, on which they commonly display the English colours on Sundays and all remarkable days. Adjoining to it, on the south side, is the Danish factory, which is neither so large nor so handsome. On the same side of the river runs a long dike, whose timber and stones are so firmly fastened together, that no part of it can be stirred without moving the whole. This work was raised on those banks to prevent the river, during the time of their vast rains, from overflowing the city; and it has hitherto answered its end; for though the town stands high enough to be in no danger from land-floods, it might yet have been otherwise frequently damaged, if not totally laid under water, by the overflowing of that river. Some curious observations have been communicated to the royal society concerning differences between the tides of those seas and those of Europe, viz. that on the Tonquinese coast ebbs and flows but once in 24 hours; that is, that the tide is rising during the space of 12 hours, and can be easily perceived during two of the moon's quarters, but can hardly be observed during the other two. In the spring tides, which last 14 days, the waters begin to rise at the rising of the moon; whereas in the low tides, which continue the same number of days, the tide begins not till that planet is got below the horizon. Whilst it is passing through the six northern signs, the tides are observed to vary greatly, to rise sometimes very high, and sometimes to be very low; but when it is once got into the southern part of the zodiac, they are then found to be more even and regular.

CACHECTIC, something partaking of the nature of, or belonging to, a cachexy.

CACHEO, a town of Negroland in Africa, seated on the river St Domingo. It is subject to the Portuguese, who have three forts there, and carry on a great trade in wax and slaves. W. Long. 14. 55. N. Lat. 12. 0.

CACHEXY, in medicine, a vicious state of the humours and whole habit. See (the Index subjoined to) **MEDICINE**.

CACHRYS, in botany: A genus of the digynia order belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellata*. The fruit is subovate, angled, and cork or spongy rinded.

There are five species, viz. the trifida, with bipinnated leaves; the ficula, with double winged leaves; the libanotis, with smooth furrowed seeds; the linearia, with plain channelled fruit; and the hungarica, with a plain, fungous, channelled seed. All these are perennial.

Cachunde
||
Cactus.

Cacus
||
Cadence.

ennial plants, rising pretty high, and bearing large umbels of yellow flowers, and may be propagated by seeds which ought to be sown soon after they are ripe; for if they are kept out of the ground till the next spring, they often miscarry. They must also be sown in a shady border where they are to remain: for the plants, having long top-roots, will not bear transplanting so well as many others. The Hungarians in the neighbourhood of Erlaw, and those who border on Transylvania, Servia, &c. eat the root of the fifth species in a scarcity of corn for want of other bread.

CACHUNDE, the name of a medicine, highly celebrated among the Chinese and Indians, and made of several aromatic ingredients, the perfumes, medicinal earth, and precious stones: they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dried for use: these are principally used in the East Indies, but are sometimes brought over to Portugal. In China, the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. It is a highly valuable medicine also, in all nervous complaints; and is esteemed a prolonger to life, and a provocative to venery, the two great intentions of most of the medicines in use in the East.

CACOCHYLIA, or CACOCHYMIA, a vicious state of the vital humours, especially of the mass of blood; arising either from a disorder of the secretions or excretions, or from external contagion. The word is Greek, compounded of *κακός* ill, and *χυμός* juice.

CACOPHONIA, in grammar and rhetoric, the meeting of two letters, or syllables, which yield an uncouth and disagreeable sound. The word is compounded of *κακός* evil, and *φωνή*, voice.

CACOPHONIA, in Medicine, denotes a vice or deprivation of the voice or speech; of which there are two species, *aphonia* and *dysphonia*.

CACTUS, in botany: A genus of the monogynia order, belonging to the icofandria class of plants; and in the natural method ranking under the 13th order, *Succulentæ*. The calyx is monophyllous; superior, or above the receptacle of the fruit imbricated; the corolla polypetalous; the fruit an unilocular, polyspermous berry. To this genus Linnæus has added the *cereus* and *opuntia*. There are 24 species, all natives of the West Indies and Mexico.

The cacti are plants of a singular structure, but especially the larger kinds of them; which appear like a large, fleshy, green melon, with deep ribs, set all over with strong sharp thorns; and, when the plants are cut through the middle, their inside is a soft, pale-green, fleshy substance, very full of moisture. The fruit of all the species is frequently eaten by the inhabitants of the West Indies. The fruits are about three quarters of an inch in length, of a taper form, drawing to a point at the bottom toward the plant, but blunt at the top where the empalement of the flower was situated. The taste is agreeably acid, which in a hot country must render the fruit more grateful.

The cochineal animals are supported on a species called *cactus cochenillifer*.—The flower of the cactus grandiflora (one of the creeping *cereuses*) is said to be as grand and beautiful as any in the vegetable system: It begins to open in the evening about seven o'clock, is in perfection about eleven, and fades about four in

No. 61.

the morning; so that the same flower only continues in perfection about six hours. The calyx when expanded is about a foot in diameter, of a splendid yellow within, and a dark brown without; the petals are many, and of a pure white; and the great number of recurved stamina, surrounding the style in the centre of the flower, make a grand appearance, to which may be added the fine scent, which perfumes the air to a considerable distance. It flowers in July.

CACUS, in fabulous history, an Italian shepherd upon mount Aventine. As Hercules was driving home the herd of king Geryon whom he had slain, Cacus robbed him of some of his oxen, which he drew backward into his den lest they should be discovered. Hercules at last finding them out by their lowing, or the robbery being discovered to him, killed Cacus with his club. He was Vulcan's son, of prodigious bulk, and half man half satyr.

CADAN, a town of Bohemia, in the circle of Zats, seated on the northern bank of the river Egra, in E. Long. 13. 34. N. Lat. 50. 20.

CADARI, or KADARI, a sect of Mahometans, who assert free-will; attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predestination. The author of this sect was Mabel ben Kaled Al Gihoni, who suffered martyrdom for it. The word comes from the Arabic, *قادار*, *cadara*, power. Ben Aun calls the Cadarians the Magi, or Manichees of the Mussulmen.

CADE, a cag, cask, or barrel. A cade of herrings is a vessel containing the quantity of 500 red herrings, or 1000 sprats.

CADE-Lamb, a young lamb weaned, and brought up by hand, in a house; called in the North, *pet-lamb*.

CADRE-Oil, in the *Materia Medica*, a name given to an oil much in use in some parts of France and Germany. The physicians call it *oleum cadae*, or *oleum de cada*. This is supposed by some to be the pisselæum of the ancients, but improperly; it is made of the fruit of the oxycedrus, which is called by the people of these places *cada*.

CADRE-Worm in zoology, the maggot or worm of a fly called *phryganea*. It is used as a bait in angling. See PHRYGANEAE.

CADEA, or THE LEAGUE OF THE HOUSE OF GOD, is one of those that compose the republic of the Grisons, and the most powerful and extensive of them all. It contains the bishopric of Coire, the great valley of Engadine, and that of Bragail or Pregal. Of the 11 great, or 21 small communities, there are but two that speak the German language; that of the rest is called the *Rhetic*, and is a dialect of the Italian. The Protestant religion is most prevalent in this league, which has been allied to the Swiss cantons ever since the year 1498. Coire is the capital town.

CADENAC, a town of France in Querci, on the confines of Rouergue, seated on the river Lot, in E. Long. 2. 12. N. Lat. 44. 36.

CADENCE, or REPOSE, in music, (from the Latin *cadere* to fall or descend); the termination of an harmonical phrase on a repose, or on a perfect chord. See MUSIC, art. 73—76, and 132—137.

CADENCE, in reading, is a falling of the voice below the key-note at the close of every period. In reading, whether prose or verse, a certain tone is assumed which is called the *key-note*; and in this tone the bulk of the words,

Cadence
||
Cadi.

words are founded; but this note is generally lowered towards the close of every sentence.

CADENCE, in the manege, an equal measure or proportion, observed by a horse in all his motions; so that his times have an equal regard to one another, the one does not embrace or take in more ground than the other, and the horse observes his ground regularly.

CADENE, one of the sorts of carpets which the Europeans import from the Levant. They are the worst sort of all, and are sold by the piece from one to two piastres per carpet.

CADENET, a town of France in Provence, and in the Viguirie of Apt. E. Long. 5. 30. N. Lat. 43. 40.

CADES, or KADESH, (anc. geog.) a town in the Wilderness of Zin, in Arabia Petræa; the first encampment of the Israelites, after their departure from Eziongeber; and from which the Wilderness of Zin was called Cades; the burial-place of Miriam, with the rock and water of Meribah in it. Another *Cades*, a town of the tribe of Judah, Joshua xv. 23. *Cadef-barnea*, called also *Cades*.

CADESBARNEA, (anc. geog.) a town of the Wilderness of Paran, on the confines of Canaan, from which the spies were sent out; sometimes simply called *Cades*, but distinct from the Cades in the Wilderness of Zin.

CADET, the younger son of a family, is a term naturalized in our language from the French. At Paris, among the citizens, the cadets have an equal patrimony with the rest. At Caux, in Normandy, the custom, as with us, is to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

CADET is also a military term denoting a young gentleman who chooses to carry arms in a marching regiment as a private man. His views are, to acquire some knowledge in the art of war, and to obtain a commission in the army. Cadet differs from volunteer, as the former takes pay, whereas the latter serves without pay.

CADI, or CADHI, a judge of the civil affairs in the Turkish empire. It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of *mollas*.

We find numerous complaints of the avarice, iniquity, and extortion, of the Turkish cadis; all justice is here venal; the people bribe the cadis, the cadis bribe the moulas, the moulas the cadilefchers, and the cadilefchers the mufti. Each cadi has his serjeants, who are to summon persons to appear and answer complaints. If the party summoned fails to appear at the hour appointed, sentence is passed in favour of his adversary. It is usually vain to appeal from the sentences of the cadi, since the affair is never heard anew, but judgment is passed on the case as stated by the cadi. But the cadis are often cashiered and punished for crying injustice with the bastinado and mulcts; the law, however, does not allow them to be put to death. Constantinople has had cadis ever since the year 1390, when Bajazet I. obliged John Paleologus, emperor of the Greeks, to receive cadis into the city to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the cadis

VOL. IV. Part I.

are also judges of religious matters. Among the Moors, cadis is the denomination of their higher order of priests or doctors, answering to the rabbins among the Jews.

CADIACI, the Turkish name of Chalcedon. See CHALCEDON.

CADILESCHER, a capital officer of justice among the Turks, answering to a chief justice among us.

It is said, that this authority was originally confined to the soldiery; but that, at present, it extends itself to the determination of all kinds of law-suits; yet is nevertheless subject to appeals.

There are but three cadilefchers in all the grand signior's territories: the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This last is the most considerable: they have their seats in the divan next to the grand vizir.

CADILLAC, a town of France in Guienne, and in Bazadois, near the river Garonne, with a handsome castle, situated in W. Long. 0. 15. N. Lat. 44. 37.

CADÍZ, a city and port-town of Andalusia in Spain, situated on the island of Leon, opposite to Port St Mary on the continent, about 60 miles south-west of Seville, and 40 north-west of Gibraltar. W. Long. 6. 40. N. Lat. 36. 30.

It occupies the whole surface of the western extremity of the island, which is composed of two large circular parts, joined together by a very narrow bank of sand, forming altogether the figure of a chain-shot. At the south-east end, the ancient bridge of Suaço, thrown over a deep channel or river, affords a communication between the island and the continent; a strong line of works defends the city from all approaches along the isthmus; and, to render them still more difficult, all the gardens and little villas on the beach were in 1762 cleared away, and a dreary sandy glacis left in their room, so that now there is scarce a tree on the whole island.

Except the *Calle Ancha*, all the streets are narrow, ill-paved, and insufferably stinking. They are all drawn in straight lines, and most of them intersect each other at right angles. The swarms of rats that in the nights run about the streets are innumerable; whole droves of them pass and repass continually, and these their midnight revels are extremely troublesome to such as walk late. The houses are lofty, with each a vestibule, which being left open till night, serve passengers to retire to; this custom, which prevails throughout Spain, renders these places exceedingly offensive. In the middle of the house is a court like a deep well, under which is generally a cistern, the breeding-place of gnats and mosquitos; the ground-floors are warehouses, the first stories counting-house or kitchen, and the principal apartment up two pair of stairs. The roofs are flat, covered with an impenetrable cement, and few are without a *mirador* or turret for the purpose of commanding a view of the sea. Round the parapet-wall at top are placed rows of square pillars, meant either for ornament according to some traditional mode of decoration, or to fix awnings to, that such as sit there for the benefit of the sea-breeze may be sheltered from the rays of the sun; but the most common use made of them, is to fasten ropes for drying linen upon. High above all these pinnacles, which give Cadiz a most singular appearance, stands

Cadisei
||
Cadiz.

Cadiz. the tower of signals. Here flags are hung out on the first sight of a sail, marking the size of the ship, the nation it belongs to, and, if a Spanish Indiaman, the port of the Indies it comes from. The ships are acquainted with the proper signals to be made, and these are repeated by the watchmen of the tower: as painted lists are in every house, persons concerned in commerce soon learn the marks.

The city is divided into twenty-four quarters, under the inspection of as many commissioners of police; and its population is reckoned at one hundred and forty thousand inhabitants, of which twelve thousand are French, and at least as many more Italians. The square of Saint Antonio is large, and tolerably handsome, and there are a few smaller openings of no great note. The public walk, or Alameda, is pleasant in the evening: it is fenced off the coach-road by a marble rail. The sea-air prevents the trees from thriving, and destroys all hopes of future shade.

From the Alameda, continuing your walk westwards, you come to the Campofanto, a large esplanade, the only airing-place for coaches; it turns round most part of the west and south sides of the island, but the buildings are straggling and ugly; the only edifice of any show is the new orphan-house; opposite to it is the fortress of St Sebastian, built on a neck of land running out into the sea. The round tower at the extremity is supposed to have saved the city, in the great earthquake of 1755, from being swept away by the fury of the waves. The building proved sufficiently solid to withstand the shock, and break the immense volume of water that threatened destruction to the whole island. In the narrow part of the isthmus the surge beat over with amazing impetuosity, and bore down all before it; among the rest, the grandson of the famous tragic-poet Racine, who strove in vain to escape, by urging his horse to the utmost of his speed. On St Sebastian's feast, a kind of wake or fair is held in the fort; an astonishing number of people then passing and repassing, on a string of wooden bridges laid from rock to rock, makes a very lively moving picture.

From hence to the wooden circus where they exhibit the bull-feasts, you keep turning to the left close above the sea, which on all this side dashes over large ledges of rock; the shore seems here absolutely inaccessible. On this shore stands the cathedral, a work of great expence, but carried on with so little vigour, that it is difficult to guess at the term of years it will require to bring it to perfection. The vaults are executed with great solidity. The arches, that spring from the clustered pilasters to support the roof of the church, are very bold; the minute sculpture bestowed upon them seems superfluous, as all the effect will be lost from their great height, and from the shade that will be thrown upon them by the filling up of the interstices. From the sea, the present top of the church resembles the carcase of some huge monster cast upon its side, rearing its gigantic blanched ribs high above the buildings of the city. The outward casings are to be of white marble, the bars of the windows of bronze.

Next, crossing before the land-gate and barracks, a superb edifice for strength, convenience, and cleanliness, you come down to the ramparts that defend the city on the side of the bay. If the prospect to the

ocean is solemn, that towards the main land is animated in the highest degree; the men of war ride in the eastern bosom of the bay; lower down the merchantmen are spread far and near; and close to the town an incredible number of barks, of various shapes and sizes, cover the surface of the water, some moored and some in motion, carrying goods to and fro. The opposite shore of Spain is studded with white houses, and enlivened by the towns of St Mary's, Port-real, and others, behind which, eastward, on a ridge of hills, stands Medina Sidonia, and further back rise the mountains of Granada. Westward, Rota closes the horizon, near which was anciently the island and city of Tartessus, now covered by the sea, but at low-water some part of the ruins are still to be discerned. In a large bastion, jutting out into the bay, they have built the custom-house, the first story of which is level with the walk upon the walls. When it was resolved to erect a building so necessary to this great emporium of trade, the marquis di Squillace gave orders that no expence should be spared, and the most intelligent architects employed, in order to erect a monument, which by its taste and magnificence might excite the admiration of posterity: the result of these precautions proved a piece of vile architecture, composed of the worst of materials.

The stir here is prodigious during the last months of the stay of the flota. The packers possess the art of pressing goods in great perfection; but, as they pay the freight according to the cubic palms of each bale, they are apt to squeeze down the cloths and linens so very close and hard, as sometimes to render them unfit for use. The exportation of French luxuries in dress is enormous; Lyons furnishes most of them; England sends out bale goods; Brittany and the north, linens. Every commercial nation has a consul resident at Cadiz; those of England and France are the only ones not allowed to have any concern in trade.

In 1596, Cadiz was taken, pillaged, and burnt by the English; but in 1702 it was attempted in conjunction with the Dutch, without success.

CADIZADELITES, a sect of Mahometans very like the ancient stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahometanism; they drink wine, even in the fast of the ramazan; they love and protect the Christians; they believe that Mahomet is the Holy Ghost, practise circumcision, and justify it by the example of Jesus Christ.

CADMEAN LETTERS, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phœnicia; whence Herodotus also calls them *Phœnician letters*.—According to some writers, Cadmus was not the inventor, nor even importer of the Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation *Cadmean* or *Phœnician letters*; whereas before that time they had been called *Pelasgian letters*.

CADMIA. See **CALAMINE**.

CADMUS, in fabulous history, king of Thebes, the son of Agenor king of Phœnicia, and the brother of Phoenix, Cilix, and Europa. He carried into Greece the 16 simple letters of the Greek alphabet; and there built Thebes, in Bœotia. The poets say, that

Cadiz.

Cadmus.

Cadmus
||
Caduceus.

that he left his native country in search of his sister Europa, whom Jupiter had carried away in the form of a bull; and that, inquiring of the Delphic oracle for a settlement, he was answered, that he should follow the direction of a cow, and build a city where she lay down. Having arrived among the Phocenses, he was met by a cow, who conducted him through Bœotia to the place where Thebes was afterwards built: but as he was about to sacrifice his guide to Pallas, he sent two of his company to the fountain Dirce for water; when they being devoured by a serpent or dragon, he slew the monster, and afterwards, by the advice of Pallas, sowed his teeth, when there sprung up a number of armed soldiers, who prepared to revenge the death of the serpent; but on his casting a stone among these upstart warriors, they turned their weapons against each other with such animosity, that only five survived the combat, and these assisted Cadmus in founding his new city. Afterwards, to recompence his labours, the gods gave him Harmonia, or Hermione, the daughter of Mars and Venus; and honoured his nuptials with presents and peculiar marks of favour. But at length resigning Thebes to Pentheus, Cadmus and Hermione went to govern the Eccellenenses: when grown old, they were transformed into serpents; or, as others say, sent to the Elysian fields, in a chariot drawn by serpents. See THEBES.

CADMUS of Miletum, a celebrated Greek historian, was, according to Pliny, the first of the Greeks who wrote history in prose. He flourished about 550 before Christ.

CADORE, or PIEVE DE CADORE, a town of Italy, in the territory of Venice, and capital of a district called *Cadorino*; famous for the birth of Titian the painter. E. Long. 13. 45. N. Lat. 46. 25.

CADORINO, a province of Italy, in the territory of Venice; bounded on the east by Friuli Proper, on the south and west by the Bellunese, and by the bishopric of Brixen on the north. It is a very mountainous country, but pretty populous. The only town is Pieve de Cadore.

CADRITES, a sort of Mahometan friars, who once a-week spend a great part of the night in turning round, holding each others hand, and repeating incessantly the word *hai*, which signifies *living*, and is one of the attributes of God; during which one of them plays on a flute. They never cut their hair, nor cover their heads; and always go barefooted: they have liberty to quit their convent when they please, and to marry.

CADSAND, an island on the coast of Dutch Flanders, situated at the mouth of the Scheld, where by the Dutch command the navigation of that river.

CADUCEUS, in antiquity, Mercury's rod or sceptre, being a wand entwisted by two serpents borne by that deity as the ensign of his quality and office, given him, according to the fable, by Apollo, for his seven-stringed harp. Wonderful properties are ascribed to this rod by the poets; as laying men asleep, raising the dead, &c.

It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin and a caduceus, offering them their choice either of war or peace. Among that people, those who denounced war were called *feciales*; and those who went

to demand peace, *caduceatores*, because they bore a caduceus in their hand.

The caduceus found on medals is a common symbol, signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

CADUCI, (from *cado* to "fall"); the name of a class in Linnæus's *calycina*, consisting of plants whose calyx is a simple perianthium, supporting a single flower or fructification, and falling off either before or with the petals. It stands opposed to the *classes persistentes* in the same method, and is exemplified in mustard and ranunculus.

CADURCI, CADURCUM, *Cadurcus*, and *Cadurx*, (anc. geog.), a town of the Cadurci, a people of Aquitania; situated between the rivers Oldus, running from the north, and the Tarnis from the south, and falling into the Garumna: now *Cabors*, capital of the territory of the Querci, in Guienne. A part of the Cadurci, to the south next the Tarnis, were called *E-leutheri*.

CADUS, in antiquity, a wine-vessel of a certain capacity, containing 80 amphoræ or firkins; each of which, according to the best accounts, held nine gallons.

CADUSII (anc. geog.), a people of Media Atropatene, situated to the west in the mountains, and reaching to the Caspian sea; between whom and the Medes, perpetual war and enmity continued down to the time of Cyrus.

CÆCILIA, in zoology, a genus of serpents belonging to the amphibia class. The cæcilia has no scales; it is smooth, and moves by means of lateral rugæ or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are but two species of this serpent, viz. 1. The tentaculata, has 135 rugæ. It is about a foot long, and an inch in circumference, preserving an uniform cylindrical shape from the one end to the other. The teeth are very small. It has such a resemblance to an eel, that it may easily be mistaken for one; but as it has neither fins nor gills, it cannot be classed with the fishes. It is a native of America, and its bite is not poisonous. 2. The glutinosa, has 340 rugæ or prickles above, and 10 below, the anus. It is of a brownish colour, with a white line on the side, and is a native of the Indies.

CÆCUM, or COECUM, the blind gut. See ANATOMY, N° 93.

CÆLIUM (anc. geog.), an inland town of Peucetia, a division of Apulia; a place four or five miles above Barium or Bari, and which still retains that name.

CÆLIUS MONS, (Itinerary); a town of Vindelicia, on the right or west side of the Ilargus. Now *Kelmuntz*, a small town of Suabia, on the Iller.

CÆLIUS MONS at Rome. See COELIUS.

CÆLIUS (Aurelianus), an ancient physician, and the only one of the sect of the methodists of whom we have any remains. He was of Sicca, a town of Numidia; but in what age he lived, cannot be determined: it is probable, however, that he lived before Galen; since, though he carefully mentions all the physicians before him, he takes no notice of Galen. He had read over very diligently the ancient physicians

then-shire

cians of all sects; and we are indebted to him for the knowledge of many dogmas which are not to be found but in his books *de celeribus et tardis passionibus*. He wrote, as he himself tells us, several other works; but they are all perished.

CAEN, an handsome and considerable town of France, capital of Lower Normandy, with a celebrated university, and an academy of literature. It contains 60 streets, and 12 parishes. It has a castle with four towers, which were built by the English. The town-house is a large building with four great towers. The royal square is the handsomest in all Normandy, and has fine houses on three sides of it; and in the middle is the statue of Louis XIV. in a Roman habit, standing on a marble pedestal, and surrounded with an iron ballustrade. It is seated in a pleasant country on the river Orne, about eight miles from the sea. William the conqueror was buried here, in the abbey of St Stephen, which he founded. W. Long. o. 27. N. Lat. 49. 11.

CÆRE, (anc. geog.), a town of Etruria, the royal residence of Mezentius. Its ancient name was *Argyllæ*. In Strabo's time not the least vestige of it remained, except the baths called *cæretana*. From this town the Roman censor's tables were called *cærites tabule*. In these were entered the names of such as for some misdemeanor forfeited their right of suffrage, or were degraded from a higher to a less honourable tribe. For the people of Cære hospitably receiving those Romans who, after the taking of Rome by the Gauls, fled with their gods and the sacred fire of Vesta, were, on the Romans recovering themselves from this disaster, honoured with the privilege of the city, but without a right of voting.

CÆRITES TABULÆ. See the preceding article.

CAERFILLY, a town of Glamorganshire in South Wales, seated between the rivers Taff and Rumney, in a moorish ground, among the hills. It is thought the walls, now in ruins, were built by the Romans; there being often Roman coins dug up there. W. Long. 3. 12. N. Lat. 51. 25.

CAERLEON, a town of Monmouthshire in England, and a place of great antiquity. It was a Roman town, as is evident from the many Roman antiquities found here. It is commodiously situated on the river Usk, over which there is a large wooden bridge. The houses are generally built of stone, and there are the ruins of a castle still to be seen. W. Long. 3. o. N. Lat. 51. 40.

CAERMARTHEN-SHIRE, a county of Wales, bounded on the north by Severn sea or St George's Channel, Cardiganshire on the south, the shires of Brecknock and Glamorgan on the east, and Pembroke-shire on the west. Its greatest length is between 30 and 40 miles, and its breadth upwards of 20. The air is wholesome, and the soil less rocky and mountainous than most other parts of Wales, and consequently is proportionally more fertile both in corn and pasture. It has also plenty of wood, and is well supplied with coal and limestone. The most considerable rivers are the Towy, the Cothy, and the Tave; of which, the first abounds with excellent salmon. The principal towns are Caermarthen the capital, Kidwely, Lanimdover, &c. This county abounds with ancient forts, camps, and tumuli or barrows. Near to Caermarthen, to-

wards the east, may be seen the ruins of Kastelk Karey, which was situated on a steep and inaccessible rock; and also several vast caverns, supposed to have been copper-mines of the Romans. Near this spot is a fountain which ebbs and flows twice in 24 hours like the sea.

CAERMARTHEN, a town of Wales, and capital of the county of that name. It is situated on the river Fowey, over which it has a fine stone-bridge. It is of great antiquity, being the Maridunum of Ptolemy. It is a populous, thriving, and polite place, many of the neighbouring gentry residing there in the winter. It is a corporation and county of itself, with power to make by-laws. Here were held the courts of chancery and exchequer for South Wales, till the whole was united to England in the reign of Henry VIII. Here was born the famous conjurer Merlin; and near the town is a wood called *Merlin's grove*, where he is said to have often retired for contemplation. Many of his pretended prophecies are still preserved in the country. The town gives the title of *marquis* to his grace the duke of Leeds. It sends one member to parliament, and the county another.

CAERNARVON-SHIRE, a county of Wales, bounded on the north and west by the sea, on the south by Merionethshire, and on the east is divided from Denbighshire by the river Conway. It is about 40 miles in length, and 20 in breadth; and sends one member to parliament for the shire, and another for the borough of Caernarvon. The air is very piercing; owing partly to the snow, that lies seven or eight months of the year upon some of the mountains, which are so high that they are called the *British Alps*; and partly to the great number of lakes, which are said not to be fewer than 50 or 60. The soil in the valleys on the side next Ireland is pretty fertile, especially in barley; great numbers of black cattle, sheep, and goats, are fed on the mountains; and the sea, lakes, and rivers, abound with variety of fish. The highest mountains in the county are those called *Snowdon hills*, and *Pen-maen-mawr*, which last hangs over the sea. There is a road cut out of the rock on the side next the sea, guarded by a wall running along the edge of it on that side; but the traveller is sometimes in danger of being crushed by the fall of pieces of the rock from the precipices above. The river Conway, though its course from the lake out of which it issues to its mouth is only 12 miles, yet is so deep, in consequence of the many brooks it receives, that it is navigable by ships of good burden for eight miles. Pearls are found in a large black muscle taken in this river. The principal towns are Bangor, Caernarvon the capital, and Conway. In this county is an ancient road said to have been made by Helena the mother of Constantine the Great; and Matthew of Westminster asserts, that the body of Constantine the father of the same Constantine was found at Caernarvon in the year 1283, and interred in the parish-church there by order of Edward I.

CAERNARVON, a town of Wales, and capital of the county of that name. It was built by Edward I. near the site of the ancient Segontium, after his conquest of the country in 1282, the situation being well adapted to overawe his new subjects. It had natural requisites for strength; being bounded on one side by the arm of the sea called the *Menai*; by the estuary of the Seiont

Caernar-
then
||
Caernar-
von.

Caernarvon
||
Cæsalpina.

Seiont on another, exactly where it receives the tide from the former; on a third side, and a part of the fourth, by a creek of the Menai; and the remainder has the appearance of having the insulation completed by art. Edward undertook this great work immediately after his conquest of the country in 1282, and completed the fortifications and castle before 1284; for his queen, on April 25th in that year, brought forth within its walls Edward, first prince of Wales of the English line. It was built within the space of one year, by the labour of the peasants, and at the cost of the chieftains of the country, on whom the conqueror imposed the hateful task. The external state of the walls and castle, Mr Pennant informs us, are at present exactly as they were in the time of Edward. The walls are defended by numbers of round towers, and have two principal gates: the east, facing the mountains; the west, upon the Menai. The entrance into the castle is very august, beneath a great tower, on the front of which appears the statue of the founder, with a dagger in his hand, as if menacing his new-acquired unwilling subjects. The gate had four portcullises, and every requisite of strength. The towers are very beautiful. The Eagle tower is remarkably fine, and has the addition of three slender angular turrets issuing from the top. Edward II. was born in a little dark room in this tower, not twelve feet long nor eight in breadth: so little did, in those days, a royal consort consult either pomp or conveniency. The gate through which the affectionate Eleanor entered, to give the Welsh a prince of their own, who could not speak a word of English, is at the farthest end, at a vast height above the outside ground; so could only be approached by a draw-bridge. The quay is a most beautiful walk along the side of the Menai, and commands a most agreeable view.

Caernarvon is destitute of manufactures, but has a brisk trade with London, Bristol, Liverpool, and Ireland, for the several necessities of life. It is the residence of numbers of genteel families, and contains several very good houses. Edward I. bestowed on this town its first royal charter, and made it a free borough. Among other privileges, none of the burgesses could be convicted of any crime committed between the rivers Conway and Dyfe, unless by a jury of their own townsmen. It is governed by a mayor, who, by patent, is created governor of the castle. It has one alderman, two bailiffs, a town-clerk, and two serjeants at mace. The representative of the place is elected by its burgesses, and those of Conway, Pwllheli, Nefyn, and Crickaeth. The right of voting is in every one, resident or non-resident, admitted to their freedom. The town gives title of *earl* and *marquis* to the duke of Chandos, and has a good tide-harbour.

CAERWIS, a market-town of Flintshire in North Wales, situated in W. Long. 3. 25. N. Lat. 53. 20.

CÆSALPINIA BRASILETTO, or *Brasil-wood*: a genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 33d order, *Lomentaceæ*. The calyx is quinquefid, with the lowest segment larger in proportion. There are five petals, with the lowest more beautiful than the rest. It is a leguminous plant. Of this there are three species, the most remarkable of which is the *brasiliensis*, commonly called *Brasiletto*. It

grows naturally in the warmest parts of America; from whence the wood is imported for the dyers, who use it much. The demand has been so great, that none of the large trees are left in any of the British plantations; so that Mr Catesby owns himself ignorant of the dimensions to which they grow. The largest remaining are not above two inches in thickness, and eight or nine feet in height. The branches are slender and full of small prickles; the leaves are pinnated; the lobes growing opposite to one another, broad at their ends, with one notch. The flowers are white, papilionaceous, with many stamina and yellow apices, growing in a pyramidal spike, at the end of a long slender stalk: the pods inclose several small round seeds. The colour produced from this wood is greatly improved by solution of tin in aqua regia*. The second sort is a native of the same countries with the first, but is of a larger size. It sends out many weak irregular branches, armed with short, strong, upright thorns. The leaves branch out in the same manner as the first; but the lobes, or small leaves, are oval and entire. The flowers are produced in long spikes like those of the former, but are variegated with red. These plants may be propagated from seeds, which should be sown in small pots filled with light rich earth early in the spring, and plunged in a bed of tanner's bark. Being tender, they require to be always kept in the stove, and to be treated in the same manner as other exotics of that kind.

CÆSALPINUS of Arezzo, professor at Pisa, and afterwards physician to pope Clement VIII. one of the capital writers in botany. See BOTANY, p. 419, 420.

CÆSAR (Julius), the illustrious Roman general and historian, was of the family of the Julii, who pretended they were descended from Venus by Æneas. The descendants of Ascanius son of Æneas and Creusa, and surnamed *Julius*, lived at Alba till that city was ruined by Tullus Hostilius king of Rome, who carried them to Rome, where they flourished. We do not find that they produced more than two branches. The first bore the name of *Tullus*, the other that of *Cæsar*. The most ancient of the Cæsars were those who were in public employments in the 11th year of the first Punic war. After that time we find there was always some of that family who enjoyed public offices in the commonwealth, till the time of Caius Julius Cæsar, the subject of this article. He was born at Rome the 12th of the month Quintilis, year of the city 653, and lost his father an. 669. By his valour and eloquence he soon acquired the highest reputation in the field and in the senate. Beloved and respected by his fellow-citizens, he enjoyed successively every magisterial and military honour the republic could bestow consistent with its own free constitution. But at length having subdued Pompey the great rival of his growing power, his boundless ambition effaced the glory of his former actions: for, pursuing his favourite maxim, "that he had rather be the first man in a village than the second in Rome," he procured himself to be chosen perpetual dictator; and, not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity; when the friends of the civil liberties of the republic rashly assassinated him in the senate-house, where they should only have seized him and brought him to a legal trial for usurpation. By this

impolitic

Cæsalpinus
Cæsar.

Plate CXV.

* See Colour making and Dyeing.

Cæsar. impolitic measure they defeated their own purpose, involving the city in consternation and terror, which produced general anarchy, and paved the way to the revolution they wanted to prevent; the monarchical government being absolutely founded on the murder of Julius Cæsar. He fell in the 56th year of his age, 43 years before the Christian æra. His commentaries contain a history of his principal voyages, battles, and victories. The London edition in 1712, in folio, is preferred.

The detail of Cæsar's transactions (so far as is consistent with the limits of this work) being given under the article ROME, we shall here only add a portrait of him as drawn by a philosopher*.

* From the
Mélanges
Philosophiques
of
M. Olympe
de Gouges.

"If, after the lapse of 18 centuries, the truth may be published without offence, a philosopher might, in the following terms, censure Cæsar without calumniating him, and applaud him without exciting his blushes.

"Cæsar had one predominant passion: it was the love of glory; and he passed 40 years of his life in seeking opportunities to foster and encourage it. His soul, entirely absorbed in ambition, did not open itself to other impulses. He cultivated letters; but he did not love them with enthusiasm, because he had not leisure to become the first orator of Rome. He corrupted the one half of the Roman ladies, but his heart had no concern in the fiery ardours of his senses. In the arms of Cleopatra, he thought of Pompey; and this singular man, who disdained to have a partner in the empire of the world, would have blushed to have been for one instant the slave of a woman.

"We must not imagine, that Cæsar was born a warrior, as Sophocles and Milton were born poets. For, if nature had made him a citizen of Sybaris, he would have been the most voluptuous of men. If in our days he had been born in Pennsylvania, he would have been the most inoffensive of quakers, and would not have disturbed the tranquillity of the new world.

"The moderation with which he conducted himself after his victories, has been highly extolled; but in this he showed his penetration, not the goodness of his heart. Is it not obvious, that the display of certain virtues is necessary to put in motion the political machine? It was requisite that he should have the appearance of clemency, if he inclined that Rome should forgive him his victories. But what greatness of mind is there in a generosity which follows on the usurpation of supreme power?

"Nature, while it marked Cæsar with a sublime character, gave him also that spirit of perseverance which renders it useful. He had no sooner begun to reflect, than he admired Sylla; hated him, and yet wished to imitate him. At the age of 15, he formed the project of being dictator. It was thus that the president Montesquieu conceived, in his early youth, the idea of the spirit of laws.

"Physical qualities, as well as moral causes, contributed to give strength to his character. Nature, which had made him for command, had given him an air of dignity. He had acquired that soft and insinuating eloquence, which is perfectly suited to seduce vulgar minds, and has a powerful influence on the most cultivated. His love of pleasure was a merit with the fair sex; and women, who even in a republic can draw to

them the suffrages and attention of men, have the highest importance in degenerate times. The ladies of his age were charmed with the prospect of having a dictator whom they might subdue by their attractions.

"In vain did the genius of Cato watch for some time to sustain the liberty of his country. It was unequal to contend with that of Cæsar. Of what avail were the eloquence, the philosophy, and the virtue of this republican, when opposed by a man who had the address to debauch the wife of every citizen whose interest he meant to engage; who, possessing an enthusiasm for glory, wept, because, at the age of 30, he had not conquered the world like Alexander; and who, with the haughty temper of a despot, was more desirous to be the first man in a village than the second in Rome.

"Cæsar had the good fortune to exist in times of trouble and civil commotions, when the minds of men are put into a ferment; when opportunities of great actions are frequent; when talents are every thing, and those who can only boast of their virtues are nothing. If he had lived an hundred years sooner, he would have been no more than an obscure villain; and, instead of giving laws to the world, would not have been able to produce any confusion in it.

"I will here be bold enough to advance an idea, which may appear paradoxical to those who weakly judge of men from what they achieve, and not from the principle which leads them to act. Nature formed in the same mould Cæsar, Mahomet, Cromwell, and Kouli Khan. They all of them united to genius that profound policy which renders it so powerful. They all of them had an evident superiority over those with whom they were surrounded; they were conscious of this superiority, and they made others conscious of it. They were all of them born subjects, and became fortunate usurpers. Had Cæsar been placed in Persia, he would have made the conquest of India; in Arabia, he would have been the founder of a new religion; in London, he would have stabbed his sovereign, or have procured his assassination under the sanction of the laws. He reigned with glory over men whom he had reduced to be slaves; and, under one aspect, he is to be considered as a hero; under another, as a monster. But it would be unfortunate, indeed, for society, if the possession of superior talents gave individuals a right to trouble its repose. Usurpers accordingly have flatterers, but no friends; strangers respect them; their subjects complain and submit; it is in their own families that humanity finds her avengers. Cæsar was assassinated by his son, Mahomet was poisoned by his wife, Kouli Khan was massacred by his nephew, and Cromwell only died in his bed because his son Richard was a philosopher.

"Cæsar, the tyrant of his country; Cæsar, who destroyed the agents of his crimes, if they failed in address; Cæsar, in fine, the husband of every wife, and the wife of every husband; has been accounted a great man by the mob of writers. But it is only the philosopher who knows how to mark the barrier between celebrity and greatness. The talents of this singular man, and the good fortune which constantly attended him till the moment of his assassination, have concealed the enormity of his actions."

CÆSAR, in Roman antiquity, a title borne by all the

Cæsar.

Cæsar
||
Cæsarian.

the emperors, from Julius Cæsar to the destruction of the empire. It was also used as a title of distinction for the intended or presumptive heir of the empire, as *king of the Romans* is now used for that of the German empire.

This title took its rise from the surname of the first emperor, C. Julius Cæsar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation of *Augustus* being appropriated to the emperors, in compliment to that prince, the title *Cæsar* was given to the second person in the empire, though still it continued to be given to the first; and hence the difference betwixt Cæsar used simply, and Cæsar with the addition of *Imperator Augustus*.

The dignity of Cæsar remained to the second of the empire, till Alexius Comnenus having elected Nicephorus Melissenus Cæsar, by contract; and it being necessary to confer some higher dignity on his own brother Isaacus, he created him Sebastocrator, with the precedence over Melissenus; ordering, that in all acclamations, &c. Isaacus Sebastocrator should be named the second, and Melissenus Cæsar the third.

CÆSAR (Sir Julius), a learned civilian, was descended by the female line from the duke de Cesarini in Italy; and was born near Tottenham in Middlesex, in the year 1557. He was educated at Oxford, and afterwards studied in the university of Paris, where, in the year 1581, he was created doctor of the civil law, and two years after was admitted to the same degree at Oxford, and also became doctor of the canon law. He was advanced to many honourable employments, and for the last 20 years of his life was master of the rolls. He was remarkable for his extensive bounty and charity to all persons of worth, so that he seemed to be the almoner-general of the nation. He died 1639, in the 79th year of his age. It is very remarkable that the manuscripts of this lawyer were offered (by the executors of some of his descendants) to a cheesemonger for waste-paper; but being timely inspected by Mr Samuel Paterfon, this gentleman discovered their worth, and had the satisfaction to find his judgment confirmed by the profession, to whom they were sold in lots for upwards of 500*l.* in the year 1757.

CÆSAR *Augusta* or *Cæsarea Augusta*, (anc. geog.), a Roman colony situated on the river Iberus in the hither Spain, before called *Salduba*, in the territories of the Edetani. Now commonly thought to be Saragosa.

CÆSAREA, the name of several ancient cities, particularly one on the coast of Phenice. It was very conveniently situated for trade; but had a very dangerous harbour, so that no ships could be safe in it when the wind was at south-west. Herod the Great king of Judea remedied this inconveniency at an immense expence and labour, making it one of the most convenient havens on that coast. He also beautified it with many buildings, and bestowed 12 years in the finishing and adorning it.

CÆSARIAN operation. See MIDWIFERY.

CÆSARIANS, *Cæsarienses*, in Roman antiquity, were officers or ministers of the Roman emperors: They kept the account of the revenues of the emperors; and took possession, in their name, of such things as devolved or were confiscated to them.

CÆSARODUNUM (anc. geog.), a town of the Turones in Celtic Gaul; now *Tours*, the capital of Touraine. See TOURS.

CÆSAROMAGUS (anc. geog.), a town of the Trinobantes in Britain; by some supposed to be *Chelmsford*, by others *Brentford*, and by others *Burset*.

CÆSENA (anc. geog.), a town of Gallia Cispadana, situated on the rivers Isapis and Rubicon; now CÆSENA, which see.

CÆSIA SYLVA (anc. geog.), a wood in Germany, part of the great Sylva Hercynia, situated partly in the duchy of Cleves, and partly in Westphalia between Wesel and Kesfield.

CÆSONES, a denomination given to those cut out of their mother's wombs. Pliny ranks this as an auspicious kind of birth; the elder Scipio Africanus, and the first family of Cæsars, were brought into the world in this way.

CÆSTUS, in antiquity, a large gantlet made of raw hide, which the wrestlers made use of when they fought at the public games.—This was a kind of leathern strap, strengthened with lead or plates of iron, which encompassed the hand, the wrist, and a part of the arm, as well to defend these parts as to enforce their blows.

CÆSTUS, or *Cæstum*, was also a kind of girdle, made of wool, which the husband untied for his spouse the first day of marriage, before they went to bed.

This relates to Venus's girdle, which Juno borrowed of her to entice Jupiter to love her. See CESTUS.

CÆSURA, in the ancient poetry, is when, in the scanning of a verse, a word is divided so, as one part seems cut off, and goes to a different foot from the rest; as,

Menti|ri no|li, nun|quam men|dacia |profunt.

where the syllables *ri*, *li*, *quam*, and *men*, are cæsuras.

CÆSURE, in the modern poetry, denotes a rest or pause towards the middle of an Alexandrian verse, by which the voice and pronunciation are aided, and the verse, as it were, divided into two hemistichs. See PAUSE.

CÆTERIS PARIBUS, a Latin term in frequent use among mathematical and physical writers. The words literally signify, *the rest (or other things) being alike or equal*. Thus we say the heavier the bullet, *cæteris paribus*, the greater the range; *i. e.* by how much the bullet is heavier, if the length and diameter of the piece and strength of the powder be the same, by so much will the utmost range or distance of a piece of ordnance be the greater. Thus also, in a physical way, we say, the velocity and quantity circulating in a given time through any section of an artery, will, *cæteris paribus*, be according to its diameter, and nearness to or distance from the heart.

CÆTOBRIX (anc. geog.), a town of Lusitania, near the mouth of the Tagus on the east side; now extinct. It had its name from its fishery; and there are still extant fish-ponds on the shore, done with plaster of Paris, which illustrate the name of the ruined city.

CAFFA, in commerce, painted cotton-cloths manufactured in the East Indies, and sold at Bengal.

CAFFA, or *Kaffa*, a city and port-town of Crim Tartary, situated on the south-east part of that peninsula. E. Long. 37. 0. N. Lat. 44. 55.

Cæsarodu-
num
||
Caffa.

Caffila
||
Cage.

It is the most considerable town in the country, and gives name to the straits of Caffa, which runs from the Euxine or Black Sea, to the Palus Meotis, or sea of Azoph.

CAFFILA, a company of merchants or travellers, who join together in order to go with more security through the dominions of the Grand Mogul, and through other countries on the continent of the East Indies.

The Caffila differs from a caravan, at least in Persia: for the caffila belongs properly to some sovereign, or to some powerful company in Europe, whereas a caravan is a company of particular merchants, each trading upon his own account. The English and Dutch have each of them their caffila at Gambrow. There are also such caffilas, which cross some parts of the deserts of Africa, particularly that called the *sea of sand*, which lies between the kingdom of Morocco and those of Tombut and Gaigo. This is a journey of 400 leagues; and takes up two months in going, and as many in coming back; the caffila travelling only by night, on account of the excessive heat of that country. The chief merchandize they bring back consists in gold dust, which they call *atibar*, and the Europeans *tibir*.

CAFFILA on the coast of Guzerat or Cambaya, signifies a small fleet of merchant-ships.

CAFFRARIA, the country of the Caffres or Hottentots, in the most southerly parts of Africa lying in the form of a crescent about the inland country of Monomopata, between 35° south latitude and the tropic of Capricorn: and bounded on the east, south, and west, by the Indian and Atlantic oceans. See HOTTENTOTS.

Most of the sea-coasts of this country are subject to the Dutch, who have built a fort near the most southern promontory, called the *Cape of Good-Hope*.

CAG, or KEG, a barrel or vessel, that contains from four to five gallons.

CAGANUS, or CACANUS, an appellation anciently given by the Huns to their kings. The word appears also to have been formerly applied to the princes of Muscovy, now called *czar*. From the same also, probably, the Tartar title *cham* or *can*, had its origin.

CAGE, an inclosure made of wire, wicker, or the like, interwoven lattice-wise, for the confinement of birds or wild beasts. The word is French, *cage*, formed from the Italian *gaggia*, of the Latin *cavea*, which signifies the same: *a caveis theatralibus in quibus includebantur ferae*.

Beasts were usually brought to Rome shut up in oaken or beechen cages, artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. The fiercer sort were pent in iron cages, lest wooden prisons should be broke through. In some prisons there are iron cages for the closer confinement of criminals. The French laws distinguish two sorts of bird-cages, viz. high or singing cages, and low or dumb-cages; those who expose birds to sale are obliged to put the hens in the latter, and the cocks in the former, that persons may not be imposed on by buying a hen for a cock.

CAGES (*cavea*), denote also places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. The *cavea* were a sort of iron

cages different from dens, which were under ground and dark; whereas the *cavea* being airy and light, the beasts rushed out of them with more alacrity and fierceness than if they had been pent under ground.

CAGE, in carpentry, signifies an outer-work of timber, enclosing another within it. In this sense we say, *the cage of a wind-mill*. The cage of a stair-case denotes the wooden sides or walls which inclose it.

CAGEAN, or CAGAYAN, a province of the island of Lytzen, or Manila, in the East Indies. It is the largest in the island, being 80 leagues in length, and 40 in breadth. The principal city is called *New Segovia*, and 15 leagues eastward from this city lies cape Bajador. Doubling that cape, and coasting along 20 leagues from north to south, the province of Cagean ends, and that of Illocos begins. The peaceable Cageans who pay tribute are about 9000; but there are a great many not subdued. The whole province is fruitful: the men apply themselves to agriculture, and are of a martial disposition; and the women apply to several works in cotton. The mountains afford food for a vast number of bees; in consequence of which wax is so plenty, that all the poor burn it instead of oil. They make their candles after the following manner: they leave a small hole at each end of a hollow stick for the wick to run through; and then, stopping the bottom, fill it with wax at the top: when cold, they break the mould, and take out the candle. On the mountains there is abundance of brasil, ebony, and other valuable woods. In the woods are store of wild beasts, as boars; but not so good as those of Europe. There are also abundance of deer, which they kill for their skins and horns to sell to the Chinese.

CAGLI, an ancient episcopal town of Italy, in the duchy of Urbino, situated at the foot of the Apennine mountains. E. Long. 14. 12. N. Lat. 43. 30.

CAGLIARI (Paolo), called *Paulo Veronese*, an excellent painter, was born at Verona in the year 1532. Gabriel Cagliari his father was a sculptor, and Antonio Badile his uncle was his master in painting. He was not only esteemed the best of all the Lombard painters, but for his extensive talents in the art was peculiarly styled *Il pittor felice*, "the happy painter;" and there is scarcely a church in Venice where some of his performances are not to be seen. De Piles says, that "his picture of the marriage at Cana, in the church of St George, is to be distinguished from his other works, as being not only the triumph of Paul Veronese, but almost the triumph of painting itself." When the senate sent Grimani, procurator of St Mark, to be their ambassador at Rome, Paul attended him, but did not stay long, having left some pieces at Venice unfinished. Philip II. king of Spain, sent for him to paint the Escorial, and made him great offers; but Paul excused himself from leaving his own country, where his reputation was so well established, that most of the princes of Europe ordered their several ambassadors to procure something of his hand at any rate. He was indeed highly esteemed by all the principal men in his time; and so much admired by the great masters, as well his contemporaries as those who succeeded him, that Titian himself used to say, he was the ornament of his profession. And Guido Reni being asked which of the masters his predecessors he would choose to be, were it in his power, after Raphael and Corregio,

gio, named Paul Veronese; whom he always called his Paolino. He died of a fever at Venice in 1588, and had a tomb and a statue of brass erected to his memory in the church of St Sebastian. He left great wealth to his two sons Gabriel and Charles, who lived happily together, and joined in finishing several of their father's imperfect pieces with good success.

CAGLIARI, an ancient, large, and rich town, capital of the island of Sardinia in the Mediterranean. It is seated on the declivity of an hill, is an university, an archbishopric, and the residence of the viceroy. It has an excellent harbour, and a good trade; but is a place of no great strength. It was taken, with the whole island, by the English in 1708, who transferred it to the emperor Charles VI.; but it was retaken by the Spaniards in 1717, and about two years afterwards ceded to the duke of Savoy in lieu of Sicily, and hence he has the title of *king of Sardinia*. E. Long. 9. 14. N. Lat. 39. 12.

CAGUI, in zoology, a synonyme of two species of monkeys, viz. the jacchus and oedipus. See SIMIA.

CAHORS, a considerable town of France, in Querci in Guienne, with a bishop's see and an university. It is seated on a peninsula made by the river Lot, and built partly on a craggy rock. The principal street is very narrow; and terminates in the market-place, in which is the town-house. The cathedral is a Gothic structure, and has a large square steeple. The fortifications are regular, and the town is surrounded with thick walls. E. Long. 1. 6. N. Lat. 44. 26.

CAHYS, a dry measure for corn, used in some parts of Spain, particularly at Seville and at Cadiz. It is near a bushel of our measure.

CAJANABURG, the capital of the province of Cajania or East Bothnia in Sweden, situated on the north-east part of the lake Cajania, in E. Long. 27. 0. N. Lat. 63. 50.

CAIPHAS, high-priest of the Jews after Simon, condemned Christ to death; and was put out of his place by the emperor Vitellius, for which disgrace he made away with himself.

CAJAZZO, a town of the province of Lavoro in the kingdom of Naples, situated in E. Long. 15. 0. N. Lat. 41. 15.

CAICOS, the name of some American islands to the north of St Domingo, lying from W. Long. 112. 10. to 113. 16. N. Lat. 21. 40.

CAJEPUT, an oil brought from the East Indies resembling that of Cardamoms.

CAIETA, (anc. geog.), a port and town of Latium, so called from Æneas's nurse; now *Gaeta*, which see.

CAJETAN (Cardinal), was born at Cajeta in the kingdom of Naples in the year 1469. His proper name was *Thomas de Vio*; but he adopted that of *Cajetan* from the place of his nativity. He defended the authority of the Pope, which suffered greatly at the council of Nice, in a work entitled *Of the power of the Pope*; and for this work he obtained the bishopric of Cajeta. He was afterwards raised to the archiepiscopal see of Palermo, and in 1517 was made a cardinal by Pope Leo X. The year after, he was sent as legate into Germany, to quiet the commotions raised against indulgences by Martin Luther; but Luther, under protection of Frederic elector of Saxony, set him at defiance; for though he obeyed the cardinal's summons

in repairing to Augsburg, yet he rendered all his proceedings ineffectual. Cajetan was employed in several other negotiations and transactions, being as ready at business as at letters. He died in 1534. He wrote Commentaries upon Aristotle's philosophy, and upon Thomas Aquinas's theology; and made a literal translation of the Old and New Testaments.

CAIFONG, a large, populous, and rich town of Asia, in China, seated in the middle of a large and well cultivated plain. It stands in a bottom; and when besieged by the rebels in 1642, they ordered the dykes of the river Hohangho to be cut, which drowned the city, and destroyed 300,000 of its inhabitants. E. Long. 113. 27. N. Lat. 35. 0.

CAILLE (Nicholas Louis de la), an eminent mathematician and astronomer, was born at a small town in the diocese of Rheims in 1713. His father had served in the army, which he quitted, and in his retirement studied mathematics; and amused himself with mechanic exercises, wherein he proved the happy author of several inventions of considerable use to the public. Nicholas, almost in his infancy, took a fancy to mechanics, which proved of signal service to him in his maturer years. He was sent young to school at Mantes-sur-Seine, where he discovered early tokens of genius. In 1729, he went to Paris; where he studied the classics, philosophy, and mathematics. Afterwards he went to study divinity at the college de Navarre, proposing to embrace an ecclesiastical life. At the end of three years he was ordained a deacon, and officiated as such in the church of the college de Mazarin several years; but he never entered into priests orders, apprehending that his astronomical studies, to which he became most assiduously devoted, might too much interfere with his religious duties. In 1739, he was conjoined with M. de Thury, son to M. Cassini, in verifying the meridian of the royal observatory through the whole extent of the kingdom of France. In the month of November the same year, whilst he was engaged day and night in the operations which this grand undertaking required, and at a great distance from Paris, he was, without any solicitation, elected into the vacant mathematical chair which the celebrated M. Varignon had so worthily filled. Here he began to teach about the end of 1740; and an observatory was ordered to be erected for his use in the college, and furnished with a suitable apparatus of the best instruments. In May 1741, M. de la Caille was admitted into the royal academy of sciences as an adjoint member for astronomy. Besides the many excellent papers of his dispersed up and down in their memoirs, he published Elements of geometry, mechanics, optics, and astronomy. Moreover, he carefully computed all the eclipses of the sun and moon that had happened since the Christian æra, which were printed in a book published by two Benedictines, entitled *L'Art de verifier les dates*, &c. Paris, 1750, in 4to. Besides these, he compiled a volume of astronomical ephemerides for the years 1745 to 1755; another for the years 1755 to 1765; a third for the years 1765 to 1775; an excellent work entitled *Astronomie fundamenta novissimis solis et stellarum observationibus stabilita*; and the most correct solar tables that ever appeared. Having gone through a seven years series of astronomical observations in his own observatory, he formed a project of going to observe the southern stars at the

Caifong,
Caille.

Caille.

Cape of Good Hope. This was highly approved by the academy, and by the prime minister Comte de Argenson, and very readily agreed to by the states of Holland. Upon this, he drew up a plan of the method he proposed to pursue in his southern observations; setting forth, that, besides settling the places of the fixed stars, he proposed to determine the parallax of the moon, Mars, and Venus. But whereas this required correspondent observations to be made in the northern parts of the world, he sent to those of his correspondents who were expert in practical astronomy previous notice, in print, what observations he designed to make at such and such times for the said purpose. At length, on the 21st of November 1750, he sailed for the Cape, and arrived there on the 19th of April 1751. He forthwith got his instruments on shore; and, with the assistance of some Dutch artificers, set about building an astronomical observatory, in which his apparatus of instruments was properly disposed of as soon as it was in a fit condition to receive them.

The sky at the Cape is generally pure and serene, unless when a south-east wind blows. But this is often the case; and when it is, it is attended with some strange and terrible effects. The stars look bigger, and seem to caper; the moon has an undulating tremor; and the planets have a sort of beard like comets. Two hundred and twenty-eight nights did our astronomer survey the face of the southern heavens; during which space, which is almost incredible, he observed more than 10,000 stars; and whereas the ancients filled the heavens with monsters and old-wives tales, the abbe de la Caille chose rather to adorn them with the instruments and machines which modern philosophy has

* See the made use of for the conquest of nature*. With no Planisphere less success did he attend to the parallax of the moon, in his *Caelum australe stelliferum*. Mars, Venus, and the sun. Having thus executed the purpose of his voyage, and no present opportunity offering for his return, he thought of employing the vacant time in another arduous attempt; no less than that of taking the measure of the earth, as he had already done that of the heavens. This indeed had, through the munificence of the French king, been done before by different sets of learned men both in Europe and America; some determining the quantity of a degree under the equator, and others under the arctic circle: but it had not as yet been decided whether in the southern parallels of latitude the same dimensions obtained as in the northern. His labours were rewarded with the satisfaction he wished for; having determined a distance of 410,814 feet from a place called *Klip-Fontyn* to the Cape, by means of a base of 38,802 feet, three times actually measured: whence he discovered a new secret of nature, namely, that the radii of the parallels in south latitude are not the same as those of the corresponding parallels in north latitude. About the 23d degree of south latitude he found a degree on the meridian to contain 342,222 Paris feet. He returned to Paris the 27th of September 1754; having in his almost four years absence expended no more than 9144 livres on himself and his companion; and at his coming into port, he refused a bribe of 100,000 livres, offered by one who thirsted less after glory than gain, to be sharer in his immunity from custom-house searches.

After receiving the congratulatory visits of his more

intimate friends and the astronomers, he first of all thought fit to draw up a reply to some strictures which professor Euler had published relative to the meridian, and then he settled the results of the comparison of his own with the observations of other astronomers for the parallaxes. That of the sun he fixed at $9\frac{1}{2}''$; of the moon, at $56' 56''$; of Mars in his opposition, $36''$; of Venus, $38''$. He also settled the laws whereby astronomical refractions are varied by the different density or rarity of the air, by heat or cold, and dryness or moisture. And, lastly, he showed an easy, and by common navigators practicable, method of finding the longitude at sea by means of the moon, which he illustrated by examples selected from his own observations during his voyages. His fame being now established upon so firm a basis, the most celebrated academies of Europe claimed him as their own: and he was unanimously elected a member of the royal society at London; of the institute of Bologna; of the imperial academy at Petersburg; and of the royal academies of Berlin, Stockholm, and Gottingen. In the year 1760, Mr de la Caille was attacked with a severe fit of the gout; which, however, did not interrupt the course of his studies; for he then planned out a new and immense work, no less than a history of astronomy through all ages, with a comparison of the ancient and modern observations, and the construction and use of the instruments employed in making them. In order to pursue the task he had imposed upon himself in a suitable retirement, he obtained a grant of apartments in the royal palace of Vincennes; and whilst his astronomical apparatus was erecting there, he began printing his Catalogue of the southern stars, and the third volume of his Ephemerides. The state of his health was, towards the end of the year 1763, greatly reduced. His blood grew inflamed; he had pains of the head, obstructions of the kidneys, loss of appetite, with an op-pletion of the whole habit. His mind remained unaffected, and he resolutely persisted in his studies as usual. In the month of March, medicines were administered to him, which rather aggravated than alleviated his symptoms; and he was now sensible, that the same distemper which in Africa, ten years before, yielded to a few simple remedies, did in his native country bid defiance to the best physicians. This induced him to settle his affairs: his manuscripts he committed to the care and discretion of his esteemed friend M. Maraldi. It was at last determined that a vein should be opened; but this brought on an obstinate lethargy, of which he died, aged 49.

CAIMACAN, or CAIMACAM, in the Turkish affairs, a dignity in the Ottoman empire, answering to lieutenant, or rather deputy, amongst us.

There are usually two Caimacans; one residing at Constantinople, as governor thereof; the other attending the grand vizir in quality of his lieutenant, secretary of state, and first minister of his council, and gives audience to ambassadors. Sometimes there is a third caimacan, who attends the sultan; whom he acquaints with any public disturbances, and receives his orders concerning them.

CAIMAN ISLANDS, certain American islands lying south of Cuba, and north-west of Jamaica, between 81° and 86° of west longitude, and in 21 of north latitude. They are most remarkable on account of the fishery

Caille
||
Caiman
Islands.

Cain
||
Cairns.

fishery of tortoise, which the people of Jamaica catch here, and carry home alive, keeping them in pens for food, and killing them as they want them.

CAIN, eldest son of Adam and Eve, killed his brother Abel; for which he was condemned by God to banishment and a vagabond state of life. Cain retired to the land of Nod, on the east of Eden; and built a city, to which he gave the name of his son Enoch.

CAINITES, a sect of heretics in the 2d century, so called on account of their great respect for Cain. They pretended that the virtue which produced Abel was of an order inferior to that which had produced Cain, and that this was the reason why Cain had the victory over Abel and killed him; for they admitted a great number of genii, which they called *virtues*, of different ranks and orders. They made profession of honouring those who carry in Scripture the most visible marks of reprobation; as the inhabitants of Sodom, Esau, Korah, Dathan, and Abiram. They had, in particular, a very great veneration for the traitor Judas, under pretence that the death of Jesus Christ had saved mankind. They had a forged gospel of Judas, to which they paid great respect.

CAIRNS, or CARNES, the vulgar name of those heaps of stones which are to be seen in many places of Britain, particularly Scotland and Wales.—They are composed of stones of all dimensions thrown together in a conical form, a flat stone crowning the apex; (see Plate CXXVII.).

Various causes have been assigned by the learned for these heaps of stones. They have supposed them to have been, in times of inauguration, the places where the chieftain-elect stood to show himself to best advantage to the people; or the place from whence judgment was pronounced; or to have been erected on the road-side in honour of Mercury; or to have been formed in memory of some solemn compact, particularly where accompanied by standing pillars of stones; or for the celebration of certain religious ceremonies. Such might have been the reasons, in some instances, where the evidences of stone-chests and urns are wanting: but these are so generally found, that they seem to determine the most usual purpose of the piles in question to have been for sepulchral monuments. Even this destination might render them suitable to other purposes; particularly religious, to which by their nature they might be supposed to give additional solemnity.—According to Toland, fires were kindled on the tops or flat stones, at certain times of the year, particularly on the eves of the 1st of May and the 1st of November, for the purpose of sacrificing; at which time all the people having extinguished their domestic hearths rekindled them from the sacred fires of the cairns. In general, therefore, these accumulations appear to have been designed for the sepulchral protection of heroes and great men. The stone-chests, the repository of the urns and ashes, are lodged in the earth beneath: sometimes only one, sometimes more, are found thus deposited; and Mr Pennant mentions an instance of 17 being discovered under the same pile.

Cairns are of different sizes, some of them very large. Mr Pennant describes one in the island of Arran, 114 feet over and of a vast height. They may justly be supposed to have been proportioned in size to the rank

of the person, or to his popularity: the people of a whole district assembled to show their respect to the deceased; and, by an active honouring of his memory, soon accumulated heaps equal to those that astonish us at this time. But these honours were not merely those of the day; as long as the memory of the deceased endured, not a passenger went by without adding a stone to the heap: they supposed it would be an honour to the dead, and acceptable to his manes.

*Quamquam festinas, non est mora longa: licebit,
Injeto ter pulvere, curras.*

To this moment there is a proverbial expression among the highlanders allusive to the old practice: a suppliant will tell his patron, *Curri mi cloch er do charne*, "I will add a stone to your cairn;" meaning, When you are no more, I will do all possible honour to your memory.

Cairns are to be found in all parts of our islands, in Cornwall, Wales, and all parts of North Britain; they were in use among the northern nations; Dahlberg, in his 323d plate, has given the figure of one. In Wales they are called *carneddau*; but the proverb taken from them there, is not of the complimentary kind: *Karn ar dy ben*, or, "A cairn on your head," is a token of imprecation.

CAIRO, or GRAND CAIRO, the capital of Egypt, situated in a plain at the foot of a mountain, in E. Long. 32. 0. N. Lat. 30. 0. It was founded by Jawhar, a Magrebian general, in the year of the Hegira 358. He had laid the foundations of it under the horoscope of Mars; and for that reason gave his new city the name of *Al Kabirah*, or the *Victorious*, an epithet applied by the Arab astronomers to that planet. In 362 it became the residence of the kaliffs of Egypt, and of consequence the capital of that country, and has ever since continued to be so. It is divided into the New and Old cities. Old Cairo is on the eastern side of the river Nile, and is now almost uninhabited. The New, which is properly Cairo, is seated in a sandy plain about two miles and a half from the old city. It stands on the western side of the Nile, from which it is not three quarters of a mile distant. It is extended along the mountain on which the castle is built, for the sake of which it was removed hither, in order, as some pretend, to be under its protection. However, the change is much for the worse, as well with regard to air as water, and the pleasantness of the prospect. Bulack may be called the port of Cairo; for it stands on the bank of the Nile, about a mile and a half from it, and all the corn and other commodities are landed there before they are brought to the city. Some travellers have made Cairo of a most enormous magnitude, by taking in the old city Bulack, and the new; the real circumference of it, however, is not above ten miles, but it is extremely populous. The first thing that strikes a traveller is the narrowness of the streets, and the appearance of the houses. These are so daubed with mud on the outside, that you would think they were built with nothing else. Besides, as the streets are unpaved, and always full of people, the walking in them is very inconvenient, especially to strangers. To remedy this, there are a great number of asses, which always stand ready to be hired for a trifle, that is, a penny a mile. The owners drive them

Cairo.

Cairo.

them along, and give notice to the crowd to make way. And here it may be observed, that the Christians in this, as well as other parts of the Turkish dominions, are not permitted to ride upon horses. The number of the inhabitants can only be guessed at; but we may conclude it to be very great, because in some years the plague will carry off 200,000, without their being much missed. The houses are from one to two or three stories high, and flat at the top; where they take the air, and often sleep all night. The better sort of these have a court on the inside like a college. The common run of houses have very little room, and even among great people it is usual for 20 or 30 to lie in the small hall. Some houses will hold 300 persons of both sexes, among whom are 20 or 30 slaves, and those of ordinary rank have generally three or four.

There is a canal called *Halis*, which runs along the city from one end to the other, with houses on each side, which make a large straight street. Besides this, there are several lakes, which are called *birks* in the language of the country. The principal of these, which is near the castle, is 500 paces in diameter. The most elegant houses in the city are built on its banks; but what is extraordinary, eight months in the year it contains water, and the other four it appears with a charming verdure. When there is water sufficient, it is always full of gilded boats, barges, and barks, in which people of condition take their pleasure towards night, at which time there are curious fire-works, and variety of music.

New Cairo is surrounded with walls built with stone, on which are handsome battlements, and at the distance of every hundred paces there are very fine towers, which have room for a great number of people. The walls were never very high, and are in many places gone to ruin. The basha lives in the castle, which was built by Saladine seven hundred years ago. It stands in the middle of the famous mountain Moketan, which terminates in this place, after it had accompanied the Nile from Ethiopia hither. This castle is the only place of defence in Egypt; and yet the Turks take no notice of its falling, insomuch that in process of time it will become a heap of rubbish. The principal part in it is a magnificent hall, environed with 12 columns of granite, of a prodigious height and thickness, which sustain an open dome, under which Saladine distributed justice to his subjects. Round this dome there is an inscription in relievo, which determines the date and by whom it was built. From this place the whole city of Cairo may be seen, and above 30 miles along the Nile, with the fruitful plains that lie near it, as well as the mosques, pyramids, villages, and gardens, with which these fields are covered. These granite pillars were the work of antiquity, for they were got out of the ruins of Alexandria. There are likewise in the mosques and in the principal houses no less than 40,000 more, besides great magazines, where all kinds are to be had at very low rates. A janissary happened to find five in his garden, as large as those in the castle; but could not find any machine of strength sufficient to move them, and therefore had them sawed in pieces to make mill-stones. It is believed that there have been 30 or 40,000 of these pillars brought from Alexandria, where there are yet many more to be had.

The gates of Cairo are three, which are very fine and magnificent.

There are about 300 public mosques in this city, some of which have six minarets. The mosque of Ashar hath several buildings adjoining, which were once a famous university, and 14,000 scholars and students were maintained on the foundation; but has now not above 1400, and those are only taught to read and write. All the mosques are built upon the same plan, and differ only in magnitude. The entrance is thro' the principal gate into a large square, open on the top, but well paved. Round this are covered galleries, supported by pillars; under which they say their prayers, in the shade. On one side of the square there are particular places with basins of water, for the convenience of performing the ablutions enjoined by the Koran. The most remarkable part of the mosque, besides the minaret, is the dome. This is often bold, well proportioned, and of an astonishing magnitude. The inside stones are carved like lace, flowers, and melons. They are built so firm, and with such art, that they will last 600 or 700 years. About the outward circumference there are large Arabic inscriptions, in relievo, which may be read by those who stand below, though they are sometimes of a wonderful height.

The khanes or caravanseras are numerous and large, with a court in the middle, like their houses. Some are several stories high, and are always full of people and merchandise. The Nubians, the Abyssinians, and other African nations, which come to Cairo, have one to themselves, where they always meet with lodging. Here they are secure from insults, and their effects are all safe. Besides these, there is a bazar, or market, where all sorts of goods are to be sold. This is in a long broad street; and yet the crowd is so great, you can hardly pass along. At the end of this street is another short one, but pretty broad, with shops full of the best sort of goods, and precious merchandise. At the end of this short street there is a great khane, where all sorts of white slaves are to be sold. Farther than this is another khane, where a great number of blacks, of both sexes, are exposed to sale. Not far from the best market-place is an hospital, and a mosque for mad people. They also receive and maintain sick people into this hospital, but they are poorly looked after.

Old Cairo has scarce any thing remarkable but the granaries of Joseph; which are nothing but a high wall, lately built, which includes a square spot of ground, where they deposite wheat, barley, and other grain, which is a tribute to the basha, paid by the owners of land. This has no other covering but the heavens, and therefore the birds are always sure to have their share. There is likewise a tolerable handsome church, which is made use of by the Copts, who are Christians and the original inhabitants of Egypt. Joseph's well is in the castle, and was made by king Mohammed about 700 years ago. It is called *Joseph's well*, because they attribute every thing extraordinary to that remarkable person. It is cut in a rock, and is 280 feet in depth. The water is drawn up to the top by means of oxen, placed on platforms, at proper distances, which turn about the machines that raise it. The descent is so sloping, that, though there are no steps, the oxen can descend and ascend with ease.

The

Cairo.

Cairo
||
Caithness.

The river Nile, to which not only Cairo, but all Egypt is so much indebted, is now known to have its rise in Abyssinia. The increase of the Nile generally begins in May, and in June they commonly proclaim about the city how much it is risen. Over against old Cairo the basha has a house, wherein the water enters to a column, which has lines at the distance of every inch, and marks at every two feet as far as 30. When the water rises to 22 feet, it is thought to be of a sufficient height; when it rises much higher, it does a great deal of mischief. There is much pomp and ceremony used in letting the water into the canal, or hali, above-mentioned. The basha gives the first stroke towards the removal of the dike or dam. When the water has filled the canal and lakes in the city, and the numerous cisterns that are in the mosques and private houses, it is let into a vast plain, to the north-east; the extent of which is 50 miles. When the country is covered with water, it is no unpleasant sight to view the towns appearing like little islands, and the people passing and repassing in boats.

The inhabitants of Cairo are a mixture of Moors, Turks, Jews, Greeks, and Coptis, or Coptis. The only difference between the habit of the Moors and Coptis is their turbans; those of the Moors being white, and of the Coptis white striped with blue. The common people generally wear a long black loose frock, sewed together all down before. The Jews wear a frock of the same fashion, made of cloth; and their caps are like a high crowned hat, without brims, covered with the same cloth, but not so taper. The Jewish womens are not very unlike the mens, but more light and long. The Greeks are habited like the Turks, only their turbans differ.

Provisions of all kinds are exceeding plenty; for 20 eggs may be bought for a parrah or penny, and bread is six times as cheap as with us. They have almost all sorts of flesh and fish; and in particular have tame buffaloes, which are very useful. They bring goats into the streets in great numbers, to sell their milk. Their gardens are well stocked with fruit-trees of various kinds, as well as roots, herbs, melons, and cucumbers. The most common flesh meat is mutton. The goats are very beautiful, and have ears two feet in length; but their flesh is in no great esteem.

CAIROAN, or CAIRWAN, a city of Africa, in the kingdom of Tunis, seated in a sandy barren soil, about five miles from the gulph of Capres. It has neither spring, well, nor river; for which reason they are obliged to preserve rain-water in tanks and cisterns. It was built by the Aglabites; and is the ancient Cyrene*, but hath now lost its splendor. There is still, however, a very superb mosque, and the tombs of the kings of Tunis are yet to be seen. E. Long. 9. 12. N. Lat. 35. 40.

CAISSON, in the military art, a wooden chest, into which several bombs are put, and sometimes filled only with gunpowder: this is buried under some work whereof the enemy intend to possess themselves, and, when they are masters of it, is fired, in order to blow them up.

CAISSON is also used for a wooden frame or chest used in laying the foundations of the piers of a bridge.

CAITHNESS, otherwise called the *shire of Wick*, is the most northern county of all Scotland; bounded

on the east by the ocean, and by Strathnaver and Sutherland on the south and south-west: from these it is divided by the mountains Orde, and a continued ridge of hills as far as Knockfin, then by the whole course of the river Hallowdale. On the north it is washed by the Pentland or Putland frith, which flows between this county and the Orkneys. It extends 35 miles from north to south, and about 20 from east to west. The coast is rocky, and remarkable for a number of bays and promontories. Of these, the principal are Sand-side-head to the west, pointing to the opening of Pentland frith; Orcas, now Holborn-head, and Dunnet-head, both pointing northward to the frith. Dunnet-head, is a peninsula about a mile broad, and seven in compass; affording several lakes, good pasture, excellent mill-stones, and a lead-mine. Scribister bay, on the north-west, is a good harbour, where ships may ride securely. Rice-bay, on the east side, extends three miles in breadth; but is of dangerous access, on account of some sunk rocks at the entrance. At the bottom of this bay appear the ruins of two strong castles, the seat of the Earl of Caithness, called *Castle Sinclair*, and Gernego, joined to each other by a draw-bridge. Duncan's bay, otherwise called *Dunby-head*, is the north-east point of Caithness, and the extremest promontory in Britain. At this place, the breadth of the frith does not exceed 12 miles, and in the neighbourhood is the ordinary ferry to the Orkneys. Here is likewise Clytheness pointing east, and Noshead pointing north-east. The sea in this place is very impetuous, being in continual agitation from violent counter-tides, currents, and vortices. The only island belonging to this county is that of Stroma, in the Pentland frith, at the distance of two miles from the main land, extending about a mile in length, and producing good corn. The navigation is here rendered very difficult by conflicting tides and currents, which at both ends of the island produce a great agitation in the sea. At the south end, the waves dance so impetuously, that the sailors term them the *merry men of May*, alluding to the house of one Mr May, on the opposite shore of Caithness, which served them as a land-mark, in the dangerous passage between the island and the continent. The property of this island was once disputed between the earls of Orkney and Caithness; but adjudged to the latter, in consequence of an experiment, by which it appeared, that venomous creatures will live in Stroma, whereas they die immediately if transported to the Orkneys. The county of Caithness, though chiefly mountainous, flattens towards the sea-coast, where the ground is arable, and produces good harvests of oats and barley, sufficient for the natives, and yielding a surplus for exportation. Caithness is well watered with small rivers, brooks, lakes, and fountains, and affords a few woods of birch, but is in general bare of trees; and even those the inhabitants plant are stunted in their growth. Lead is found at Dunnet, copper at Old Urk, and iron ore at several places; but these advantages are not improved. The air of Caithness is temperate, tho' in the latitude of 58, where the longest day in summer is computed at 18 hours; and when the sun sets, he makes so small an arch of a circle below the horizon, that the people enjoy a twilight until he rises again. The fuel used by the inhabitants of Caithness consists of peat and turf, which the ground yields in great plenty. The

Caithness.

forests.

* See *Barbary*.

Caithness. forests of Moravins and Berridale afford abundance of red-deer and roe-bucks: the country is well stored with hares, rabbits, grouse, heathcocks, plover, and all sorts of game, comprehending a bird called *snow-fleet*, about the size of a sparrow, exceedingly fat and delicious, that comes hither in large flights about the middle of February, and takes its departure in April. The hills are covered with sheep and black cattle; so numerous, that a fat cow has been sold at market for 4s. Sterling. The rocks along the coasts are frequented by eagles, hawks, and all manner of sea-fowl, whose eggs and young are taken in vast quantities by the natives. The rivers and lakes abound with trout, salmon, and eels; and the sea affords a very advantageous fishery. Divers obelisks and ancient monuments appear in this district, and several Romish chapels are still standing. Caithness is well peopled with a race of hardy inhabitants, who employ themselves chiefly in fishing, and breeding sheep and black cattle: they are even remarkably industrious; for between Wick and Dunbeath, one continued track of rugged rocks, extending 12 miles, they have forced several little harbours for their fishing boats, and cut artificial steps from the beach to the top of the rocks, where they have erected houses, in which they cure and dry the fish for market.

According to Mr Pennant, this county is supposed to send out in some years about 20,000 head of black cattle, but in bad seasons the farmer kills and sells great numbers for sale. Great numbers of swine are also reared here. These are short, high-backed, long bristled, sharp, slender, and long-nosed; have long erect ears, and most savage looks. Here are neither barns nor granaries: the corn is threshed out, and preserved in the chaff in byks; which are stacks, in the shape of beehives, thatched quite round, where it will keep good for two years. Vast numbers of salmon are taken at Castle-hill, Dunnet, Wick, and Thurso. A miraculous draught at this last place is still talked of, not less than 2500 being taken at one tide within the memory of man; and Mr Smollet informs us, that, in the neighbourhood, above 300 good salmon have been taken at one draught of the net. In the month of November, great numbers of seals are taken in the caverns that open into the sea, and run some hundreds of yards under ground. The entrance of these caverns is narrow, but the inside lofty and spacious. The seal-hunters enter these in small boats with torches, which they light as soon as they land, and then with loud shouts alarm the animals, which they kill with clubs as they attempt to pass. This is a hazardous employment; for should the wind blow hard from sea, these adventurers are inevitably lost. Sometimes a large species of seals, 12 feet long, have been killed on this coast; and it is said the same kind are found on the rock Hiskir, one of the western islands. During the spring, great quantities of lump-fish resort to this coast, and are the prey of the seals, as appears from the number of skins of those fishes which at that season float ashore. At certain times also the seals seem to be visited by a great mortality; for, at those times, multitudes of them are seen dead in the water. Much limestone is found in this country, which when burnt is made into a compost with turf and sea-plants. The common people are kept in great servitude, and most of their time is given

to the lairds, an invincible impediment to the prosperity of the country. The women are also condemned to a shameful drudgery; it not being uncommon to see them trudging in droves of 60 or 70 to the fields with baskets of dung on their backs, which are filled at pleasure from the dunghills by their lords and masters with their pitchforks.

The last private war in Scotland was occasioned by a dispute relating to this county. An earl of Breadalbane married an heiress of Caithness: the inhabitants would not admit her title, but set up another person in opposition. The earl, according to the custom of those times, designed to assert his right by force of arms: he raised an army of 1500 men; but thinking the number too great, he dismissed first one 500, and then another. With the remainder he marched to the borders of Caithness. Here he thought proper to add stratagem to force. He knew that the enemy's army waited for him on the other side of the promontory of Ord. He knew also, that whisky was then the nectar of Caithness; and therefore ordered a ship laden with that precious liquor to pass round, and wilfully strand itself on the shore. The directions were punctually obeyed; and the crew in a seeming fright escaped in the boats to the invading army. The Caithness men made a prize of the ship; but making too free with the freight, became an easy prey to the earl, who attacked them during their intoxication, and gained the county, which he disposed of very soon after his conquest.

CAIUS, KAYE, or Keye, (Dr John), the founder of Caius college in Cambridge, was born at Norwich in 1510. He was admitted very young a student in Gonville-hall in the above mentioned university; and at the age of 21 translated from Greek into Latin some pieces of divinity, and into English Erasmus's paraphrase on Jude, &c. From these his juvenile labours, it seems probable that he first intended to prosecute the study of divinity. Be that as it may, he travelled to Italy, and at Padua studied physic under the celebrated Montanus. In that university he continued some time, where we are told he read Greek lectures with great applause. In 1543, he travelled through part of Italy, Germany, and France; and returning to England commenced doctor of physic at Cambridge. He practised first at Shrewsbury, and afterwards at Norwich; but removing to London, in 1547 he was admitted fellow of the college of physicians, to which he was several years president. In 1557, being then physician to queen Mary, and in great favour, he obtained a licence to advance Gonville-hall, where he had been educated, into a college; which he endowed with several considerable estates, adding an entire new square at the expence of 1834l. Of this college he accepted the mastership, which he kept till within a short time of his death. He was physician to Edward VI. queen Mary, and Queen Elizabeth. Towards the latter end of his life he retired to his own college at Cambridge; where, having resigned the mastership to Dr Legge of Norwich, he spent the remainder of his life as a fellow-commoner. He died in July 1573, aged 63; and was buried in the chapel of his own college. Dr Caius was a learned, active, benevolent man. In 1557, he erected a monument in St Paul's to the memory of the famous Linaere. In 1563, he obtained a grant for the college of physicians to take the bodies of two male-factors

Cake
||
Calabria.

factors annually for dissection; and he was the inventor of the *insignia* which distinguish the president from the rest of the fellows. He wrote, 1. *Annals of the college from 1555 to 1572.* 2. *Translation of several of Galen's works.* Printed at different times abroad. 3. *Hippocrates de Medicamentis*, first discovered and published by our author; also *De ratione victus*, Lov. 1556, 8vo. 4. *De medendi Methodo*. Basil, 1544, Lond. 1556, 8vo. 5. *Account of the sweating sickness in England.* Lond. 1556. 1721. It is entitled *De ephemera Britannica*. 6. *History of the university of Cambridge.* Lond. 1568, 8vo. 1574, 4to. in Latin. 7. *De thermis Britannicis.* Doubtful whether ever printed. 8. *Of some rare plants and animals.* Lond. 1570. 9. *De cannibus Britannicis*, 1570, 1729. 10. *De pronunciatione Græcæ et Latine Lingue.* Lond. 1574. 11. *De libris propriis.* Lond. 1570. Besides many other works which never were printed.

CAKE, a finer sort of bread, denominated from its flat round figure.

We meet with different compositions under the name of *cakes*; as *seed-cakes*, made of flour, butter, cream, sugar, coriander and caraway seeds, mace, and other spices and perfumes baked in the oven; *plum-cake*, made much after the same manner, only with fewer seeds, and the addition of currants; *pan-cakes*, made of a mixture of flour, eggs, &c. fried; *cheese-cakes*, made of cream, eggs, and flour, with or without cheese-curd, butter, almonds, &c. *oat-cakes*, made of fine oaten flour, mixed with yeast and sometimes without, rolled thin, and laid on an iron or stone to bake over a slow fire; *sugar-cakes*, made of fine sugar beaten and searced with the finest flour, adding butter, rosewater, and spices; *rose-cakes*, *placenta rosacea*, are leaves of roses dried and pressed into a mass, sold in the shops for epithems.

The Hebrews had several sorts of cakes, which they offered in the temple. They were made of the meal either of wheat or barley; they were kneaded sometimes with oil and sometimes with honey. Sometimes they only rubbed them over with oil when they were baked, or fried them with oil in a frying pan upon the fire. In the ceremony of Aaron's consecration, they sacrificed a calf and two rams, and offered unleavened bread, and cakes unleavened, tempered with oil, and wafers unleavened anointed with oil; the whole made of fine wheaten flour. Ex. xxix. 1, 2.

CAKET, a town of Asia, in Persia, in the province of Gurgistan near Mount Caucasus. Its trade consists chiefly in silks. E. Long. 46. 15. N. Lat. 43. 32.

CALABASH, in commerce, a light kind of vessel formed of the shell of a gourd, emptied and dried, serving to put divers kinds of goods in, as pitch, rosin, and the like. The word is Spanish, *Calabacca*, which signifies the same. The Indians also, both of the North and South Sea, put the pearls they have fished in calabashes, and the negroes on the coast of Africa do the same by their gold-dust. The smaller calabashes are also frequently used by these people as a measure, by which they sell these precious commodities to the Europeans. The same vessels likewise serve for putting in liquors; and do the office of cups, as well as bottles, for soldiers, pilgrims, &c.

CALABASH-Tree, in botany. See CRESCENTIA.

African CALABASH-Tree. See ADANSONIA.

CALABRIA, a country of Italy, in the kingdom

of Naples, divided into Calabria Ultra, and Calabria Citra, commonly called *Uterior* and *Citerior*, or Farther and Hither Calabria. Calabria Citerior is one of the 12 provinces of the kingdom of Naples; and bounded on the south by Calabria Ultra, on the north by Basilicata, and on the west and east by the sea: Cosenza is the capital. Calabria Ultra is washed by the Mediterranean sea on the east, south, and west, and bounded by Calabria Citra on the north. Reggio is the capital town.

This country has been almost entirely desolated by the earthquakes of 1783. The reiterated shocks extended from Cape Spartivento to Amantea above the gulf of St Eufemia, and also affected that part of Sicily which lies opposite to the southern extremity of Italy. Those of the 5th and 7th of February, and of the 28th of March, were the most violent, and completed the destruction of every building throughout the above-mentioned space. Not one stone was left upon another south of the narrow isthmus of Squillace; and what is more disastrous, a very large proportion of the inhabitants was killed by the falling of their houses, near 40,000 lives being lost. Some persons were dug out alive after remaining a surprising length of time buried among the rubbish. Messina became a mass of ruins; its beautiful palazzata was thrown in upon the town, and its quay cracked into ditches full of water. Reggio almost destroyed; Tropea greatly damaged; every other place in the province levelled to the ground.

Before and during the concussion the clouds gathered, and then hung immovable and heavy over the earth. At Palmi the atmosphere wore so fiery an aspect, that many people thought part of the town was burning. It was afterwards remembered that an unusual heat had affected the skin of several persons just before the shock; the rivers assumed a muddy ash-coloured tinge, and a sulphureous smell was almost general. A frigate passing between Calabria and Lipari felt so severe a shock, that the steersman was thrown from the helm, and the cannons were raised up on their carriages, while all around the sea exhaled a strong smell of brimstone.

Stupendous alterations were occasioned in the face of the country; rivers choaked up by the falling in of the hills, were converted into lakes, which if not speedily drained by some future convulsion, or opened by human labour, will fill the air with pestilential vapours, and destroy the remnants of population. Whole acres of ground, with houses and trees upon them, were broken off from the plains, and washed many furlongs down the deep hollows which the course of the rivers had worn; there, to the astonishment and terror of beholders, they found a new foundation to fix upon, either in an upright or an inclining position. In short, every species of phenomenon, incident to these destructive commotions of the earth, was to be seen in its utmost extent and variety in this ruined country. Their Sicilian majesties, with the utmost expedition, dispatched vessels loaded with every thing that could be thought of on the occasion for the relief and accommodation of the distressed Calabrians; a general officer went from Naples with engineers and troops to direct the operations of the persons employed in clearing away and rebuilding the houses, and to defend the property

Calade
||
Calais.

property of the sufferers. The king ordered this officer to take all the money the royal treasures could supply or borrow; for, rather than it should be wanting on this pressing call, he was determined to part with his plate, nay, the very furniture of his palace. A messenger sent off from a town near Reggio on the 8th of February, travelled four days without shelter, and without being able to procure a morsel of bread; he supported nature with a piece of cheese which he had brought in his pocket, and the vegetables he was lucky enough to find near the road. To add to all their other sufferings, the Calabrians found themselves and the miserable wreck of their fortunes exposed to the depredations of robbers and pirates. Villains landed from boats and plundered several places, and thieves went even from Naples in search of booty: In order to strike a greater terror, they dressed themselves like Algerines; but were discovered and driven off. To this accumulated distress succeeded a most inclement season, which obstructed every effort made to alleviate it; and almost daily earthquakes kept the inhabitants in continual dread, not of being destroyed by the fall of houses, for none were left, but of being swallowed up by the splitting of the earth, or buried in the waves by some sudden inundation.

For further particulars concerning this dreadful catastrophe, and the phenomena attending it, see EARTHQUAKE.

CALADE, in the manege, the descent or sloping declivity of a rising manege ground, being a small eminence, upon which we ride down a horse several times, putting him to a short gallop, with his fore-hams in the air, to learn him to ply or bend his haunches, and form his stop upon the aids of the calves of the legs, the stay of the bridle, and the cavesson seasonably given.

CALAGORINA, or **CALAGURIS**, distinguished by the surname *Nafica* (anc. geog.), a city of the Vascones in the Hither Spain; now *Calaborra*.

CALAHORRA, an episcopal town of Spain, in Old Castile, seated in a fertile soil, on the side of a hill which extends to the banks of the river Ebro. W. Long. 2. 7. N. Lat. 42. 12.

CALAIS, a strong town of France, in Lower Picardy, with a citadel and a fortified harbour. It is built in the form of a triangle, one side of which is towards the sea. The citadel is as large as the town, and has but one entrance. It is a trading place, with handsome streets, and several churches and monasteries; the number of inhabitants is reckoned to be 4000.

Calais was taken by Edward III. in 1347. Hither he marched his victorious army from Crescy, and invested the town on the 8th of September. But finding that it could not be taken by force without the destruction of great multitudes of his men, he turned the siege into a blockade; and having made strong entrenchments to secure his army from the enemy, huts to protect them from the inclemency of the weather, and stationed a fleet before the harbour to prevent the introduction of provisions, he resolved to wait with patience till the place fell into his hands by famine. The besieged, discovering his intention, turned seventeen hundred women, children, and old people, out of the town, to save their provisions; and Edward had the goodness, after entertaining them with a dinner, and giving them twopence a-piece, to suffer them to pass. The garrison

N^o 61.

and inhabitants of Calais having at length consumed all their provisions, and even eaten all the horses, dogs, cats, and vermin, in the place, the governor John de Vienne appeared upon the walls, and offered to capitulate. Edward, greatly incensed at their obstinate resistance, which had detained him eleven months under their walls, at an immense expence both of men and money, sent Sir Walter Manny, an illustrious knight, to acquaint the governor, that he would grant them no terms; but that they must surrender at discretion. At length, however, at the spirited remonstrances of the governor, and the persuasions of Sir Walter Manny, Edward consented to grant their lives to all the garrison and inhabitants, except six of the principal burghesses, who should deliver to him the keys of the city, with ropes about their necks. When these terms were made known to the people of Calais, they were plunged into the deepest distress; and after all the miseries they had suffered, they could not think without horror of giving up six of their fellow-citizens to certain death. In this extremity, when the whole people were drowned in tears, and uncertain what to do, Eustace de Pierre, one of the richest merchants in the place, stepped forth, and voluntarily offered himself to be one of these six devoted victims. His noble example was soon imitated by other five of the most wealthy citizens. These true patriots, barefooted and bareheaded, with ropes about their necks, were attended to the gates by the whole inhabitants, with tears, blessings, and prayers, for their safety. When they were brought into Edward's presence, they laid the keys of the city at his feet, and falling on their knees implored his mercy in such moving strains, that all the noble spectators melted into tears. The king's resentment was so strong for the many toils and losses he had suffered in this tedious siege, that he was in some danger of forgetting his usual humanity; when the queen, falling upon her knees before him, earnestly begged and obtained their lives. This great and good princess conducted these virtuous citizens, whose lives she had saved, to her own apartment, entertained them honourably, and dismissed them with presents. Edward took possession of Calais August 4th; and in order to secure a conquest of so great importance, and which had cost him so dear, he found it necessary to turn out all the ancient inhabitants, who had discovered so strong an attachment to their native prince, and to people it with English.

Calais remained in subjection to England till the reign of queen Mary, when it was retaken by the duke of Guise. This general began the enterprise by ordering the privateers of Normandy and Bretagne to cruise in the channel, more especially in the very straits of Calais: he then detached the duke of Nevers, with a considerable army, towards the country of Luxembourg; a motion which drew the attention of the Spaniards that way: when all things were ready, he procured an application from the people of Boulogne, for a body of troops to secure them against the incursions of the Spaniards; he sent a strong detachment at their request, which was followed by another, under colour of supporting them, then repaired thither in person, secure that his officers would follow his instructions; and thus, on the first day of the new year, 1557, Calais was invested. He immediately at-

Calais.

Calais.

tacked fort St Agatha, which the garrison quitted, and retired into the fort of Nieulai, which, together with the Risbank, the besiegers attacked at the same time, granted good terms to the officer who commanded in the former, but obliged the garrison of the latter to surrender prisoners of war. By these means he opened a communication with the sea; and having received from on board the ships an immense quantity of hurdles, his infantry, by the help of them, passed the morasses that lie round the town. He then made a false attack at the water-gate, which drew the attention of the garrison, who fatigued themselves exceedingly in making entrenchments behind the breach; but when they had finished their work, he began to fire upon the castle, where the walls were very old, and had been neglected on account of the breadth of the ditch, which was also very deep when the tide was in; but a great breach being made, the duke caused it to be attacked in the night, and during the ebb the soldiers passing almost up to the shoulders. The place was easily carried, though the governor made three vigorous attacks before the break of day, in order to dislodge them; but the French, though they lost a considerable number of men, kept their posts. The governor then saw that it was impracticable to defend the place any longer, and therefore made the best terms for himself that he could obtain, which, however, were not very good: and thus in eight days the duke of Guise recovered a fortress which cost the victorious Edward III. a whole year's siege, and which had been now 210 years in the possession of the English, without so much as a single attempt to retake it. There are very different accounts given of this matter: Some English historians say, that king Philip penetrated the design of the French upon this fortress, gave notice of it in England, and offered to take the defence of it upon himself; but that this, out of jealousy, was refused, it being believed to be only an artifice to get a place of such consequence into his own hands. The truth of the matter seems to be this: The strength of Calais consisted in its situation and outworks, which required a very numerous garrison; but this being attended with a very large expence, the best part of the troops had been sent to join Philip's army, so that the governor had not above 500 men, and there were not more than 250 of the townsmen able to bear arms. As to ammunition, artillery, and provisions, the French found there abundance, but with so slender a garrison, that it was impossible to make a better defence; and therefore, when the lord Wentworth, who was governor, and whom the French call lord Dumfort, was tried by his peers for the loss of this place, he was acquitted. The duke obliged all the English inhabitants to quit Calais; and bestowed the government of it upon des Termes, who was soon after made a marshal of France.

The fortifications of Calais are good; but its greatest strength is its situation among the marshes, which may be overflowed at the approach of an enemy. The harbour is not so good as formerly, nor will it admit vessels of any great burden. In times of peace, there are packet-boats going backward and forward twice a week from Dover to Calais, which is 21 miles distant. E. Long. 2. 6. N. Lat. 50. 58.

CALAIS and Zetes, in fabulous history, sons of Bo-
VOL. IV. Part I.

reas and Orythia, to whom the poets attributed wings: they went on the voyage of Colchis with the Argonauts, delivered Phineus from the harpies, and were slain by Hercules.

CALAMANCO, a sort of woollen stuff manufactured in England and Brabant. It has a fine gloss; and is checkered in the warp, whence the checks appear only on the right side. Some calamancos are quite plain, others have broad stripes adorned with flowers, some with plain broad stripes, some with narrow stripes, and others watered.

CALAMARIÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus; in which he has the following genera, viz. bobartia, scirpus, cyperus, eriophorum, carex, schænus, flagellaria, juncus. See BOTANY.

CALAMATA, a considerable town of Turkey in Europe, in the Morea, and province of Belvedera. It was taken by the Venetians in 1685; but the Turks retook it afterwards with all the Morea. It stands on the river Spinarza, eight miles from the sea. E. Long. 22. 15. N. Lat. 37. 8.

CALAMINE, **CALAMY**, *Lapis Calaminaris*, or *Cadmia Fossilis*, a sort of stone or mineral, containing zinc, iron, and sometimes other substances. It is considerably heavy, and the more so the better; moderately hard and brittle, or of a consistence betwixt stone and earth: the colour is sometimes whitish or grey; sometimes yellowish, or of a deep yellow; sometimes red; sometimes brown or blackish. It is plentiful in several places of Europe, as Hungary, Transylvania, Poland, Spain, Sweden, Bohemia, Saxony, Gossar, France, and England, particularly in Derbyshire, Gloucestershire, Nottinghamshire, and Somersetshire; as also in Wales. The calamine of England, however, is by the best judges allowed to be superior in quality to that of most other countries. It seldom lies very deep, being chiefly found in clayey grounds near the surface. In some places it is mixed with lead-ores. It is the only true ore of zinc, and is used as an ingredient in making of brass.—Newmann relates various experiments with this mineral, the only result of which was to show that it contained iron as well as zinc. The most remarkable are the following. A saturated solution of calamine in the marine acid, concentrated by evaporating part of the liquor, exhibits in the cold an appearance of fine crystals, which on the application of warmth dissolve and disappear. A little of this concentrated solution tinges a large quantity of water of a bright yellow colour; and at the same time deposits by degrees a fine, spongy, brownish precipitate. Glue dissolved in this solution, and afterwards inspissated, forms an extremely slippery tenacious mass, which does not become dry, and, were it not too expensive, might be of use for entangling flies, caterpillars, &c. Sulphur boiled in the solution seems to acquire some degree of transparency.—This mineral is an article in the materia medica; but, before it comes to the shops, is usually roasted or calcined, in order to separate some arsenical or sulphureous matter which in its crude state it is supposed to contain, and to render it more easily reducible into a fine powder. In this state it is employed in collyria against defluxions of thin acrid humours upon the eyes, for drying up moist running ulcers, and healing excoriations. It is the basis of an officinal epulotic CERATE.

Calamy

Though the lapis calaminaris is the only native ore of zinc, there is another substance from which that semi-metal is also obtained. This is called *cadmia fornacum*, or *cadmia of the furnaces*, to distinguish it from the other. This is a matter sublimed when ores containing zinc, like those of Rammelsberg, are smelted. This *cadmia* consists of the flowers of the semi-metal sublimed during the fusion, and adhering to the inner surfaces of the walls of furnaces, where they suffer a semi-fusion, and therefore acquire some solidity. So great a quantity of these are collected, that they form very thick incrustations, which must be frequently taken off. The name of *cadmia of the furnaces* has also been given to all the soots and metallic sublimes formed by smelting in the great, although there is certainly a difference in these matters.

CALAMINT, in botany. See MELISSA, and MENTHA.

CALAMUS, in botany; A genus of the monogynia order, belonging to the hexandria class of plants; and in the natural method ranking under the 5th order, *Tripelaloidea*. The calyx is hexaphyllous, there is no corolla, the fruit is a dry monospermous berry, imbricated backwards. There is but one species, the rotang. The stem is without branches, has a crown at top, and is every where beset with straight spines. This is the true Indian cane, which is not visible on the outside; but the bark being taken off discovers the smooth stick, which has no marks of spine on the bark, and is exactly like those which the Dutch sell to us; keeping this matter very secret, lest travellers going by should take as many canes out of the woods as they please. Sumatra is said to be the place where most of these sticks grow. Such are to be chosen as are of proper growth between two joints, suitable to the fashionable length of canes as they are then worn: but such are scarce.—The *calamus rotang* is one of several plants from which the drug called Dragon's-blood is obtained.

CALAMUS, in the ancient poets, denotes a simple kind of pipe or fistula, the musical instrument of the shepherds and herdsmen; usually made either of an oaten stalk or a reed.

CALAMUS *Aromaticus*, or *Sweet-scented Flag*, in the materia medica, a species of flag called *acorus* by Linnaeus. See ACORUS.

CALAMUS *Scriptorius*, in antiquity, a reed or rush to write with. The ancients made use of styles to write on tables covered with wax; and of reed, or rush, to write on parchment, or Egyptian paper.

CALAMY (Edmund), an eminent Presbyterian divine, born at London in the year 1600, and educated at Pembroke-hall, Cambridge, where his attachment to the Armenian party excluded him from a fellowship. Dr Felton bishop of Ely, however, made him his chaplain; and, in 1639, he was chosen minister of St Mary Aldermary, in the city of London. Upon the opening of the long parliament, he distinguished himself in defence of the Presbyterian cause; and had a principal hand in writing the famous *Smectymnus*, which, himself says, gave the first deadly blow to episcopacy. The authors of this tract were five, the initials of whose names formed the name under which it was published; viz. Stephen Marshal, Edmund Calamy, Thomas Young, Matthew Newcomen, and William Sparrow.

He was after that an active member in the assembly of divines, was a strenuous opposer of sectaries, and used his utmost endeavours to prevent those violences committed after the king was brought from the isle of Wight. In Cromwell's time he lived privately, but was assiduous in promoting the king's return; for which he was afterwards offered a bishopric, but refused it. He was ejected for nonconformity in 1662; and died of grief at the sight of the great fire of London.

CALAMY (Edmund), grandson to the preceding (by his eldest son Mr Edmund Calamy, who was ejected out of the living of Moxton in Essex on St Bartholomew's day 1662), was born in London, April 5th 1671. After having learned the languages, and gone through a course of natural philosophy and logic at a private academy in England, he studied philosophy and civil law at the university of Utrecht, and attended the lectures of the learned Grævius. Whilst he resided here, an offer of a professor's chair in the university of Edinburgh was made him by Mr Carstairs, principal of that university, sent over on purpose to find a person properly qualified for such an office. This he declined; and returned to England in 1691, bringing with him letters from Grævius to Dr Pocock canon of Christchurch and regius professor of Hebrew, and to Dr Bernard Savilian professor of astronomy, who obtained leave for him to prosecute his studies in the Bodleian library. Having resolved to make divinity his principal study, he entered into an examination of the controversy between the conformists and nonconformists; which determined him to join the latter: and coming to London in 1692, he was unanimously chosen assistant to Mr Matthew Sylvester at Blackfriars; and in 1694, he was ordained at Mr Annesly's meeting-house in Little St-Helena, and soon after was invited to become assistant to Mr Daniel Williams in Hand-Alley. In 1702, he was chosen to be one of the lecturers in Salter's-hall; and, in 1703, succeeded Mr Vincent Alsop as pastor of a great congregation in Westminster. He drew up the table of contents to Mr Baxter's history of his life and times, which was sent to the press in 1696; made some remarks on the work itself, and added to it an index; and, reflecting on the usefulness of the book, he saw the expediency of continuing it, for Mr Baxter's history came no lower than the year 1684. Accordingly he composed an abridgement of it, with an account of many other ministers who were ejected after the restoration of Charles II.; their apology, containing the grounds of their nonconformity and practice as to stated and occasional communion with the church of England; and a continuation of their history till the year 1691. This work was published in 1702. He afterwards published a moderate defence of nonconformity, in three tracts, in answer to some tracts of Dr Hoadley. In 1709, Mr Calamy made a tour to Scotland; and had the degree of doctor of divinity conferred on him by the universities of Edinburgh, Aberdeen, and Glasgow. In 1713, he published a second edition of his *Abridgement of Mr Baxter's history of his life and times*; in which, among other additions, there is a continuation of the history through king William's reign, and queen Anne's, down to the passing of the occasional bill; and in the close is subjoined the reformed liturgy, which was

drawn:

Calandre,
Calas.

drawn up and presented to the bishops in 1661, "that the world may judge (he says in his preface) how fairly the ejected ministers have been often represented as irreconcilable enemies to all liturgies." In 1718, he wrote a vindication of his grandfather, and several other persons, against certain reflections cast upon them by Mr Archdeacon Echard in his History of England; and in 1728 appeared his Continuation of the account of the ministers, lecturers, masters, and fellows of colleges, and schoolmasters, who were ejected, after the restoration in 1660, by or before the act of uniformity. He died June 3d 1732, greatly regretted not only by the dissenters, but also by the moderate members of the established church, both clergy and laity, with many of whom he lived in great intimacy. Besides the pieces already mentioned, he published a great many sermons on several subjects and occasions. He was twice married, and had 13 children.

CALANDRE, a name given by the French writers to an insect that does vast mischief in granaries. It is properly of the scarab or beetle class; it has two antennæ or horns formed of a great number of round joints, and covered with a soft and short down; from the anterior part of the head there is thrust out a trunk, which is so formed at the end, that the creature easily makes way with it through the coat or skin that covers the grain, and gets at the meal or farina on which it feeds; the inside of the grains is also the place where the female deposits her eggs, that the young progeny may be born with provision about them. When the female has pierced a grain of corn for this purpose, she deposits in it one egg, or at the utmost two, but she most frequently lays them single: these eggs hatch into small worms, which are usually found with their bodies rolled up in a spiral form, and after eating till they arrive at their full growth, they are changed into chrysales, and from these in about a fortnight comes out the perfect calandre. The female lays a considerable number of eggs; and the increase of these creatures would be very great: but nature has so ordered it, that while in the egg state, and even while in that of the worm, they are subject to be eaten by mites; these little vermin are always very plentiful in granaries, and they destroy the far greater number of these larger animals.

CALAS (John), the name of a most unfortunate Protestant merchant at Thoulouse, inhumanly butchered under forms of law cruelly prostituted to shelter the sanguinary dictates of ignorant Popish zeal. He had lived 40 years at Thoulouse. His wife was an English woman of French extraction: and they had five sons; one of whom, Lewis, had turned Catholic through the persuasions of a Catholic maid who had lived 30 years in the family. In October 1761, the family consisted of Calas, his wife, Mark Anthony their son, Peter their second son, and this maid. Anthony was educated for the bar; but being of a melancholy turn of mind, was continually dwelling on passages from authors on the subject of suicide, and one night in that month hanged himself on a bar laid across two folding doors in their shop. The crowd collected by the confusion of the family on so shocking a discovery, took it into their heads that he had been strangled by the family to prevent his changing his religion, and

that this was a common practice among protestants. The officers of justice adopted the popular tale, and were supplied by the mob with what they accepted as evidences of the fact. The fraternity of white penitents got the body, buried it with great ceremony, and performed a solemn service for him as a martyr; the Franciscans did the same: and after these formalities no one doubted the guilt of the devoted heretical family. They were all condemned to the torture, to bring them to confession: they appealed to the parliament; who, as weak and as wicked as the subordinate magistrates, sentenced the father to the torture ordinary and extraordinary, to be broken alive upon the wheel, and then to be burned to ashes. A diabolical decree! which, to the shame of humanity, was actually carried into execution. Peter Calas, the other son, was banished for life; and the rest were acquitted. The distracted widow found some friends, and among the rest M. Voltaire, who laid her case before the council of state at Versailles, and the parliament of Thoulouse were ordered to transmit the proceedings. These the king and council unanimously agreed to annul; the capitoul, or chief magistrate of Thoulouse, was degraded and fined; old Calas was declared to have been innocent; and every imputation of guilt was removed from the family, who also received from the king and clergy considerable gratuities.

CALASH, or CALESH, a small light kind of chariot or chair, with very low wheels, used chiefly for taking the air in parks and gardens. The calash is for the most part richly decorated, and open on all sides for the convenience of the air and prospect, or at most inclosed with light mantlets of wax-cloth to be opened and shut at pleasure. In the Philosophical Transactions we have a description of a new sort of calash going on two wheels, not hung on traces, yet easier than the common coaches, over which it has this further advantage, that whereas a common coach will overturn if one wheel go on a surface a foot and an half higher than the other, this will admit of a difference of $3\frac{1}{2}$ feet without danger of overturning. Add, that it would turn over and over; that is, after the spokes being so turned as that they are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed *in situ quo*, without any disorder to the horse or rider.

CALASIO (Marius), a Franciscan, and professor of the Hebrew language at Rome, of whom there is very little to be said, but that he published there, in the year 1621, a Concordance of the Bible, which consisted of four great volumes in folio. This work has been highly approved and commended both by Protestants and Papists, and is indeed a most admirable work. For besides the Hebrew words in the Bible, which are in the body of the book, with the Latin version over against them; there are, in the margin, the differences between the septuagint version and the vulgate; so that at one view may be seen wherein the three Bibles agree, and wherein they differ. Moreover, at the beginning of every article there is a kind of dictionary, which gives the signification of each Hebrew word; affords an opportunity of comparing it with other oriental languages, viz. with the Syriac, Arabic, and Chaldee; and is extremely useful

Calash,
Calasio.

Calasiris
||
Calauria.

for determining more exactly the true meaning of the Hebrew words.

CALASIRIS, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woollen garment: but this last they were obliged to pull off when they entered the temples, being only allowed to appear there in linen garments.

CALATAJUD, a large and handsome town of Spain, in the kingdom of Arragon; situated at the confluence of the rivers Xalon and Xiloca, at the end of a very fertile valley, with a good castle on a rock. W. Long. 2. 9. N. Lat. 41. 22.

CALATHUS, in antiquity, a kind of hand-basket made of light wood or rushes; used by the women sometimes to gather flowers, but chiefly, after the example of Minerva, to put their work in. The figure of the calathus, as represented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. Pliny compares it to that of a lily. The Calathus or work-basket of Minerva is no less celebrated among the poets than her distaff.

CALATHUS was also the name of a cup for wine, used in sacrifices.

CALATOR, in antiquity, a cryer, or officer appointed to publish something aloud, or call the people together. The word is formed from *καλίσω, voco, I call*. Such ministers the pontifices had, whom they used to send before them when they went to sacrifice on *feria* or holidays, to advertise the people to leave off work. The magistrates also used *calatores*, to call the people to the comitia, both *curiata* and *centuriata*. The officers in the army also had *calatores*; as had likewise many private families, to invite their guests to entertainments.

CALATRAVA, a city of New Castile, in Spain, situated on the river Guadiana, 45 miles south of Toledo. W. Long. 4. 20. N. Lat. 39. 0.

Knights of CALATRAVA, a military order in Spain, instituted under Sancho III. king of Castile, upon the following occasion. When that prince took the strong fort of Calatrava from the moors of Andalusia, he gave it to the templars, who, wanting courage to defend it, returned it him again. Then Don Reymond, of the order of the Cistercians, accompanied with several persons of quality, made an offer to defend the place, which the king thereupon delivered up to them, and instituted that order. It increased so much under the reign of Alphonfus, that the knights desired they might have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of pope Innocent VIII. re-united the grand-mastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof.

The knights of Calatrava bear a cross gules, flowered with green, &c. Their rule and habit was originally that of the Cistercians.

CALAURIA (anc. geog.), an island of Greece in the Saronic bay, overagainst the port of Troezen, at the distance of 40 stadia. Hither Demosthenes went twice into banishment; and here he died. Neptune was said to have accepted this island from Apollo in exchange for Delos. The city stood on a high ridge nearly in the middle of the island, commanding an extensive view of the gulf and its coasts. There

was his holy temple. The priestess was a virgin, who was dismissed when marriageable. Seven of the cities near the island held a congress at it, and sacrificed jointly to the deity. Athens, Ægina, and Epidaurus were of this number, with Nauplia, for which place Argos contributed. The Macedonians, when they had reduced Greece, were afraid to violate the sanctuary, by forcing from it the fugitives, his suppliants. Antipater commanded his general to bring away the orators, who had offended him, alive; but Demosthenes could not be prevailed on to surrender. His monument remained in the second century, within the inclosure of the temple. The city of Calauria has been long abandoned. Traces of buildings, and of ancient walls, appear nearly level with the ground; and some stones, in their places, each with a seat and back, forming a little circle, once perhaps a bath. The temple, which was of the Doric order, and not large, as may be inferred from the fragments, is reduced to an inconsiderable heap of ruins. The island is now called *Poro*. It stretches along before the coast of the Morea in a lower ridge, and is separated from it by a canal only four stadia or half a mile wide. This, which is called *Poro* or the *Ferry*, in still weather may be passed on foot, as the water is not deep. It has given its name to the island; and also to the town, which consists of about 200 houses, mean and low, with flat roofs; rising on the slope of a bare disagreeable rock.

CALCADA, or *St Dimingo CALCALDA*, a town of Spain, situated in W. Long. 3. 5. N. Lat. 42. 36.

CALCAR, a very strong town of Germany, in the circle of Westphalia, and duchy of Cleves. It belongs to the king of Prussia, and is seated near the Rhine, in E. Long. 5. 41. N. Lat. 51. 45.

CALCAR, in glass-making, the name of a small oven, or reverberatory furnace, in which the first calcination of sand and salt of potashes is made for the turning them into what is called *frit*. This furnace is made in the fashion of an oven, ten feet long, seven broad in the widest part, and two feet deep. On one side of it is a trench six inches square, the upper part of which is level with the calcar, and separated only from it at the mouth by bricks nine inches wide. Into this trench they put sea-coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the frit, over the surface of which the smoke flies very black, and goes out at the mouth of the calcar; the coals burn on iron-grates, and the ashes fall through.

CALCAR (John de), a celebrated painter, was the disciple of Titian, and perfected himself by studying Raphael. Among other pieces he drew a nativity, representing the angels around the infant Christ; and so ordered the disposition of his picture, that the light all proceeds from the child. He died at Naples, in 1546, in the flower of his age. It was he who designed the anatomical figures of Vesal, and the portraits of the painters of Vefari.

CALCAREOUS, something that partakes of the nature and qualities of CALX, or lime. We say, a *calcareous* earth, *calcareous* stone. See *CHEMISTRY-Index*.

CALCEARIUM, in antiquity, a donative or largess bestowed on Roman soldiers for buying shoes. In monasteries, *calcearium* denoted the daily service of cleaning the shoes of the religious.

Calceda
||
Calcearium.

Calceolaria
||
Calculus.

CALCEOLARIA, in botany; a genus of the monogynia order, belonging to the diandria class of plants. The corolla is ringent and inflated; the capsule has two cells, and two valves; the calyx four parted and equal.

CALCHAS, in fabulous history, a famous diviner, followed the Greek army to Troy. He foretold that the siege would last ten years; and that the fleet, which was detained in the port of Aulis by contrary winds, would not sail till Agamemnon's daughter had been sacrificed to Diana. After the taking of Troy, he retired to Colophon; where, it is said, he died of grief, because he could not divine what another of his profession, called *Mopsus*, had discovered.

CALCINATION, in chemistry, the reducing of substances to a calx by fire. See *CHEMISTRY-Index*.

CALCINATO, a town of Italy, in the duchy of Mantua, remarkable for a victory gained over the Imperialists by the French in 1706. E. Long. 9. 55. N. Lat. 45. 25.

CALCULARY of a *PEAR*, a congeries of little strong knots dispersed through the whole parenchyma of the fruit. The calculary is most observed in rough-tasted or choak-pears. The knots lie more continuous and compact together towards the pear where they surround the *acetary*. About the stalk they stand more distant; but towards the cork, or stool of the flower, they still grow closer, and there at last gather into the firmness of a plumb-stone. The calculary is no vital or essential part of the fruit; the several knots whereof it consists being only so many concretions or precipitations out of the sap, as we see in urines, wines, and other liquors.

CALCULATION, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See *ARITHMETIC*.

CALCULATION is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the time of eclipses, &c. See *ASTRONOMY*, *GEOMETRY*, and *LOGARITHMS*.

CALCULUS, primarily denotes a little stone or pebble, anciently used in making computations, taking of suffrages, playing at tables, and the like. In after-times, pieces of ivory, and counters struck of silver, gold, and other matters, were used in lieu thereof, but still retaining the ancient names. Computists were by the lawyers called *calculones*, when they were either slaves or newly freed men; those of a better condition were named *calculatores* or *numerarii*: ordinarily there was one of these in each family of distinction. The Roman judges anciently gave their opinions by calculi, which were white for absolution, and black for condemnation. Hence *calculus albus*, in ancient writers, denotes a favourable vote, either in a person to be absolved and acquitted of a charge, or elected to some dignity or post; as *calculus niger* did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by *white*, and their unhappy by *black*, pebbles, put each night into an urn.

Besides the diversity of colour, there were some calculi also which had figures or characters engraven on them, as those which were in use in taking the suffrages both in the senate and at assemblies of the people. These calculi were made of thin wood, polished and

covered over with wax. Their form is still seen in some medals of the Cassian family; and the manner of casting them into the urns, in the medals of the Licinian family. The letters marked upon these calculi were U. R. for *uti rogas*, and A. for *antiquo*; the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges who sat in capital causes used calculi marked with the letter A. for *absolvo*; C. for *condemno*; and N. L. for *non liquet*, signifying that a more full information was required.

Calculus is also used in ancient grammatic writers for a kind of weight equal to two grains of cicer. Some make it equivalent to the siliqua, which is equal to three grains of barley. Two calculi made the *ceratium*.

CALCULUS Differentialis is a method of differencing quantities, or of finding an infinitely small quantity, which, being taken infinite times, shall be equal to a given quantity: or, it is the arithmetic of the infinitely small differences of variable quantities.

The foundation of this calculus is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal. Thus, in Astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term, infinitesimal, therefore, is merely respective, and involves a relation to another quantity; and does not denote any real ens, or being. Now infinitesimals are called *differentials*, or *differential quantities*, when they are considered as the differences of two quantities. Sir Isaac Newton calls them *moments*; considering them as the momentary increments of quantities, v. g. of a line generated by the flux of a point, or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the same thing under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lay claim to the discovery. There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals; the one as moments, the other as differences: Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter *d*: thus the differential of *x* is called *dx*; and that of *y*, *dy*: now *dx* is a positive quantity, if *x* continually increase; negative, if it decrease. The English, with Sir Isaac Newton, instead of *dx* write $\dot{x}$ (with a dot over it;) for *dy*, $\dot{y}$, &c. which foreigners object against, on account of that confusion of points, which they imagine arises when differentials are again differenced; besides, that the printers are more apt to overlook a point than a letter. Stable quantities being always expressed by the first letters of the alphabet $da=0$, $db=0$, $dc=0$; wherefore $d(x+y-a) = dx+dy$, and $d(x-y+a) = dx-dy$. So that the differencing of quantities is easily performed, by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought: thus, the quantities being *xy*, the dif-

Calculus.

Calculus. differential will be $x dy + y dx$, i. e. $d(xy) = x dy + y dx$. Secondly, if there be three quantities mutually multiplying each other, the factum of the two must then be multiplied into the differential of the third: thus suppose vxy , let $vx = t$, then $vxy = ty$; consequently $d(vxy) = t dy + y dt$: but $dt = v dx + x dv$. These values, therefore, being substituted in the antecedent differential, $t dy + y dt$, the result is, $d(vxy) = vx dy + vy dx + xy dv$. Hence it is easy to apprehend how to proceed, where the quantities are more than three. If one variable quantity increase, while the other y decreases, it is evident $y dx - x dy$ will be the differential of xy .

To difference quantities that mutually divide each other; the rule is, first, multiply the differential of the divisor into the dividend; and, on the contrary, the differential of the dividend into the divisor; subtract the last product from the first, and divide the remainder by the square of the divisor; the quotient is the differential of the quantities mutually dividing each other. See FLUXIONS.

CALCULUS Exponentialis, is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantity, is here understood a power, whose exponent is variable; v. g. x^x , a^x , x^y . where the exponent x does not denote the same in all the points of a curve, but in some stands for 2, in others for 3, in others for 5, &c.

To difference an exponential quantity; there is nothing required but to reduce the exponential quantities to logarithmic ones; which done, the differencing is managed as in logarithmic quantities.—Thus, suppose the differential of the exponential quantity x^y required, let

$$x^y = z$$

Then will $y \log x = \log z$

$$\log x dy + \frac{y dx}{x} = \frac{dz}{z}$$

$$z \log x dy + \frac{z y dx}{x} = dz$$

That is, $x^y \log x dy + x^{y-1} dx = dz$.

CALCULUS Integralis, or **Summatorius**, is a method of integrating, or summing up moments, or differential quantities; i. e. from a differential quantity given, to find the quantity from whose differencing the given differential results.

The integral calculus, therefore, is the inverse of the differential one: whence the English, who usually call the differential method *fluxions*, give this *calculus*, which ascends from the fluxions, to the flowing or variable quantities: or, as foreigners express it, from the differences to the sums, by the name of the *inverse method of fluxions*.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the differential calculus, being differenced, produce that proposed to be summed.

Suppose f the sign of the sum, or integral quantity,

then $f y dx$ will denote the sum, or integral of the differential $y dx$.

To integrate, or sum up a differential quantity: It is demonstrated, first, that $\int dx = x$; secondly, $\int (dx + dy) = x + y$; thirdly, $\int (x dy + y dx) = xy$; fourthly, $\int (m x^{m-1} dx) = x^m$; fifthly, $\int (n : m) x^{\frac{n-m}{m}} dx = x^{\frac{n}{m}}$:

sixthly, $\int (y dx - x dy) : y^2 = x : y$. Of these, the fourth and fifth cases are the most frequent, wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the new exponent multiplied into the differential of the root; v. g. the fourth case, by $m - (1 + 1) dx$, i. e. by $m dx$.

If the differential quantity to be integrated doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finites, any quantity may be raised to any degree of power; but *vice versa*, the root cannot be extracted out of any number required: so in the analysis of infinites, any variable or flowing quantity may be differenced; but *vice versa*, any differential cannot be integrated. And as, in the analysis of finites, we are not yet arrived at a method of extracting the roots of all equations, so neither has the integral calculus arrived at its perfection: and as in the former we are obliged to have recourse to approximation, so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

CALCULUS Literalis, or **Literal CALCULUS**, is the same with specious arithmetic, or algebra, so called from its using the letters of the alphabet; in contradistinction to numeral arithmetic, which uses figures. In the literal calculus given quantities are expressed by the first letters, $a b c d$; and quantities sought by the last $x y z$, &c. Equal quantities are denoted by the same letters.

CALCULUS Minerva, among the ancient lawyers, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Orestes, represented by Æschylus and Euripides; at whose trial, before the Areopagites, for the murder of his mother, the votes being equally divided for and against him, Minerva interposed, and gave the casting vote or calculus in his behalf.

M. Cramer, professor at Marburg, has a discourse express, *De Calculo Minervæ*; wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cause *in statu quo*.

CALCULUS Tiburtinus, a sort of figured stone, formed in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white colour, and in shape oblong, round, or echinated. They are a species of the *stria lapideæ*, and generated like them; and so like sugar-plums in the whole, that it is a common jest at Rome to deceive the unexperienced by serving them up at deserts.

CALCULUS, in Medicine, the disease of the stone in the bladder, or kidneys. The term is Latin, and signifies a *little pebble*. The calculus in the bladder is called *lithiasis*; and in the kidneys, *nephritis*. See MEDICINE and SURGERY.

Human calculi are commonly formed of different strata

Calcutta. strata or incrustations; sometimes smooth and heavy like mineral stones; but oftener rough, spongy, light, and full of inequalities or protuberances: chemically analysed, or distilled in an open fire, they nearly yield the same principles as urine itself, or at least an empyreumatic volatile urinous matter, together with a great deal of air. They never have, nor can have, naturally, any foreign matter for a basis: but they may by accident; an instance of which is related by Dr Percival*. A bougie had unfortunately slipped into the bladder, and upon it a stone of a considerable size was formed in less than a year. This stone had so much the appearance of chalk, that the Doctor was induced to try whether it could be converted into quicklime. His experiment succeeded, both with that and some other calculi; from which he conjectures, that hard waters which contain calcareous earth may contribute towards the formation of these calculi.

Vol. III.
P. 165.

CALCUTTA, the capital of the province of Bengal, and of all the British possessions in the East Indies, is situated on the river Huguely, a branch of the Ganges, about 100 miles from the sea, in N. Lat. 23. and 88. 28. E. Long. from Greenwich. It is but a modern city, built on the site of a village called *Govindpour*. The English first obtained the Mogul's permission to settle in this place in the year 1690; and Mr Job Channock, the company's agent, made choice of the spot on which the city stands, on account of a large shady grove which grew there; though in other respects it was the worst he could have pitched upon; for three miles to the north coast, there is a salt-water lake, which overflows in September, and when the flood retires in December, leaves behind such a quantity of fish and other putrescent matter, as renders the air very unhealthy. The custom of the Gentoos throwing the dead bodies of their poor people into the river is also very disgusting, and undoubtedly contributes to render the place unhealthy, as well as the cause already mentioned.

Calcutta is now become a large and populous city, being supposed at present to contain 500,000 inhabitants. It is elegantly built, at least the part inhabited by the English; but the rest, and that the greatest part, is built after the fashion of the cities of India in general. The plan of all these is nearly the same; their streets are exceedingly confined, narrow, and crooked, with a vast number of ponds, reservoirs, and gardens interspersed. A few of the streets are paved with brick. The houses are built, some with brick, others with mud, and a still greater number with bamboes and mats; all which different kinds of fabrics standing intermixed with one another, form a very uncouth appearance. The brick houses are seldom above two stories high, but those of mud and bamboes are only one, and are covered with thatch. The roofs of the brick houses are flat and terraced. These, however, are much fewer in number than the other two kinds; so that fires, which often happen, do not sometimes meet with a brick house to obstruct their progress in a whole street. Within these 20 or 25 years Calcutta has been greatly improved both in appearance and in the salubrity of its air: the streets have been properly drained, and the ponds filled; thereby removing a vast surface of stagnant water, the exhalations of which were particularly hurtful. The citadel is named Fort

William, and is superior as a fortress to any in India; but is now on too extensive a scale to answer the purpose for which it was intended, viz. the holding a post in case of extremity. It was begun on this extended plan by lord Clive immediately after the battle of Plassey. The expence attending it was supposed to amount to two millions Sterling.

Calcutta is the emporium of Bengal, and the residence of the governor-general of India. Its flourishing state may in a great measure be supposed owing to the unlimited toleration of all religions allowed here; the Pagans being suffered to carry their idols in procession, the Mahomedans not being discountenanced, and the Roman Catholics being allowed a church.— At about a miles distance from the town is a plain where the natives annually undergo a very strange kind of penance on the 9th of April; some for the sins they have committed, others for those they may commit, and others in consequence of a vow made by their parents. This ceremony is performed in the following manner. Thirty bamboes, each about the height of 20 feet, are erected in the plain above mentioned. On the top of these they contrive to fix a swivel, and another bamboe of thirty feet or more crosses it, at both ends of which hangs a rope. The people pull down one end of this rope, and the devotee placing himself under it, the Brahmin pinches up a large piece of skin under both the shoulderblades, sometimes in the breasts, and thrusts a strong iron hook through each. These hooks have lines of Indian grass hanging to them, which the priest makes fast to the rope at the end of the cross bamboe, and at the same time puts a sash round the body of the devotee, laying it loosely in the hollow of the hooks, lest by the skin's giving way, he should fall to the ground. When this is done, the people haul down the other end of the bamboe; by which means the devotee is immediately lifted up 30 feet or more from the ground, and they run round as fast as their legs can carry them. Thus the devotee is thrown out the whole length of the rope, where, as he swings, he plays a thousand antic tricks; being painted and dressed in a very particular manner, on purpose to make him look more ridiculous. Some of them continue swinging half an hour, others less. The devotees undergo a preparation of four days for this ceremony. On the first and third they abstain from all kinds of food; but eat fruit on the other two. During this time of preparation they walk about the streets in their fantastical dresses, dancing to the sound of drums and horns; and some, to express the greater ardour of devotion, run a rod of iron quite through their tongues, and sometimes through their cheeks also.

Before the war of 1755, Calcutta was commonly garrisoned by 300 Europeans, who were frequently employed in conveying the company's vessels from Patna, loaded with salt-petre, piece-goods, opium, and raw silk. The trade of Bengal alone supplied rich cargoes for 50 or 60 ships annually, besides what was carried on in small vessels to the adjacent countries. It was this flourishing state of Calcutta that probably was one motive for the Nabob Surajah Dowla to attack it in the year 1756. Having had the fort of Cossimbuzar delivered up to him, he marched against Calcutta with all his forces, amounting to 70,000 horse and foot, with

Calcutta.

Calcutta.

with 400 elephants, and invested the place on the 15th of June. Previous to any hostilities, however, he wrote a letter to Mr Drake the governor, offering to withdraw his troops, on condition that he would pay him his duty on the trade for 15 years past, defray the expence of his army, and deliver up the black merchants who were in the fort. This being refused, he attacked one of the redoubts at the entrance of the town; but was repulsed with great slaughter. On the 16th he attacked another advanced post, but was likewise repulsed with great loss. Notwithstanding this disappointment, however, the attempt was renewed on the 18th, when the troops abandoned these posts, and retreated into the fort; on which the Nabob's troops entered the town, and plundered it for 24 hours. An order was then given for attacking the fort; for which purpose a small breast-work was thrown up, and two twelve pounders mounted upon it; but without firing oftener than two or three times an hour. The governor then called a council of war, when the captain of the train informed them, that there was not ammunition in the fort to serve three days; in consequence of which the principal ladies were sent on board the ships lying before the fort. They were followed by the governor, who declared himself a quaker, and left the place to be defended by Mr Holwell the second in council. Besides the governor, four of the council, eight gentlemen in the company's service, four officers, and 100 soldiers, with 52 free merchants, captains of ships, and other gentlemen, escaped on board the ships, where were also 59 ladies, with 33 of their children. The whole number left in the fort were about 250, effective men, with Mr Holwell, four captains, five lieutenants, six ensigns, and five serjeants; as also 14 sea-captains, and 29 gentlemen of the factory. Mr Holwell then having held a council of war, divided three chests of treasure among the discontented soldiers; making them large promises also, if they behaved with courage and fidelity; after which he boldly stood on the defence of the place, notwithstanding the immense force which opposed him. The attack was very vigorous; the enemy having got possession of the houses, galled the English from thence, and drove them from the bastions; but they themselves were several times dislodged by the fire from the fort, which killed upwards of 12,000 men, with the loss of only five English soldiers the first day. The attack, however, was continued till the afternoon of the 20th; when many of the garrison being killed and wounded, and their ammunition almost exhausted, a flag of truce was hung out. Mr Holwell intended to have availed himself of this opportunity to make his escape on board the ships, but they had fallen several miles down from the fort, without leaving even a single boat to facilitate the escape of those who remained. In the mean time, however, the back-gate was betrayed by the Dutch guard, and the enemy, entering the fort, killed all they first met, and took the rest prisoners.

The fort was taken before six in the evening; and, in an hour after, Mr Holwell had three audiences of the Nabob, the last being in the durbar or council. In all of these the governor had the most positive assurances that no harm should happen to any of the prisoners; but he was surprised and enraged at finding

No 61.

only 5000l. in the fort, instead of the immense treasures he expected; and to this, as well as perhaps to the resentment of the jemmidaars or officers, of whom many were killed in the siege, we may impute the catastrophe that followed.

As soon as it was dark, the English prisoners, to the number of 146, were directed by the jemmidaars who guarded them, to collect themselves into one body, and sit down quietly under the arched veranda, or piazza, to the westward of the black-hole prison. Besides the guard over them, another was placed at the south-end of this veranda, to prevent the escape of any of them. About 500 gunmen, with lighted matches, were drawn up on the parade; and soon after the factory was in flames to the right and left of the prisoners, who had various conjectures on this appearance. The fire advanced with rapidity on both sides; and it was the prevailing opinion of the English, that they were to be suffocated between the two fires. On this they soon came to a resolution of rushing on the guard, seizing their scymitars, and attacking the troops upon the parade, rather than be thus tamely roasted to death: but Mr Holwell advanced, and found the Moors were only searching for a place to confine them in. At that time Mr Holwell might have made his escape, by the assistance of Mr Leech, the company's smith, who had escaped when the Moors entered the fort, and returned just as it was dark, to tell Mr Holwell he had provided a boat, and would insure his escape, if he would follow him through a passage few were acquainted with, and by which he then entered. This might easily have been accomplished, as the guard took little notice of it: but Mr Holwell told Mr Leech, he was resolved to share the fate of the gentlemen and the garrison; to which Mr Leech gallantly replied, that "then he was resolved to share Mr Holwell's fate, and would not leave him."

The guard on the parade advanced, and ordered them all to rise and go into the barracks. Then, with their muskets presented, they ordered them to go into the black-hole prison; while others, with clubs and scymitars, pressed upon them so strong, that there was no resisting it; but, like one agitated wave impelling another, they were obliged to give way and enter; the rest following like a torrent. Few among them, the soldiers excepted, had the least idea of the dimensions or nature of a place they had never seen; for if they had, they should at all events have rushed upon the guard, and been cut to pieces by their own choice as the lesser evil.

It was about eight o'clock when these 146 unhappy persons, exhausted by continual action and fatigue, were thus crammed together into a dungeon about eighteen feet square, in a close sultry night in Bengal; shut up to the east and south, the only quarters from whence air could reach them, by dead walls, and by a wall and door to the north; open only to the west by two windows, strongly barred with iron, from which they could receive scarce any circulation of fresh air.

They had been but few minutes confined before every one fell into a perspiration so profuse, that no idea can be formed of it. This brought on a raging thirst, which increased in proportion as the body was drained of its moisture. Various expedients were thought

Calcutta.

Calcutta. thought of to give more room and air. Every man was stripped, and every hat put in motion: they several times sat down on their hams; but at each time several of the poor creatures fell, and were instantly suffocated or trod to death.

Before nine o'clock every man's thirst grew intolerable, and respiration difficult. Efforts were again made to force the door; but still in vain. Many insults were used to the guards, to provoke them to fire in upon the prisoners, who grew outrageous, and many delirious. "Water, water," became the general cry. Some water was brought; but these supplies, like sprinkling water on fire, only served to raise and feed the flames. The confusion became general, and horrid from the cries and ravings for water; and some were trampled to death. This scene of misery proved entertainment to the brutal wretches without, who supplied them with water, that they might have the satisfaction of seeing them fight for it, as they phrased it; and held up lights to the bars, that they might lose no part of the inhuman diversion.

Before eleven o'clock, most of the gentlemen were dead, and one third of the whole. Thirst grew intolerable: but Mr Holwell kept his mouth moist by sucking the perspiration out of his shirt-sleeves, and catching the drops as they fell, like heavy rain, from his head and face. By half an hour after eleven, most of the living were in an outrageous delirium. They found that water heightened their uneasinesses; and "Air, air," was the general cry. Every insult that could be devised against the guard, all the opprobrious names that the viceroy and his officers could be loaded with, were repeated, to provoke the guard to fire upon them. Every man had eager hopes of meeting the first shot. Then a general prayer to heaven, to hasten the approach of the flames to the right and left of them, and put a period to their misery. Some expired on others; while a steam arose as well from the living as the dead, which was very offensive.

About two in the morning, they crowded so much to the windows, that many died standing, unable to fall by the throng and equal pressure round. When the day broke, the stench arising from the dead bodies was unsufferable. At that juncture, the Soubah, who had received an account of the havoc death had made among them, sent one of his officers to enquire if the chief survived. Mr Holwell was shown to him; and near six an order came for their release.

Thus they had remained in this infernal prison from eight at night until six in the morning, when the poor remains of 146 souls, being only 23, came out alive; but most of them in a high putrid fever. The dead bodies were dragged out of the hole by the soldiers, and thrown promiscuously into the ditch of an unfinished ravelin, which was afterwards filled with earth.

The injuries which Calcutta suffered at this time, however, were soon repaired. The place was retaken by Admiral Watson and Colonel Clive, early in 1757; Surajah Dowle was defeated, deposed, and put to death; and Meer Jaffier, who succeeded him in the Nabobship, engaged to pay an immense sum for the indemnification of the inhabitants. Since that time the immense acquisition of territory by the Bri-

tish in this part of the world, with the constant state of security enjoyed by this city, have given an opportunity of embellishing and improving it greatly beyond what it was before.—Among these improvements we may reckon that of Sir William Jones; who, on the 15th of January 1784, instituted a society for inquiring into the history civil and natural, the antiquities, arts, sciences, and literature of Asia; and thus the literature of Europe, and along with it, it is to be hoped, the arts of humanity, beneficence, and peace, have at length obtained a footing in the rich empire of Indostan, so long a prey to the rapine and violence of tyrants and usurpers.

CALDARIUM, in the ancient baths, denoted a brazen vessel or cistern, placed in the hypocaustum, full of hot water, to be drawn thence into the *piscina* or bath, to give it the necessary degree of heat. In this sense, the *caldarium* stood contradistinguished from the *tepidarium* and *frigidarium*.

CALDARIUM also denoted the stove, or sudatory, being a close vaulted room, wherein by hot dry fumes, without water, people were brought to a profuse sweat. In which sense, *caldarium* was the same with what was otherwise denominated *vaporarium*, *sudatorium*, and *laconium*; in the Greek baths, *hypocaustum*, *υποκαυστον*.

CALDERINUS (Domitius), a learned critic, born at Calderia near Verona. He read lectures upon polite literature at Rome with great reputation; and was the first who ventured to write upon the most difficult of the ancient poets. He died very young in 1477.

CALDERON, De la Barca, (Dom. Pedro), a Spanish officer, who, after having signalized himself in the military profession, quitted it for the ecclesiastical, and then commenced dramatic writer. His dramatic works make 9 vols in 4to, and some Spanish authors have compared him to Shakespeare. He flourished about the year 1640.

CALDERWOOD (David), a famous divine of the church of Scotland, and a distinguished writer in behalf of the Presbyterians, was descended of a good family in that kingdom; and being early designed for the ministry, he applied with great diligence to the study of the Scriptures in their original tongues, the works of the fathers, the councils, and the best writers on church-history. He was settled about the year 1604 at Crelling near Jedburgh. King James I. of Great Britain, being desirous of bringing the church of Scotland nearer to a conformity with that of England, laboured earnestly to restore the episcopal authority, and enlarge the powers of the bishops who were then in Scotland. This design was very warmly opposed by many of the ministers, and particularly by Mr David Calderwood; who, when Mr James Law, bishop of Orkney, came to visit the presbyteries of Merse and Teviotdale, declined his jurisdiction by a paper under his hand dated May 5th 1608. But the king having its success much at heart, sent the earl of Dunbar, then high-treasurer of Scotland, with Dr Abbot afterwards archbishop of Canterbury, and two other divines, into that kingdom, with instructions to employ every method to persuade both the clergy and laity of his majesty's sincere desire to promote the good of the church, and of his zeal for the Protestant religion. Mr Calderwood did not assist at the general assembly held at Glasgow June 8th 1610, in which lord Dun-

Calder-
wood.

bar presided as commissioner; and it appears from his writings, that he looked upon every thing transacted in it as null and void. In May following, king James went to Scotland; and on the 17th of June held a parliament at Edinburgh: at that time the clergy met in one of the churches, to hear and advise with the bishops; which kind of assembly, it seems, was contrived in order to resemble the English convocation. Mr Calderwood was present at it, but declared publicly that he did not take any such meetings to resemble a convocation; and being opposed by Dr Whitford and Dr Hamilton, who were friends to the bishops, he took his leave of them in these words: "It is absurd to see men sitting in silks and fattins, and to cry poverty in the kirk, when purity is departing." The parliament proceeded in the mean while in the dispatch of business; and Mr Calderwood, with several other ministers, being informed that a bill was depending to empower the king, with the advice of the archbishops, bishops, and such a number of the ministry as his Majesty should think proper, to consider and conclude as to matters decent for the external policy of the church, not repugnant to the word of God; and that such conclusions should have the strength and power of ecclesiastical laws: against this they protested, for four reasons. 1. Because their church was so perfect, that, instead of needing reformation, it might be a pattern to others. 2. General assemblies, as now established by law, and which ought always to continue, might by this means be overthrown. 3. Because it might be a means of creating schism, and disturb the tranquillity of the church. 4. Because they had received assurances, that no attempts should be made to bring them to a conformity with the church of England. They desired therefore, that, for these and other reasons, all thoughts of passing such a law might be laid aside: but in case this be not done, they protest for themselves and their brethren who shall adhere to them, that they can yield no obedience to this law when it shall be enacted, because it is destructive of the liberty of the church; and therefore shall submit to such penalties, and think themselves obliged to undergo such punishments, as may be inflicted on them for disobeying that law. This protest was signed by Mr Archibald Simson on behalf of the members who subscribed another separate roll, which he kept for his justification. This protest was presented to the clerk register, who refused to read it before the states in parliament. However, though not read, it had its effect; for although the bill had the consent of parliament, yet the king thought fit to cause it to be laid aside, and not long after called a general assembly at St Andrew's. Soon after the parliament was dissolved, and Mr Calderwood was summoned to appear before the high-commission court at St Andrew's, on the 8th of July following, to answer for his mutinous and seditious behaviour. July 10th, the king came to that city in person; when Mr Calderwood, being called upon, and refusing to comply with what the king in person required of him, was committed to prison. Afterwards the privy council, according to the power exercised by them at that time, directed him to banish himself out of the king's dominions before Michaelmas next; and not to return without licence. Having applied to the king for a prorogation of his sentence without success, because he would neither acknowledge

his offence, nor promise conformity for the future, he retired to Holland, where, in 1623, he published his celebrated piece entitled *Altare Damascenum*. Mr Calderwood having in the year 1624 been afflicted with a long fit of sickness, and nothing having been heard of him for some time, one Mr Patrick Scot, as Calderwood himself informs us, took it for granted that he was dead; and thereupon wrote a recantation in his name, as if, before his decease, he had changed his sentiments. This imposture being detected, Scot went over to Holland, and staid three weeks at Amsterdam, where he made a diligent search for the author of *Altare Damascenum*, with a design to have dispatched him. But Calderwood had privately retired into his own country, where he lived several years. Scot gave out that the king had furnished him with the matter for the pretended recantation, and that he only put it in order. During his retirement, Mr Calderwood collected all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the reformation there down to the death of king James; which collection is still preserved in the university library of Glasgow; that which was published under the title of "The true history of Scotland," is only an extract from it. In the advertisement prefixed to the last edition of his *Altare Damascenum* mention is made of his being minister of Pencaitland near Edinburgh in 1638; but we find nothing said there, or any where else, of his death.

CALDRON, a large kitchen utensil, commonly made of copper; having a moveable iron handle, whereby to hang it on the chimney-hook. The word is formed from the French *chaudron*, or rather the Latin *caldarium*.

Boiling in CALDRONS, (*caldarii decoquere*), is a capital punishment spoken of in the middle-age writers, decreed to divers sorts of criminals, but chiefly to debasers of the coin. One of the torments inflicted on the ancient Christian martyrs, was boiling in caldrons of water, oil, &c.

CALDWALL (Richard), a learned English physician, born in Staffordshire about the year 1513. He studied physic in Brazen-Nose college Oxford; and was examined, admitted unto, and made censor of, the college of physicians at London, all in one day. Six weeks after he was chosen one of the elects; and in the year 1570, was made president of that college. Mr Wood tells us, that he wrote several pieces in his profession; but he does not tell us what they were, only that he translated a book on the art of surgery, written by one Horatio More, a Florentine physician. We learn from Cambden, that Caldwell founded a chirurgical lecture in the college of physicians, and endowed it with a handsome salary. He died in 1585.

CALEA, in botany: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is paleaceous, the pappus hairy, and the calyx imbricated.

CALEB, one of the deputies sent by the Israelites to take a view of the land of Canaan. He made a good report of the country, and by this means revived the spirits of the dejected people; on which account, he and Joshua were the only persons who, after their leaving Egypt, settled in the land of Canaan. Caleb had,

Caldron
||
Caleb.

Caledonia. had, for his share, the mountains and the city of Hebron, from which he drove three kings. Othniel his nephew having taken the city of Debir, Caleb gave him his daughter Achsah in marriage; and died, aged 114.

CALEDONIA, the ancient name of Scotland. From the testimonies of Tacitus, Dio, and Solinus, we find, that the ancient Caledonia comprehended all that country lying to the north of the rivers Forth and Clyde. In proportion as the Silures or Cimbri advanced towards the north, the Caledonians, being circumscribed within narrower limits, were forced to transmigrate into the islands which crowd the western coasts of Scotland. It is in this period, probably, we ought to place the first great migration of the British Gaël into Ireland; that kingdom being much nearer to the promontory of Galloway and Cantire, than many of the Scottish isles are to the continent of North Britain.

To the country which the Caledonians possessed, they gave the name of *Gaël-doch*; which is the only appellation the Scots, who speak the Gaelic language, know for their own division of Britain. *Gaël-doch* is a compound, made up of *Gaël* or *Caël*, the first colony of the ancient Gauls who transmigrated into Britain, and *doch*, a district or division of a country. The Romans, by transposing the letter *l* in *Caël*, and by softening into a Latin termination the *ch* of *doch*, formed the well known name of Caledonia.

When the tribes of North Britain were attacked by the Romans, they entered into associations, that, by uniting their strength, they might be more able to repel the common enemy. The particular name of that tribe, which either its superior power or military reputation placed at the head of the association, was the general name given by the Romans to all the confederates. Hence it is that the *Maata*, who with other tribes inhabited the districts of Scotland lying southward of the frith, and the *Caledonians*, who inhabited the west and north-west parts, have engrossed all the glory which belonged in common, though in an inferior degree, to all the other nations settled of old in North Britain. It was for the same reason that the name of *Maata* was entirely forgotten by foreign writers after the third century, and that of the *Caledonians* themselves but seldom mentioned after the fourth.

Britons, *Caledonians*, *Maata*, *Barbarians*, are the names constantly given to the old inhabitants of North Britain, by Tacitus, Herodian, Dio, Spartian, Vopiscus, and other ancient writers. The successors of these Britons, Caledonians, *Maata*s, and Barbarians, are called Picts, Scots, and Attacots, by some Roman writers of the fourth century.

The origin of the appellation *Scoti* and *Pi&ti*, introduced by latter Roman authors, has occasioned much controversy among the antiquarians of these days. The dispute seems now to be fully decided by some learned critics of the present century, whose knowledge of the Gaelic language assisted their investigation. See SCOTLAND, PICTS, and HIGHLANDERS.

CALEDONIA, the name of a settlement made by the Scots on the west side of the gulph of Darien, in 1698; out of which they were starved at the request of the East-India company: for the English government pro-

hibited the other colonies sending them any provisions; so they were obliged to leave it in 1700.

NEW CALEDONIA, an island in the south-sea, lately discovered by captain Cook, and, next to New Holland and New Zealand, is the largest island that hath yet been discovered in that sea. It extends from 19. 37. to 22. 30. S. Lat. and from 163. 37. to 167. 14. E. Long. Its length from north-west to south-east is about 80 leagues; but its greatest breadth does not exceed ten leagues. This island is diversified by hills and valleys of various size and extent. From the hills issue abundance of rivulets, which contribute to fertilize the plains. Along its north-east shore the land is flat; and being well watered, and cultivated by the inhabitants after their manner, appeared to great advantage to captain Cook's people. Was it not, indeed, for those fertile spots on the plains, the whole country might be called a dreary waste: the mountains and higher parts of the land are in general incapable of cultivation. They consist chiefly of rocks, many of which are full of mundic; the little soil that is upon them is scorched and burnt up by the sun; it is, however, covered with coarse grass and other plants, and here and there covered with trees and shrubs. The country in general bears a great resemblance to those parts of New South Wales which lie under the same parallel of latitude. Several of its natural productions are the same, and the woods are without underwood as well as in that country. The whole coast seems to be surrounded by reefs and shoals, which render all access to it extremely dangerous; but at the same time guard the coasts against the attacks of the wind and sea; rendering it easily navigable along the coast by canoes, and causing it abound with fish. Every part of the coast seems to be inhabited; the plantations in the plains are laid out with great judgment, and cultivated with much labour. They begin their cultivation by setting fire to the grass, &c. with which the ground is covered, but have no notion of preserving its vigour by manure; they, however, recruit it by letting it lie for some years untouched. On the beach was found a large irregular mass of rock, not less than a cube of ten feet, consisting of a close-grained stone speckled full of granates somewhat bigger than pins heads, from whence it seems probable that some valuable minerals may be found on this island. It differs from all the other islands yet discovered in the South Sea, by being entirely destitute of volcanic productions. Several plants of a new species were found here; and a few young breadfruit trees, not then sufficiently grown to bear fruit, seemed to have come up without culture: plantains and sugar-canes are here in small-quantity, and the cocoa-nut trees are small and thinly planted. A new species of passion-flower was likewise met with, which was never known to grow wild any where but in America. Several *Caputi* (*MELALEUCA*) trees were also found in flower. Musketos here are very numerous. A great variety of birds were seen of different classes, which were for the most part entirely new; particularly a beautiful species of parrot before unknown to zoologists. A new species of fish, of the genus called by Linnæus *tetraodon*, was caught here; and its liver, which was very large, presented at supper. Several species of this genus being reckoned poisonous, and the present species being remarkably

Caledonia. remarkably ugly, Mess. Forsters hinted their suspicions of its quality; but the temptation of a fresh meal, and the assurances of captain Cook that he had formerly eaten this identical sort of fish without harm, got the better of their scruples, and they eat of it. Its oiliness, however, though it had no other bad taste than what proceeded from this, prevented them from taking more than a morsel or two. In a few hours after they had retired to rest, they were awakened by very alarming symptoms, being all seized with an extreme giddiness; their hands and feet were numbed, so that they were scarcely able to crawl; and a violent languor and oppression seized them. Emetics were administered with some success, but sudorifics gave the greatest relief. Some dogs who had eaten the remainder of the liver were likewise taken ill; and a pig which had eaten the entrails died soon after, having swelled to an unusual size. The effects of this poison on the gentlemen did not go entirely off in less than six weeks.—Abundance of turtle was seen here. The natives had not the least notion of goats, hogs, dogs, or cats, and had not even a name for any of them.

The inhabitants are very stout, tall, and in general well proportioned; their features mild; their beards and hair black, and strongly frizzled, so as to be somewhat woolly in some individuals: their colour is swarthy, or a dark chestnut brown. A few were seen who measured six feet four inches. They are remarkably courteous, not at all addicted to pilfering and stealing; in which character of honesty they are singular, all the other nations in the South Sea being remarkably thievish. Some wear their hair long, and tie it up to the crown of their heads; others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it cropt short. They make use of a kind of comb made of sticks of hard wood, from seven to nine or ten inches long, and about the thickness of knitting needles; a number of these, seldom exceeding 20, but generally fewer, are fastened together at one end, parallel to and near one tenth of an inch from each other; the ends, which are a little pointed, will spread out or open like the sticks of a fan. These combs they always wear in their hair on one side of their head. Some had a kind of concave cylindrical stiff black cap, which appeared to be a great ornament among them, and was supposed to be worn only by the chiefs and warriors. A large sheet of strong paper, whenever they got one in exchange, was commonly applied to this purpose. The men go naked; only tying a string round their middle, and another round their neck. A little piece of a brown cloth made of the bark of a fig-tree, sometimes tucked up to the belt, and sometimes pendulous, scarcely deserves the name of a covering; nor indeed does it seem at all intended for that purpose. This piece of cloth is sometimes of such a length, that the extremity is fastened to the string round the neck; to this string they likewise hang small round beads of a pale green nephritic stone. Coarse garments were seen among them made of a sort of matting; but they seemed never to wear them, except when in their canoes and unemployed. The women seemed to be in a servile state: they were the only persons of the family who had any employment, and several of them brought bundles of sticks and fuel on their back: those who

had children carried them on their backs in a kind of fatchel. The women also were seen to dig up the earth in order to plant it. They are in general of a dark chestnut, and sometimes mahogany brown; their stature middle-sized, some being rather tall, and their whole form rather stout, and somewhat clumsy. Their dress is the most disfiguring that can be imagined, and gives them a thick squat shape; it is a short petticoat or fringe, consisting of filaments or little cords, about eight inches long, which are fastened to a very long string, which they have tied several times round their waist. The filaments, or little ropes, therefore, lie above each other in several layers, forming a kind of thick thatch all round the body, but which does not near cover the thigh: these filaments were sometimes dyed black; but frequently those on the outside only were of that colour, the rest being of a dirty grey. There was not a single instance, during the ship's stay in this island, of the women permitting any indecent familiarity with an European: they took pleasure in practising the arts of a jilting coquette, but never became absolute wantons. The general ornaments of both sexes are ear-rings of tortoise shells; necklaces, or amulets, made both of shells and stones; and bracelets made of large shells, which they wear above the elbows.

The houses, or huts, in New Caledonia, are circular, something like a bee-hive, and full as close and warm; the entrance is by a small door, or long square hole, just big enough to admit a man bent double: the side-walls are about four feet and a half high; but the roof is lofty, and peaked to a point at the top, above which is a post or stick of wood, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, &c. and both sides and roof are thick, and close covered with thatch made of coarse long grass. In the inside of the house are set up posts, to which cross spars are fastened, and platforms made, for the convenience of laying any thing on. Some houses have two floors, one above another; the floor is laid with dried grass, and here and there mats are spread for the principal people to sit or sleep on. In these houses there was no passage for the smoke but through the door; they were intolerably smoky, and so hot as to be insupportable to those unaccustomed to them: probably the smoke is intended to drive out the musketos which swarm here. They commonly erect two or three of these huts near each other under a cluster of lofty fig-trees, whose leaves are impervious to the rays of the sun.

The canoes used here are very heavy clumsy vessels; they are made of two trees hollowed out, having a raised gunnel about two inches high, and closed at each end with a bulk head of the same height; so that the whole is like a long square trough about three feet shorter than the body of the canoe. Two canoes thus fitted are fastened to each other about three feet asunder, by means of cross-spars, which project about a foot over each side. Over these is laid a deck or heavy platform made of plank and small round spars, on which they have a fire-hearth, and generally a fire burning; they are navigated by one or two latteen sails, extended to a small latteen yard, the end of which is fixed in a notch or hole in the deck.

Notwithstanding the inoffensive disposition of the inhabitants of New Caledonia, they are well provided with

Caledonia
||
Calenberg.

with offensive weapons; as clubs, spears, darts, and slings for throwing stones. Their clubs are about two feet and an half long, and variously formed; some like a scythe, others like a pick-ax; some have a head like a hawk, and others have round heads; but all are neatly made; many of their darts and spears are no less neat, and ornamented with carvings. The slings are as simple as possible; but they take some pains to form the stones that they use into a proper shape, which is something like an egg, supposing both ends to be like the small one. They drive the dart by the assistance of short cords knobbed at one end and looped at the other, called by the seamen *beckets*. These contain a quantity of red wool taken from the vampire, or great Indian bat. Bows and arrows are wholly unknown among them.

Their language bears no affinity to that spoken in the other South-sea islands, the word *arrekee* and one or two more excepted. This is the more extraordinary, as different dialects of one language were spoken not only in the easterly islands, but at New Zealand.

A musical instrument, a kind of whistle, was procured here. It was a little polished piece of brown wood about two inches long, shaped like a kind of bell, tho' apparently solid, with a rope fixed at the small end; two holes were made in it near the base, and another near the insertion of the rope, all which communicated with each other; and by blowing in the uppermost, a shrill sound like whistling was produced: no other instrument was seen among them that had the least relation to music.

Many of the New Caledonians were seen with prodigiously thick legs and arms, which seemed to be affected with a kind of leprosy; the swelling was found to be extremely hard, but the skin was not alike harsh and scaly in all those who were afflicted with the disorder. The preternatural expansion of the arm or leg did not appear to be a great inconvenience to those who suffered it; and they seemed to intimate that they very rarely felt any pain in it; but in some the disorder began to form blotches, which are marks of a great degree of virulence.

Here they bury their dead in the ground. The grave of a chief who had been slain in battle here resembled a large mole-hill, and was decorated with spears, darts, paddles, &c. all stuck upright in the ground round about it. Lieutenant Pickersgill was showed a chief whom they named *Tea-booma*, and styled their *arrekee* or *king*; but nothing further is known of their government, and nothing at all of their religion.

CALEFACTION, the production of heat in a body from the action of fire, or that impulse impressed by a hot body on others around it. This word is used in pharmacy, by way of distinction from *cotion*, which implies boiling; whereas calefaction is only heating a thing.

CALEMBERG, a castle of Germany, in the duchy of Brunswic and principality of Calenberg. It is seated on the river Leine, and is 15 miles south of Hanover. It is subject to the duke of Brunswic Lunenburg, elector of Hanover, and king of Great Britain. E. Long. 9. 43. N. Lat. 52. 20.

CALEMBERG, a principality of Lower Saxony, and

one of the three parts of the duchy of Brunswic, is bounded on the north by the duchy of Verden, on the east by the principality of Zell, on the south by the principalities of Grubenhagen and Wolfenbüttele, and on the west by Westphalia. It belongs to the elector of Hanover.

CALENDAR, in astronomy and chronology. See **KALENDAR**.

CALENDAR of prisoners, in law, a list of all the prisoners names in the custody of each respective sheriff*. * See the **CALENDARIUM FLORÆ**, in botany, a calendar article *See* containing an exact register of the respective times in *ecution* which the plants of any given province or climate germinate, expand, and shed their leaves and flowers, or ripen and disperse their seeds. For particulars on this curious subject, see the articles **DEFOLIATIO**, **EFFLORESCENTIA**, **FRONDESCENTIA**, **FRUCTESCENTIA**, and **GERMINATIO**.

CALENDER, a machine used in manufactories to press certain woollen and filken stuffs and linens, to make them smooth, even, and glossy, or to give them waves, or water them, as may be seen in Mohairs and tabbies. This instrument is composed of two thick cylinders or rollers, of very hard and well polished wood, round which the stuffs to be calendered are wound: these rollers are placed cross-wise between two very thick boards, the lower serving as a fixed base, and the upper moveable by means of a thick screw with a rope fastened to a spindle which makes its axis: the uppermost board is loaded with large stones weighing 20,000lb. or more. At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert. The lower table or plank is made of a block of smooth marble, and the upper is lined with a plate of polished copper.—The alternate motion of the upper board sometimes one way and sometimes another, together with the prodigious weight laid upon it, gives the stuffs their gloss and smoothness; or gives them the waves, by making the cylinders on which they are put roll with great force over the undermost board. When they would put a roller from under the calender, they only incline the undermost board of the machine. The dressing alone, with the many turns they make the stuffs and linens undergo in the calender, gives the waves, or waters them, as the workmen call it. It is a mistake to think, as some have asserted, and Mr Chambers among others, that they use rollers with a shallow indenture or engraving cut into them.

CALENDER OF MONTEITH, a district in the south-west corner of Perthshire in Scotland, from which a branch of the ancient family of Livingston had the title of Earl. The chief seat of the family near Falkirk is also called *Calender*. Both estate and title were forfeited for being engaged in the rebellion 1715.

CALENDERS, a sort of Mahometan friars, so called from Santon Calenderi their founder. This Santon went bare-headed, without a shirt, and with the skin of a wild beast thrown over his shoulders. He wore a kind of apron before, the strings of which were adorned with counterfeit precious stones. His disciples are rather a sect of Epicureans than a society of religious. They honour a tavern as much as they do a mosque; and think they pay as acceptable worship to God by the

Calenders.

Calends
||
Calenture.

the free use of his creatures, as others do by the greatest austerities and acts of devotion. They are called, in Persia and Arabia, *Abdals*, or *Abdallat*, i. e. persons consecrated to the honour and service of God. Their garment is a single coat, made up of a variety of pieces, and quilted like a rug. They preach in the market-places, and live upon what their auditors bestow on them. They are generally very vicious persons; for which reason they are not admitted into any houses.

CALENDS, in Roman antiquity. See KALENDS.

CALENDULA, the MARIGOLD: A genus of the polygamia necessaria order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositae*. The receptacle is naked, there is no pappus, the calyx is polyphyllous and equal, the seeds of the disk membranaceous. Of this there are eight species, none of them natives of Europe. The common kind is so well known as to need no definition; and none of the others merit any, except the fruticosa, which hath lately been introduced from the Cape of Good Hope. It hath a slender shrubby perennial stalk, which rises to the height of seven or eight feet, but requires support: this sends out a great number of weak branches from the bottom to the top, which hang downward unless they are supported: they are garnished with oval leaves, having short flat footstalks; these are of a shining green colour on their upper side, but paler underneath: the flowers come out at the end of the branches, on short naked footstalks. This is easily propagated by cuttings; which may be planted at any time in summer in a shady border, or otherwise shaded with mats in the heat of the day: in five or six weeks these will have taken root, when they should be separately taken up, each put in a separate pot, and placed in the shade till they have taken fresh root; then they may be placed, with other hardy exotic plants, in a sheltered situation, where they may remain till the frost begins, when they must be removed into the green-house, placing them near the windows, that they may enjoy the free air; for this plant only requires protection from frost. The seeds of the common sort may be sown in March or April, where the plants are to remain; and will require no other culture but to keep them clear of weeds, and to thin the plants where they are too thick. The flowers of the common marigold are supposed to be aperient and attenuating, as also cardiac, alexipharmac, and sudorific; they are principally celebrated in uterine obstructions, the jaundice, and for throwing out the small-pox. Their sensible qualities, however, give little foundation for these virtues: they have scarce any taste, and have no considerable smell. The leaves of the plant discover a viscid sweetishness, accompanied with a more durable saponaceous pungency and warmth; these seem capable of answering some useful purposes as a stimulating, aperient, and antiscorbutic medicine.

CALENTIUS (Elisius), a Neapolitan poet and prose author. He was preceptor to Frederic the son of Ferdinand king of Naples, and the earliest writer on the illegality of putting criminals to death, except for murder. He died in 1503.

CALENTURE, a feverish disorder incident to sailors in hot countries; the principal symptom of which is their imagining the sea to be green fields: thence, attempting to walk abroad in these imaginary

places of delight, they are frequently lost. Vomiting, bleeding, a spare diet, and the neutral salts, are recommended in this disorder; a single vomit commonly removing the delirium, and the cooling medicines completing the cure.

CALEPIN (Ambrosius), an Augustin monk of Calapio, whence he took his name, in the 16th century. He is author of a dictionary of eight languages, since augmented by Passerat and others.

CALES (anc. geog.), a municipal city of some note in Campania, at no great distance from Casilinum. The epithet *Calenus* is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES (anc. geog.), a people of Gallia Celtica, on the confines of Belgica, situated between the sea and the Sequana. Now called *le Pais de Caux*, in Normandy.

CALETURE, a fort on the island of Ceylon, at the mouth of a river of the same name. The Dutch became masters of it in 1655; but were afterwards obliged to leave it. E. Long. 80. 51. N. Lat. 6. 38.

CALF, in zoology, the young of the ox kind.

There are two ways of breeding calves that are intended to be reared. The one is to let the calf run about with its dam all the year round; which is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other is to take them from the dam after they have sucked about a fortnight: they are then to be taught to drink flat milk, which is to be made but just warm for them, it being very dangerous to give it them too hot. The best time of weaning calves is from January to May: they should have milk for 12 weeks after; and a fortnight before that is left off, water should be mixed with the milk in larger and larger quantities. When the calf has been fed on milk for about a month, little whisks of hay should be placed all about him in cleft sticks to induce him to eat. In the beginning of April they should be turned out to graze; only for a few days they should be taken in for the night, and have milk and water given them: the same may also be given them in a pail sometimes in the field, till they are so able to feed themselves that they do not regard it. The graze they are turned into must not be too rank, but short and sweet, that they may like it, and yet get it with some labour. Calves should always be weaned at graze; for if it be done with hay and water, they often grow big-belly'd on it, and are apt to rot. When those among the males are selected which are to be kept as bulls, the rest should be gelt for oxen: the sooner the better. Between 10 and 20 days is a proper age. About London almost all the calves are fatted for the butcher. The reason of this is, that there is a good market for them; and the lands there are not so profitable to breed upon as in cheaper countries. The way to make calves fat and fine is, the keeping them very clean; giving them fresh litter every day; and the hanging a large chalk-stone in some corner where they can easily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The coops are to be placed so as not to have too much sun upon them, and so high above the ground that the urine may run off. They also bleed them once when they are a month old, and a second time before they kill

Calapia
||
Calf.

Calf. kill them; which is a great addition to the beauty and whiteness of their flesh: the bleeding is by some repeated much oftener, but this is sufficient. Calves are very apt to be loose in their bowels; which wastes and very much injures them. The remedy is to give them chalk scraped among milk, pouring it down with a horn. If this does not succeed, they give them bole armenic in large doses, and use the cold bath every morning. If a cow will not let a strange calf suck her, the common method is to rub both her nose and the calf's with a little brandy; this generally reconciles them after a few smellings.

Golden CALF, an idol set up and worshipped by the Israelites at the foot of Mount Sinai in their passage through the wilderness to the land of Canaan. Our version makes Aaron fashion this calf with a graving tool after he had cast it in a mould: the Geneva translation makes him engrave it first, and cast it afterwards. Others, with more probability, render the whole verse thus: "And Aaron received them (the golden earrings), and tied them up in a bag, and got them cast into a molten calf;" which version is authorized by the different senses of the word *tsur*, which signifies to tie up or bind, as well as to shape or form; and of the word *cherret*, which is used both for a graving tool and a bag. Some of the ancient fathers have been of opinion that this idol had only the face of a calf, and the shape of a man from the neck downwards, in imitation of the Egyptian Isis. Others have thought it was only the head of an ox without a body. But the most general opinion is, that it was an entire calf in imitation of the Apis worshipped by the Egyptians; among whom, no doubt, the Israelites had acquired their propensity to idolatry. This calf Moses is said to have burnt with fire, reduced to powder, and strewed upon the water which the people were to drink. How this could be accomplished hath been a question. Most people have thought, that as gold is indestructible, it could only be burnt by the miraculous power of God; but M. Stahl conjectures that Moses dissolved it by means of liver of sulphur*. The Rabbins tell us that the people were made to drink of this water in order to distinguish the idolaters from the rest; for that as soon as they had drunk of it, the beards of the former turned red. The cabbalists add, that the calf weighed 125 quintals; which they gather from the Hebrew word *massékah*, whose numerical letters make 125.

CALF-Skins, in the leather manufacture, are prepared and dressed by the tanners, skinners, and curriers, who sell them for the use of the shoe-makers, saddlers, bookbinders, and other artificers, who employ them in their several manufactures.

CALF-Skin dressed in sumach, denotes the skin of this animal curried black on the hair side, and dyed of an orange colour on the flesh side, by means of sumach, chiefly used in the making of belts.

The English calf-skin is much valued abroad, and the commerce thereof very considerable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain. What is like to baffle all endeavours for imitating the English calf in France is, the smallness and weakness of the calves about Paris; which at fifteen days old are not so big as the English ones when they come into the world.

Sea-CALF. See PHOCA.

CALI, a town of Popayan in South America, seated in a valley of the same name on the river Cauca. The governor of the province usually resides there. W. Long. 78. 5. N. Lat. 3. 15.

CALIBER, or **CALIPER**, properly denotes the diameter of any body; thus we say, two columns of the same caliber, the caliber of the bore of a gun, the caliber of a bullet, &c.

CALIBER-Compasses, a sort of compasses made with arched legs to take the diameter of round or swelling bodies. See COMPASSES.

Caliber-compasses, are chiefly used by gunners, for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular; and move on an arch of brass, whereon is marked the inches and half inches, to show how far the points of the compasses are opened asunder.

Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use calibers, to embrace the two heads of any cask, in order to find its length.

The calibers used by carpenters and joiners, is a piece of board notched triangular-wise in the middle for the taking of measure.

CALIBER-Rule, or **Gunner's CALLIPERS**, is an instrument wherein a right line is so divided as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, four, &c. pounds are to the diameter of a ball of one pound. The caliber is used by engineers, from the weight of the ball given, to determine its diameter or caliber, or *vice versa*.

The gunner's callipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: its length from the centre of the joint is between six inches and a foot, and its breadth from one to two inches; that of the most convenient size is about nine inches long. Many scales, tables, and proportions, &c. may be introduced on this instrument; but none are essential to it, except those for taking the caliber of shot and cannon, and for measuring the magnitude of salient and entering angles. The most complete callipers is exhibited Plate CXII. the furniture and use of which we shall now briefly describe. Let the four faces of this instrument be distinguished by the letters A, B, C, D: A and D consist of a circular head and leg; B and C consist only of a leg.

On the circular head adjoining to the leg of the face A are divisions denominated *shot diameters*; which show the distance in inches and tenths of an inch of the points of the callipers when they are opened; so that if a ball not exceeding ten inches be introduced between them, the bevil edge E marks its diameter among these divisions.

On the circular bevil part E of the face B is a scale of divisions distinguished by *lb. weight of iron shot*. When the diameter of any shot is taken between the points of the callipers, the inner edge of the leg A shows its weight in avoirdupoise pounds, provided it be lb. $\frac{1}{2}$, 1, $1\frac{1}{2}$, 2, 3, 4, $5\frac{1}{2}$, 6, 8, 9, 12, 16, 18, 24, 26, 32, 36, or 42; the figures nearest the bevil edge answering to the short lines in the scale, and those behind them to the longer strokes. This scale is constructed.

Cali,
Caliber.

* See Chalmers's
miserable
Index.

Calliber. *fructed* on the following geometrical theorem, viz. that the weights of spheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a scale of divisions marked *bore of guns*; for the use of which, the legs of the callipers are slipped across each other, till the steel points touch the concave surface of the gun in its greatest breadth; then the bevil edge F of the face B will cut a division in the scale showing the diameter of the bore in inches and tenths.

Within the scales of *shot* and *bore* diameters on the circular part of A, are divisions marked *pounders*: the inner figures $\frac{1}{2}$, $1\frac{1}{2}$, 3, $5\frac{1}{2}$, 8, 12, 18, 26, 36, correspond to the longest lines; and the figures 1, 2, 4, 6, 9, 16, 24, 32, 42, to the short strokes. When the bore of a gun is taken between the points of the callipers, the bevil edge F will either cut or be near one of these divisions, and show the weight of iron-shot proper for that gun.

On the upper half of the circular head of the face A are three concentric scales of degrees; the outer scale consisting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer scale beginning at the middle with 0, and numbered on each side to 90 degrees. These scales serve to take the quantity of an angle, either entering or saliant. For an entering or internal angle, apply the legs of the callipers so that its outward edges coincide with the legs of the given angle, the degree cut by the bevil edge F in the outer scale shows the measure of the angle sought: for a saliant or external angle, flip the legs of the callipers across each other, so that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle scale by the bevil edge E will show the measure of the angle required. The inner scale will serve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the notch on the plate B, and any weight tied to the other end: apply the straight side of the plate A to the side of the body whose inclination is sought; hold it in this position, and move the plate B, till the thread falls upon the line near the centre marked *Perp.* Then will the bevil edge F cut the degrees on the inner scale, showing the inclination of that body to the horizon.

On the face C near the point of the callipers is a little table showing the proportion of troy and avoirdupoise weights, by which one kind of weight may be easily reduced into another.

Near the extreme of the face D of the callipers are two tables showing the proportion between the pounds weight of London and Paris, and also between the lengths of the foot measure of England and France.

Near the extreme on the face A is a table containing four rules of the circle and sphere; and geometrical figures with numbers annexed to them: the first is a circle including the proportion in round numbers of the diameter to its circumference; the second is a circle inscribed in a square, and a square within that circle, and another circle in the inner square: the numbers 28, 22, above this figure exhibit the proportion of the outward square to the area of the inscribed circle; and the numbers 14, 11, below it show the proportion between the area of the inscribed square and the area of its inscribed circle. The third is a cube inscribed in a

N^o 61.

sphere; and the number 89 $\frac{1}{2}$ shows that a cube of iron, inscribed in a sphere of 12 inches in diameter, weighs 89 $\frac{1}{2}$. The fourth is a sphere in a cube, and the number 243 expresses the weight in pounds of a sphere inscribed in a cube whose side is 12 inches: the fifth represents a cylinder and cone of one foot diameter and height: the number in the cylinder shows, that an iron cylinder of that diameter and height weighs 364.5 lb. and the number 121.5 in the cone expresses the weight of a cone, the diameter of whose base is 12 inches, and of the same height: the sixth figure shows that an iron cube, whose side is 12 inches, weighs 464 lb. and that a square pyramid of iron, whose base is a square foot and height 12 inches, weighs 154 $\frac{1}{2}$ lb. The numbers which have been hitherto fixed to the four last figures were not strictly true; and therefore they have been corrected in the figure here referred to; and by these the figures on any instrument of this kind should be corrected likewise.

On the leg B of the callipers, is a table showing the weights of a cubic inch or foot of various bodies in pounds avoirdupoise.

On the face D of the circular head of the callipers is a table contained between five concentric segments of rings: the inner one marked *Guns* shows the nature of the gun or the weight of ball it carries; the two next rings contain the quantity of powder used for proof and service to brass guns, and the two outermost rings show the quantity for proof and service in iron cannon.

On the face A is a table exhibiting the method of computing the *number of shot or shells* in a triangular, square, or rectangular pile. Near this is placed a table containing the principal rules relative to the *fall of bodies*, expressed in an algebraic manner: nearer the centre we have another table of rules for raising water, calculated on the supposition, that one horse is equal in this kind of labour to five men, and that one man will raise a hogshead of water to eight feet of height in one minute, and work at that rate for some hours. N. B. Hogsheads are reckoned at sixty gallons.

Some of the leading principles in gunnery, relating to *shooting* in cannon and mortars, are expressed on the face B of the callipers. Besides the articles already enumerated, the scales usually marked on the sector are laid down on this instrument: thus, the line of inches is placed on the edge of the callipers, or on the straight borders of the faces C, D: the logarithmic scales of numbers, sines, versed sines, and tangents, are placed along these faces near the straight edges: the line of lines is placed on the same faces in an angular position, and marked *Lin.* The lines of plains or superficies are also exhibited on the faces C and D, tending towards the centre, and marked *Plan.* Finally, the lines of solids are laid on the same faces tending towards the centre, and distinguished by *Sol.*

CALICOULAN, or QUILLON, a town of Asia, in the East Indies, on the coast of Malabar, and in the peninsula on this side the Ganges, where the Dutch have a factory. E. Long. 75. 21. N. Lat. 9. 5.

CALICUT, a kingdom of India, on this side the Ganges, upon the coast of Malabar. It is about 63 miles long, and as much broad. It has many woods, rivers, and marshes, and is very populous; but does not produce much corn, abundance of rice being imported

Calicut
||
California.

ported from Canara. The land along the sea-coast is low and sandy, and produces a number of cocoa-trees. The higher grounds produce pepper and cardamoms of a very good quality. They have likewise timber for building, white and yellow sanders, cassia lignea, cassia fistula, nux vomica, and cocculus indicus. The woods abound with parrots and monkeys, as well as different kinds of game. They have also plenty of fish, several sorts of medicinal drugs, and their mountains produce iron. The *samorin*, or king, of Calicut, was once master of all the coast of Malabar; but at his death, he left it by will among four of his nephews. He who governs Calicut has a palace of stone, and there is some appearance of grandeur about his court. He carries on a considerable trade, which makes the people of Calicut richer than their neighbours. In former times they had several strange customs, some of which are still kept up; particularly the *samorin's* wife must be first enjoyed by the high priest, who may have her three nights if he pleases. The nobles permit the other priests to take the same liberty, but the lower people cannot have that honour. A woman may marry a number of husbands; each of whom has her ten days or more by turns, as they agree among themselves; and provides her all things necessary during that time. When she proves with child, she names the father; who, after the child is weaned, takes care of its education. These people have no pens, ink, or paper; but write with a bodkin on flags that grow by the sides of the rivers. By this means the letters are in some sense engraved; and so tough are the flags, that they will last for a great number of years. This was the first land discovered by the Portuguese in 1498.

CALICUT, a town of Asia, in the kingdom of that name on the coast of Malabar. It contains a great number of mean low houses, each of which has a garden. The English had a factory here, but it is removed to Tilicherry. E. Long. 76. 4. N. Lat. 11. 21.

CALIDÆ PLANTÆ (from *calor* heat); plants that are natives of warm climates. Such are those of the East Indies, South America, Egypt, and the Canary Islands. These plants, says Linnæus, will bear a degree of heat which is as 40 on a scale in which the freezing point is 0, and 100 the heat of boiling water. In the 10th degree of cold they cease to grow, lose their leaves, become barren, are suffocated, and perish.

CALIDUCT, in antiquity, a kind of pipes or canal disposed along the walls of houses or apartments, used by the ancients for conveying heat to several remote parts of the house from one common furnace.

CALIFORNIA, the most northerly of all the Spanish dominions on the continent of America, is sometimes distinguished by the name of *New Albion*, and the *Islas Carabiras*: but the most ancient appellation is *California*; a word probably owing to some accident, or to some words spoken by the Indians and misunderstood by the Spaniards. For a long time California was thought to be an island; but Father Caino, a German Jesuit, discovered it to be a peninsula joining to the coast of New Mexico and the southern parts of America. This peninsula extends from Cape St Sebastian, lying in north latitude 43. 30. to Cape St Lucar which lies in north latitude 22. 32. It is divided from New Mexico by the gulph, or as some call it the *lake*, of

VOL. IV. Part I.

California, or *Vermilion Sea*, on the east; on the north, by that part of the continent of North America which is least known; and on the west and south, by the Pacific Ocean or great South Sea. The coasts, especially towards the Vermilion Sea, are covered with inhabited islands, on some of which the Jesuits have established settlements, such as St Clement, Paxaros, St Anne, Cedars (so called from the great number of these trees it produces), St Joseph, and a multitude of others. But the islands best known are three lying off Cape St Lucar, towards the Mexican coast. These are called *Les Tres Marias*, "the three Maries." They are but small, have good wood and water, salt pits, and abundance of game; therefore the English and French pirates have sometimes wintered there, when bound on cruizes in the South Seas.

As California lies altogether within the temperate zone, the natives are neither chilled with cold nor scorched with heat; and indeed the improvements in agriculture made by the Jesuits afford strong proofs of the excellency of the climate. In some places the air is extremely hot and dry; and the earth wild, rugged, and barren. In a country stretching about 800 miles in length, there must be considerable variations of soil and climate; and indeed we find, from good authority, that California produces some of the most beautiful lawns, as well as many of the most inhospitable deserts, in the universe. Upon the whole, although California is rather rough and craggy, we are assured by the Jesuit Vinegas, and other good writers, that with due culture it furnishes every necessary and conveniency of life; and that, even where the atmosphere is hottest, vapours rising from the sea, and dispersed by pleasant breezes, render it of a moderate temperature.

The peninsula of California is now stocked with all sorts of domestic animals known in Spain and Mexico. Horses, mules, asses, oxen, sheep, hogs, goats, and all other quadrupeds imported, thrive and increase in this country. Among the native animals is a species of deer of the size of a young heifer, and greatly resembling it in shape; the head is like that of a deer, and the horns thick and crooked like those of a ram. The hoof of the animal is large, round, and cloven, the skin spotted, but the hair thinner and the tail sharper than those of a deer. Its flesh is greatly esteemed. There is another animal peculiar to this country, larger and more bulky than a sheep, but greatly resembling it in figure, and, like it, covered with a fine black or white wool. The flesh of this animal is nourishing and delicious; and, happily for the natives, it is so abundant, that nothing more is required than the trouble of hunting, as these animals wander about in droves in the forests and on the mountains. Father Torquemado describes a creature which he calls a *species of large bear*, something like a buffalo, of the size of a steer, and nearly of the figure of a stag. Its hair is a quarter of a yard in length, its neck long and awkward, and on its forehead are horns branched like those of a stag. The tail is a yard in length and half a yard in breadth; and the hoofs cloven like those of an ox. With regard to birds, we have but an imperfect account; only, in general, Father Venegas tells us that the coast is plentifully stored with peacocks, bustards, geese, cranes, and most of the birds common in other parts of the world. The quantity of fish which resort to these

F

coasts

California. coasts are incredible. Salmon, turbot, barbel, skate, mackerel, &c. are caught here with very little trouble; together with pearl oysters, common oysters, lobsters, and a variety of exquisite shell-fish. Plenty of turtle are also caught on the coasts. On the South Sea coasts are some shell-fish peculiar to it, and perhaps the most beautiful in the world; their lustre surpassing that of the finest pearl, and darting their rays through a transparent varnish of an elegant vivid blue, like the lapis lazuli. The fame of California for pearls soon drew forth great numbers of adventurers, who searched every part of the gulph, and are still employed in that work, notwithstanding fashion has greatly diminished the value of this elegant natural production. Father Torquimado observes that the sea of California affords very rich pearl fisheries; and that the *hostias*, or beds of oysters, may be seen in three or four fathom water, almost as plain as if they were on the surface.

The extremity of the peninsula towards Cape St Lucar is more level, temperate, and fertile, than the other parts, and consequently more woody. In the more distant parts, even to the farthest missions on the east coast, no large timber hath yet been discovered. A species of manna is found in this country, which, according to the accounts of the Jesuits, has all the sweetness of refined sugar without its whiteness. The natives firmly believe that this juice drops from heaven.

The Californians are well made, and very strong. They are extremely pusillanimous, inconstant, stupid, and even insensible, and seem extremely deserving of the character given to the Indians in general, under the article AMERICA. Before the Europeans penetrated into California, the natives had no form of religion. The missionaries indeed tell us many tales concerning them, but they so evidently bear the marks of forgery as not to be worth repeating. Each nation was then an assemblage of several cottages more or less numerous, that were all mutually confederated by alliances, but without any chief. They were strangers even to filial obedience. No kind of dress was used by the men; but the women made use of some coverings, and were even fond of ornamenting themselves with pearls and such other trinkets as the country afforded. What mostly displayed their ingenuity was the construction of their fishing nets, which are said by the Jesuits to have even exceeded in goodness those made in Europe. They were made by the women, of a coarse kind of flax procured from some plants which grow there. Their houses were built of branches and leaves of trees: nay, many of them were only inclosures of earth and stone, raised half a yard high, without any covering; and even these were so small, that they could not stretch themselves at length in them. In winter, they dwelt under ground in caves either natural or artificial.

In 1526, Ferdinand Cortez having reduced and settled Mexico, attempted the conquest of California; but was obliged to return, without even taking a survey of the country, a report of his death having disposed the Mexicans to a general insurrection. Some other attempts were made by the officers of Cortez, but these were also unsuccessful; and this valuable coast was long neglected by the Spaniards, who, to this day, have but one settlement upon it. In 1595, a galleon

was sent to make discoveries on the Californian shore; but the vessel was unfortunately lost. Seven years after, the count de Monteroy, then viceroy of New Spain, sent Sebastian Biscayno on the same design with two ships and a tender; but he made no discovery of importance. In 1684, the marquis de Laguna, also viceroy of new Spain, dispatched two ships with a tender to make discoveries on the lake of California. He returned with an indifferent account, but was among the first that asserted that California was not an island; which was afterwards confirmed by Father Caino, as already related. In 1697, the Spaniards being discouraged by their losses and disappointments, the Jesuits solicited and obtained permission to undertake the conquest of California. They arrived among the savages with curiosities that might amuse them, corn for their food, and clothes for which they could not but perceive the necessity. The hatred these people bore the Spanish name could not support itself against these demonstrations of benevolence. They testified their acknowledgments as much as their want of sensibility and their inconstancy would permit them. These faults were partly overcome by the religious institutors, who pursued their project with a degree of warmth and resolution peculiar to the society. They made themselves carpenters, masons, weavers, and husbandmen; and by these means succeeded in imparting knowledge, and in some measure a taste for the useful arts, to this savage people, who have been all successively formed into one body. In 1745, they composed 43 villages, separated from each other by the barrenness of the soil and the want of water. The inhabitants of these small villages subsist principally on corn and pulse, which they cultivate; and on the fruits and domestic animals of Europe, the breeding of which last is an object of continual attention. The Indians have each their field, and the property of what they reap; but such is their want of foresight, that they would squander in a day what they had gathered, if the missionary did not take upon himself to distribute it to them as they stand in need of it. They manufacture some coarse stuffs; and the necessaries they are in want of are purchased with pearls, and with wine nearly resembling that of Madeira, which they sell to the Mexicans and to the galleons, and which experience hath shown the necessity of prohibiting in California. A few laws, which are very simple, are sufficient to regulate this rising state. In order to enforce them, the missionary chooses the most intelligent person of the village; who is empowered to whip and imprison; the only punishments of which they have any knowledge. In all California there are only two garrisons, each consisting of 30 men and a soldier with every missionary. These troops were chosen by the legislators, though they are paid by the government. Were the court of Madrid to push their interest with half the zeal of the Jesuits, California might become one of the most valuable of their acquisitions, on account of the pearls and other valuable articles of commerce which the country contains. At present the little Spanish town near Cape St Lucar is made use of for no other purpose than as a place of refreshment for the Manila ships, and the head residence of the missionaries.

CALIGA, in Roman Antiquity, was the proper sol-

California,
Caliga.

Caligati
||
Caliph.

soldier's shoe, made in the sandal fashion, without upper leather to cover the superior part of the foot, tho' otherwise reaching to the middle of the leg, and fastened with thongs. The sole of the caliga was of wood, like the sabot of the French peasants, and its bottom stuck full of nails; which clavi are supposed to have been very long in the shoes of the scouts and sentinels; whence these were called by way of distinction, *caligæ speculatoriæ*; as if by mounting the wearer to a higher pitch, they gave a greater advantage to the sight: though others will have the *caligæ speculatoriæ* to have been made soft and woolly, to prevent their making a noise. From these *caligæ* it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common soldier.

According to Du Cange, a sort of *caligæ* was also worn by monks and bishops, when they celebrated mass pontifically.

CALIGATI, an appellation given by some ancient writers to the common soldiers in the Roman armies, by reason of the caliga which they wore. The caliga was the badge or symbol of a soldier; whence to take away the caliga and belt, imported a dismissing or cashiering.

CALIGO, or CALIGATIO, in Medicine, an opacity, or cloudiness of the anterior surface of the crystalline, causing a dimness or suffusion of sight.

CALIGULA, the Roman emperor and tyrant, A. D. 37, began his reign with every promising appearance of becoming the real father of his people; but at the end of eight months he was seized with a fever, which, it is thought, left a frenzy on his mind: for his disposition totally changed, and he committed the most atrocious acts of impiety, cruelty, and folly; such as proclaiming his horse consul, feeding it at his table, introducing it to the temple in the vestments of the priests of Jupiter, &c. and causing sacrifices to be offered to himself, his wife, and the horse. After having murdered many of his subjects with his own hand, and caused others to be put to death without any just cause, he was assassinated by a tribune of the people as he came out of the amphitheatre, A. D. 41, in the 29th year of his age, and 4th of his reign.

CALIN, a compound metal, whereof the Chinese make tea-canisters, and the like. The ingredients seem to be lead and tin.

CALIPH, or KHALIF, the supreme ecclesiastical dignity among the Saracens; or, as it is otherwise defined, a sovereign dignity among the Mahometans, vested with absolute authority in all matters relating both to religion and policy. In the Arabic it signifies *successor* or *vicar*; the caliphs bearing the same relation to Mahomet that the popes pretend they do to Jesus Christ or St Peter. It is at this day one of the Grand Signior's titles, as successor of Mahomet; and of the Sophi of Persia, as successor of Ali. One of the chief functions of the caliph, in quality of imam or chief priest of Mussulmanism, was to begin the public prayers every Friday in the chief mosque, and to deliver the *khotbak* or sermon. In after-times, they had assistants for this latter office; but the former the caliphs always performed in person. The caliph was also obliged to lead the pilgrims to Mecca in person, and to march at the head of the armies of his empire. He

granted investiture to princes; and sent swords, standards, gowns, and the like, as presents to princes of the Mahometan religion; who, though they had thrown off the yoke of the caliphate, nevertheless held of it as vassals. The caliphs usually went to the mosque mounted on mules; and the sultans selgiucides, though masters of Bagdad, held their stirrups, and led their mule by the bridle some distance on foot, till such time as the caliphs gave them the sign to mount on horseback. At one of the windows of the caliph's palace, there always hung a piece of black velvet 20 cubits long, which reached to the ground, and was called the *caliph's sleeve*; which the grandees of his court never failed to kiss every day, with great respect. After the destruction of the caliphate by Hulaku, the Mahometan princes appointed a particular officer, in their respective dominions, who sustains the sacred authority of caliph. In Turkey, he goes under the denomination of *musti*, and in Persia under that of *sadne*.

CALIPHATE, the office or dignity of caliph: See the preceding article. The succession of caliph continued from the death of Mahomet till the 655th year of the Hegira, when the city of Bagdad was taken by the Tartars. After this, however, there were persons who claimed the caliphate, as pretending to be of the family of the Abassides, and to whom the sultans of Egypt rendered great honours at Cairo, as the true successors of Mahomet: but this honour was merely titular, and the rights allowed them only in matters relating to religion; and though they bore the sovereign title of *caliphs*, they were nevertheless subjects and dependents of the sultans. In the year of the Hegira 361, a kind of caliphate was erected by the Fatemites in Africa, and lasted till it was suppressed by Saladdin. Historians also speak of a third caliphate in Gemen or Arabia Felix, erected by some princes of the family of the Jobites. The emperors of Morocco assume the title of *grand cherifs*; and pretend to be the true caliphs, or successors of Mahomet, though under another name.

CALIPPIC PERIOD, in chronology, a series of seventy-six years, perpetually recurring; which elapsed the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, return to the same day of the solar year. Meton, an hundred years before, had invented the period, or cycle, of nineteen years; assuming the quantity of the solar year 365 d. 6 h. 18' 56" 50³ 31⁴ 34⁵; and the lunar month, 29 d. 12 h. 45' 47" 26³ 48⁴ 30⁵: but Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's period by 4, and thence arose a period of 76 years, called the *Calippic*. The Calippic period, therefore, contains 2,7759 days: and since the lunar cycle contains 235 lunations, and the *Calippic period* is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 4384th of the Julian period. It is demonstrated, however, that the Calippic period itself is not accurate; that it does not bring the new and full moons precisely to their places: 8 h. 5' 52" 60⁰⁰, being the excess of 940 lunations above 76 solar years; but brings them too late, by a whole day in 225 years.

CALISTA, in fabulous history, the daughter of Lycaon king of Arcadia, and one of the nymphs of Diana.

Caliphate
||
Calista.

Calix
||
Call.

Diana. Being beloved by Jupiter, that god assumed the form of the goddess of chastity, by which means he debauched her: but her disgrace being revealed, as she was bathing with her patroness, the incensed deity turned her and the son with which she was pregnant into bears; when Jupiter, in compassion to her sufferings, took them up into the heavens, and made them the constellations *Ursa Major* and *Ursa Minor*.

CALIX. See CALYX.

CALIXTINS, a name given to those, among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, and professor at Helmstadt, in the duchy of Brunswick, who died in 1656: he opposed the opinion of St. Augustin, on predestination, grace, and free-will, and endeavoured to form an union among the various members of the Romish, Lutheran, and reformed churches; or, rather, to join them in the bonds of mutual forbearance and charity.

CALIXTINS also denote a sect in Bohemia, derived from the Hussites, about the middle of the 15th century, who asserted the use of the cup, as essential to the eucharist. And hence their name; which is formed from the Latin *calix*, a cup.

The Calixtins are not ranked by Romanists in the list of heretics, since in the main they still adhered to the doctrine of Rome. The reformation they aimed at terminated in the four following articles. 1. In restoring the cup to the laity, 2. In subjecting the criminal clerks to the punishment of the civil magistrate. 3. In stripping the clergy of their lands, lordships, and all temporal jurisdiction. 4. In granting liberty to all capable priests to preach the word of God.

CALKA, a kingdom of Tartary, in Asia, to the east of Siberia.

CALKING. See CAULKING.

CALKINS, the prominent parts at the extremities of a horse-shoe, bent downwards, and forged to a sort of point.

Calkins are apt to make horses trip; they also occasion bleymes, and ruin the back sinews. If fashioned in form of a hare's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas, the great square calkins quite spoil the foot.

Calkins are either single or double, that is, at one end of the shoe, or at both: these last are deemed less hurtful, as the horses can tread more even.

CALL, among hunters, a lesson blown upon the horn, to comfort the hounds.

CALL, an English name for the mineral called Tungsten or Wolfram by the Germans.

CALL, among sailors, a sort of whistle or pipe, of silver or brass, used by the boatswain and his mates to summon the sailors to their duty, and direct them in the different employments of the ship. As the call can be sounded to various strains, each of them is appropriated to some particular exercise; such as hoisting, heaving, lowering, veering away, belaying, letting go a tackle, &c. The act of winding this instrument is called piping, which is as attentively observed by sailors as the beat of the drum to march, retreat, rally, charge, &c. is obeyed by soldiers.

CALL, among fowlers, the noise or cry of a bird, especially to its young, or to its mate in coupling-time. One method of catching partridges is by the natural call of a hen trained for the purpose, which

drawing the cocks to her, they are entangled in a net. Different birds require different sorts of calls; but they are most of them composed of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows; which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat bored through, and fitted with a pipe or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a leathern purse in shape like a pear, stuffed with horse-hair, and fitted at the end with the bone of a cat's, hare's, or coney's leg, formed like a flageolet. They are play'd, by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb, to counterfeit the call of the hen-quail.

CALL of the House. See CALLING.

CALLA, WAKE-ROBIN, or *Ethiopian Arum*: A genus of the polyandria order, belonging to the gynandria class of plants; and in the natural method ranking under the 2d order, *Piperita*. The spathe is plain; the spadix covered with florets; there is no calyx; no petals; and the berries are monospermous. Of this there is but one species. It hath thick, fleshy, tuberous roots, which are covered with a thin brown skin, and strike down many strong fleshy fibres into the ground. The leaves have footstalks more than a foot long, which are green and succulent. The leaves are shaped like the point of an arrow; they are eight or nine inches in length, ending in a sharp point, which turns backward; between the leaves arise the footstalk of the flower, which is thick, smooth, of the same colour as the leaves, rises above them, and is terminated by a single flower, shaped like those of the arum, the hood or spathe being twisted at bottom, but spreads open at the top, and is of a pure white colour. When the flowers fade, they are succeeded by roundish fleshy berries, compressed on two sides, each containing two or three seeds. This plant grows naturally at the Cape of Good Hope. It propagates very fast by offsets, which should be taken off in the latter end of August, at which time the old leaves decay; for at this time the roots are in their most inactive state. They are so hardy as to live without any cover in mild winters, if planted in a warm border and dry soil; but, with a little shelter in hard frost, they may be preserved in full growth very well.

CALLA-Sufung, a town of Asia, in the island of Bouton in the East Indies. It is seated about a mile from the sea, on the top of a small hill surrounded with cocoa nut-trees. See BOUTON.

CALLAO, a strong town of South America, in Peru. It is the port of Lima, from which it is distant about five miles. The town is built on a low flat point of land on the sea-shore. It is fortified; but the fortifications were much damaged by the last great earthquake, and have not since been repaired. The town is not above nine or ten feet above the level of high-water mark; but the tide does not commonly rise or fall above five feet. The streets are drawn in a line; but are full of dust, which is very troublesome. In a square near the sea-side are the governor's house, the viceroy's palace, the parish-church, and a battery of three pieces of cannon. On the north side are the

Call
||
Callao.

ware-

Calle
Calligra-
phus.

warehouses for the merchandise brought from Chili, Mexico, and other parts of Peru. The other churches are built with reeds, and covered with timber or clay, but they look tolerably neat. There are five monasteries and an hospital, though the number of families does not exceed 400. The trade of Callao is considerable. From Chili they bring cordage, leather, tallow, dried fish, and corn; from Chiloe, cedar-planks, woollen manufactures, and carpets; from Peru, sugars, wines, brandy, masts, cordage, timber for shipping, cacao, tobacco, and molasses; from Mexico, pitch, tar, woods for dyeing, sulphur, balsam of Peru both white and brown, as well as commodities from China. At the port of Callao the watering is easy, but the wood is a mile or two distant. Earthquakes are very frequent in these parts, which have done vast mischief to Lima and Callao. W. Long. 76. 15. S. Lat. 12. 29.

CALLE (anc. geog.), a town of Hither Spain, situated on an eminence which hangs over the river Durio; whose port was at the mouth of the river. Now *Porto, Oporto, or Port a Port*.

CALLEN, a town of Ireland, in the county of Kilkenny and province of Leinster, about ten miles south-west of Kilkenny. W. Long. 7. 22. N. Lat. 52. 25.

CALLICARPA. See *JOHNSONIA*.

CALLICO, in commerce, a sort of cloth resembling linens made of cotton. The name is taken from that of Callicut, a city on the coast of Malabar, being the first place at which the Portuguese landed when they discovered the India trade. The Spaniards still call it *calicu*.

Calicoes are of different kinds, plain, printed, painted, stained, dyed, chints, muslins, and the like, all included under the general denomination of *calicoes*. Some of them are painted with various flowers of different colours: others are not stained, but have a stripe of gold and silver quite through the piece, and at each end is fixed a tissue of gold, silver, and silk, intermixed with flowers. The printing of calicoes was first set on foot in London about the year 1676.

CALLICRATES, an ancient sculptor, who engraved some of Homer's verses on a grain of millet, made an ivory chariot that might be concealed under the wing of a fly, and an ant of ivory in which all the members were distinct: but Ælian justly blames him for exerting his genius and talents in things so useless, and at the same time so difficult. He flourished about the year 472 before Christ.

CALLIGONUM, in botany: A genus of the digynia order belonging to the polyandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. The calyx is pentaphyllous, without petals or styles; the fruit hispid and monospermous. There is but one species, which is found on Mount Arrarat.

CALLIGRAPHUS anciently denoted a copyist, or scrivener, who transcribed fair, and at length, what the notaries had taken down in notes or minutes. The word is compounded of *καλλος*, *beauty*, and *γραφω*, *I write*. The minutes of acts, &c. were always taken in a kind of cypher, or short-hand; such as the notes of Tyro in Gruter: by which means the notaries, as the Latins called them, or the *σημειογραφοι* and *ταχυγραφοι*,

as the Greeks called them, were enabled to keep pace with a speaker or person who dictated. These notes, being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. These persons were called *calligraphi*; a name frequently met with in the ancient writers.

CALLIGRAPHY, the art of fair writing. Callicrates is said to have written an elegant distich on a sesamum seed. Junius speaks of a person, as very extraordinary, who wrote the apostles creed, and beginning of St John's Gospel, in the compass of a farthing. What would he have said of our famous Peter Bale, who in 1575 wrote the Lord's prayer, creed, ten commandments, and two short prayers in Latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compass of a single penny, incased in a ring and border of gold, and covered with a crystal, all so accurately wrought as to be very legible?

CALLIMACHUS, a celebrated architect, painter, and sculptor, born at Corinth, having seen by accident a vessel about which the plant called *acanthus* had raised its leaves, conceived the idea of forming the Corinthian capital. (See *ACANTHUS*, and Plate XXXIV. fig. 4.) The ancients assure us, that he worked in marble with wonderful delicacy. He flourished about 540 B. C.

CALLIMACHUS, a celebrated Greek poet, native of Cyrene in Libya, flourished under Ptolemy Philadelphus and Ptolemy Evergetes kings of Egypt, about 280 years before Christ. He passed, according to Quintilian, for the prince of the Greek elegiac poets. His style is elegant, delicate, and nervous. He wrote a great number of small poems, of which we have only some hymns and epigrams remaining. Catullus has closely imitated him, and translated into Latin verse his small poem on the locks of Berenice. Callimachus was also a good grammarian and a learned critic. There is an edition of his remains, by Mess. le Fevre, quarto; and another in two volumes octavo, with notes by Spanhein, Grævius, Bently, &c.

CALLING the HOUSE, in the British parliament, is the calling over the members names, every one answering to his own, and going out of the house, in the order in which he is called: this they do in order to discover whether there be any persons there not returned by the clerk of the crown, or if any member be absent without leave of the house.

CALLINICUS of Heliopolis, inventor of a composition to burn in the water, called the *Greek*, and since *Wild, Fire*. See *Grecian FIRE*.

CALLINUS of Ephesus, a very ancient Greek poet, inventor of elegiac verse; some specimens of which are to be found in the collection of Stobæus. He flourished about 776 years before Christ.

CALLIONYMUS, the DRAGONET, in ichthyology, a genus of fishes belonging to the order of jugularies. The upper lip is doubled up; the eyes are very near each other; the membrane of the gills has six radii; the operculum is shut; the body is naked; and the belly-fins are at a great distance from each other. There are three species of callionymus, viz. 1. The lyra, with the first bone of the back-fin as long as the body of the animal, and a cirrus at the anus. It is found as far north as Norway and Spitzbergen, and as far

Calligra-
phy
||
Calliony-
mus.

Calliope
||
Calisia.

far south as the Mediterranean sea, and is not unfrequent on the Scarborough coasts, where it is taken by the hook in 30 or 40 fathoms water. It is often found in the stomach of the cod-fish. 2. The dracunculus, with the first bone of the back-fin shorter than its body, which is of a spotted yellow colour. It frequents the shores of Genoa and Rome. 3. The indicus has a smooth head, with longitudinal wrinkles; the lower jaw is a little longer than the upper one; the tongue is obtuse and emarginated; the apertures of the gills are large: it is of a livid colour, and the anus is in the middle of the body. It is a native of Asia.

CALLIOPE, in the Pagan mythology, the muse who presides over eloquence and heroic poetry. She was thus called from the sweetness of her voice, and was reckoned the first of the nine sisters. Her distinguishing office was to record the worthy actions of the living; and accordingly she is represented with tablets in her hand.

CALLIPÆDIA, the art of getting or breeding fine and beautiful children. We find divers rules and practices relating to this art, in ancient and modern writers. Among the magi, a sort of medicine called *ermesia* was administered to pregnant women, as a means of producing a beautiful issue. Of this kind were the kernels of pine-nuts ground with honey, myrrh, saffron, palm-wine, and milk. The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child placed at the door of the public baths, that the women at going out being struck with his appearance, and retaining the idea, might all have children as fine as he. The Chinese take still greater care of their breeding women, to prevent uncouth objects of any kind from striking their imagination. Musicians are employed at night to entertain them with agreeable songs and odes, in which are set forth all the duties and comforts of a conjugal and domestic life; that the infant may receive good impressions even before it is born, and not only come forth agreeably formed in body, but well disposed in mind. Callipædia, nevertheless, seems to have been first erected into a just art by Claude Quillet de Chinon, a French abbot, who, under the fictitious name of *Calvidus Lætus*, has published a fine Latin poem in four books, under the title of *Callipædia, seu de pulchræ prolis habendæ ratione*; wherein are contained all the precepts of that new art. There is a translation of it into English verse by Mr Rowe.

CALLIPOLIS, (anc. geog.) the name of several cities of antiquity, particularly one upon the Hellespont, next the Propontis, and opposite to Lampacus in Asia. Now GALLIPOLI.

CALLIPPIC PERIOD. See CALIPPIC.

CALLIRHOE, (anc. geog), surnamed *Enneacrunos*, from its nine springs or channels; a fountain not far from Athens, greatly adorned by Pisistratus, where there were several wells, but this only the running spring. Callirhoe was also the name of a very fine spring of hot water beyond Jordan near the Dead Sea, into which it empties itself.

CALISIA, in botany: A genus of the monogymia order, belonging to the triandria class of plants; and in the natural method ranking under the 6th order, *Ensatæ*. The calyx is triphyllous; the petals

are three; the antheræ are double; and the capsule is bilocular. There is but one species, a native of America.

CALLISTEA, in Grecian antiquity, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest. There was another of these contentions at the festival of Ceres Eleusinia among the Parrhasians, and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, being accompanied by his friends, who adorned him with ribbons, and crowned him with a garland of myrtle.

CALLISTHENES the philosopher, disciple and relation of Aristotle, by whose desire he accompanied Alexander the Great in his expeditions; but proving too severe a censurer of that hero's conduct, he was put by him to the torture (on a suspicion of a treasonable conspiracy), and died under it, 328 years before Christ.

CALLISTRATUS, an excellent Athenian orator, was banished for having obtained too great an authority in the government. Demosthenes was so struck with the force of his eloquence, and the glory it procured him, that he abandoned Plato, and resolved from thenceforward to apply himself to oratory.

CALLITRICHE, or STAR-GRASS, in botany: A genus of the digynia order, belonging to the monandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx, but two petals, and the capsule is bilocular and tetraspermous.

CALLOO, a fortress in the Netherlands, in the territory of Waes, on the river Scheld, subject to the house of Austria. The Dutch were defeated here by the Spaniards in 1638. E. Long. 4. 10. N. Lat. 51. 15.

CALLOSUM CORPUS, in anatomy, a whitish hard substance, joining the two hemispheres of the brain, and appearing in view when the two hemispheres are drawn back. See ANATOMY, N^o 132.

CALLOT (James), a celebrated engraver born at Nancy in 1593. In his youth he travelled to Rome to learn designing and engraving; and from thence went to Florence, where the grand duke took him into his service. After the death of that prince, Callot returned to his native country; when he was very favourably received by Henry duke of Lorraine, who settled a considerable pension upon him. His reputation being soon after spread all over Europe, the infants of the Netherlands drew him to Brussels, where he engraved the siege of Breda. Louis XIII. made him design the siege of Rochelle, and that of the isle of Rhe. The French king, having taken Nancy in 1631, made Callot the proposal of representing that new conquest, as he had already done the taking of Rochelle: but Callot begged to be excused; and some courtiers resolving to oblige him to do it, he answered, that he would sooner cut off his thumb than do any thing against the honour of his prince and country. This excuse the king accepted; and said, that the duke of Lorraine was happy in having such faithful and affectionate subjects. Callot followed his business so closely, that, though he died at 43 years of age, he is said to have left of his

Calistea
||
Callot.

Callot,
Callus.

own execution about 1500 pieces. The following are a few of the principal. 1. *The murder of the innocents*, a small oval plate, engraved at Florence. Callot engraved the same subject at Nancy, with some difference in the figures on the back-ground. The former is the most rare: a fine impression of it is very difficult to be found. 2. *The marriage of Cana in Galilee*, from Paolo Veronese, a middling-sized plate lengthwise. 3. *The passion of Christ*, on twelve very small upright plates: first impressions very scarce. 4. *St John in the island of Palma*, a small plate, nearly square. 5. *The temptation of St Anthony*, a middling-sized plate, lengthwise. He also engraved the same subject larger; which, though not the best, is notwithstanding the scarcest print. There is a considerable difference in the treatment of the subject in the two prints. 6. *The punishments*, wherein is seen the execution of several criminals. The marks of the best impressions of this plate are, a small square tower which appears above the houses, towards the left, and a very small image of the Virgin placed in an angle of the wall, near the middle of the print. 7. *The miseries of war*, eighteen small plates, lengthwise. There is another set on the same subject, consisting of seven plates less than the former. 8. *The great fair of Florence*, so called because it was engraved at Florence. As several parts of this plate were not equally bitten by the aquafortis, it is difficult to meet with a fine impression. Callot, on his return to Nancy, re-engraved this plate without any alteration. The copy, however, is by no means equal to the original. The first is distinguished from the second by the words *in Firenze*, which appear below at the right hand corner of the plate. The second has these words in the same place, *Fe Florientis, & excudit Nancei*. There is also a large copy of this print, reversed, published by Savery; but the difference is easily distinguished between it and the true print. 9. *The little fair*, otherwise called the *players at bowls*; where also some peasants are represented dancing. This is one of the scarcest of Callot's prints; and it is very difficult to meet with a fine impression of it, for the distances and other parts of the plate failed in the biting it with the aquafortis. 10. *The tilting, or the new street at Nancy*, a middling-sized plate, lengthwise. 11. *The Garden of Nancy*, where young men are playing with a balloon, the same. 12. *View of the Port Neuf*, a small plate, lengthwise. 13. *View of the Louvre*, the same. 14. *Four landscapes*, small plates, lengthwise.

CALLUS, or **CALLOSITY**, in a general sense, any cutaneous, corneous, or osseous hardness, whether natural or preternatural; but most frequently it means the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, or divided parts, in the situation in which they are replaced by the surgeon. A callus, in this last sense, is a sort of jelly, or liquid viscous matter, that sweats out from the small arteries and bony fibres of the divided parts, and fills up the chinks or cavities between them. It first appears of a cartilaginous substance; but at length becomes quite bony, and joins the fractured part so firmly together, that the limb will often make greater resistance to any external violence with this part than with those which were never broken.

CALLUS is also a hard, dense, insensible knob, rising

on the hands, feet, &c. by much friction and pressure against hard bodies.

CALM, the state of rest which appears in the air and sea when there is no wind stirring. A calm is more dreaded by a sea-faring man than a storm if he has a strong ship and sea-room enough; for under the line excessive heat sometimes produces such dead calms, that ships are obliged to stay two or three months without being able to stir one way or other. Two opposite winds will sometimes make a calm. This is frequently observed in the gulph of Mexico, at no great distance from the shore, where some gulf or land-wind will so poise the general easterly wind, as to produce a perfect calm.

Calms are never so great on the ocean as on the Mediterranean, by reason the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm is sometimes so dead, that the face of the water is as clear as a looking-glass; but such calms are almost constant presages of an approaching storm. On the coasts about Smyrna, a long calm is reputed a prognostic of an earthquake.

It is not uncommon for the vessels to be calmed, or becalmed, as the sailors express it, in the road of the constant Levantine winds, in places where they ride near the land. Thus between the two capes of Cartooche toward the main, and cape Antonio in Cuba, the sea is narrow, and there is often a calm produced by some gulf of a land-wind, that poises the Levantine wind, and renders the whole perfectly still for two or three days. In this case, the current that runs here is of use to the vessels, if it sets right; when it sets easterly, a ship will have a passage in three or four days to the Havannah; but if otherwise, it is often a fortnight or three weeks sail, the ship being embayed in the gulf of Mexico.

When the weather is perfectly calm, no wind at all stirring, the sailors try which way the current sets, by means of a boat which they send out, and which will ride at anchor though there is no bottom to be found, as regularly and well as if fastened by the strongest anchor to the bottom. The method is this: they row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathom; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be.

CALM Latitudes, in sea language, are situated in the Atlantic ocean, between the tropic of Cancer and the latitude of 29° N. or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

CALMAR, a strong sea-port of Sweden, in the province of Smaland, divided into two towns, the old and the new; but of the former there remains only the church and a few houses. The new town is built a little way from the other, and has large handsome houses. E. Long. 16. 15. N. Lat. 56. 48.

CALMET (Augustine), one of the most learned and laborious writers of the 18th century, was born at Mesnil le Horgne, a village in the diocese of Toul in France, in the year 1672, and took the habit of the

Bene-

Calm
||
Calmet.

Calmuks
||
Calotte.

Benedictines in 1688. Among the many works he published are, 1. A literal exposition, in French, of all the books in the Old Testament, in nine volumes folio. 2. An historical, critical, chronological, geographical, and literal, dictionary of the Bible, in four vols folio, enriched with a great number of figures of Jewish antiquities. 3. A civil and ecclesiastical history of Lorraine, three vols folio. 4. A history of the Old and New Testament, and of the Jews, in two volumes folio, and seven vols duodecimo. 5. An universal sacred and profane history, in several volumes quarto. He died in 1757.

CALMUCKS. See KALMUCKS.

CALNE, a town of Wiltshire in England, seated on a river of the same name. It has a handsome church, and sends two members to parliament. W. Long. 1. 59. N. Lat. 51. 30.

CALNEH, (anc. geog.) a city in the land of Shinar, built by Nimrod, and the last city mentioned (Gen. x. 10.) as belonging to his kingdom. It is believed to be the same with Calno mentioned in Isaiah (x. 9.), and with Canneh in Ezekiel (xxviii. 23.) with still greater variation. It is observed, that it must have been situated in Mesopotamia, since these prophets join it with Haran, Eden, Assyria, and Chilmad, which carried on a trade with Tyre. It is said by the Chaldee interpreters, as also by Eusebius and Jerom, to be the same with Ctesiphon, standing upon the Tigris, about three miles distant from Seleucia, and that for some time it was the capital city of the Parthians.

CALOGERI, in church-history, monks of the Greek church, divided into three degrees: the novices, called *archari*; the ordinary professed, called *microchemi*; and the more perfect, called *megalochemi*: they are likewise divided into *cænobites*, *anchores*, and *recluses*. The *cænobites* are employed in reciting their offices from midnight to sun-set; they are obliged to make three genuflexions at the door of the choir, and, returning, to bow to the right and to the left, to their brethren. The anchorites retire from the conversation of the world, and live in hermitages in the neighbourhood of the monasteries; they cultivate a little spot of ground, and never go out but on Sundays and holidays to perform their devotions at the next monastery. As for the recluses, they shut themselves up in grottos and caverns on the tops of mountains, which they never go out of, abandoning themselves entirely to Providence: they live on the alms sent them by the neighbouring monasteries.

CALOMEL, or dulcified sublimate of mercury. See PHARMACY, *Index*.

CALOPHYLLUM, in botany: A genus of the monogynia order belonging to the polyandria class of plants: and in the natural method classed under those called *doubtful* by Linnæus. The corolla is tetrapetalous; the calyx tetraphyllous and coloured; the fruit a globose plum. There are two species, both natives of India.

CALOTTE, a cap or coif of hair, satin, or other stuff; an ecclesiastical ornament in most Popish countries. See CAP.

CALOTTE, in architecture, a round cavity or depression, in form of a cap or cup, lathed and plastered, used to diminish the rise or elevation of a moderate cha-
N° 62.

pel, cabinet, alcove, &c. which, without such an expedient, would be too high for other pieces of the apartment.

CALPE, a mountain of Andalusia in Spain; at the foot of which, towards the sea, stands the town of Gibraltar. It is half a league in height towards the land, and so steep that there is no approaching it on that side.

CALPURNIUS (Titus), a Latin Sicilian poet, lived under the emperor Carus and his son. We have seven of his eclogues remaining.

CALQUING, or CALKING, a term used in painting, &c. where the back-side of any thing is covered over with a black or red colour, and the strokes or lines traced through on a waxed plate, wall, or other matter, by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall.

CALTHA, in botany: A genus of the monogynia order belonging to the polyandria class of plants; and in the natural method ranking under the 26th order, *Multiflora*. There is no calyx; there are five petals; no nectaria; the capsules are many, and polyspermous. There is only one species known, which grows naturally in moist boggy lands in many parts of England and Scotland. There is a variety, with very double flowers, which for its beauty is preserved in gardens. It is propagated by parting the roots in autumn. It should be planted in a moist soil and shady situation; and as there are often such places in gardens where few other plants will thrive, so these may be allowed room, and during their season of flowering will afford an agreeable variety. The flowers gathered before they expand, and preserved in salted vinegar, are a good substitute for capers. The juice of the petals, boiled with a little alum, stains paper yellow. The remarkable yellowness of the butter in spring is supposed to be caused by this plant: but cows will not eat it, unless compelled by extreme hunger; and then, Boerhaave says, it occasions such an inflammation, that they generally die. Upon May-day, the country people strew the flowers upon the pavement before their doors. Goats and sheep eat this plant; horses, cows, and swine, refuse it.

CALTROP, in botany. See TRIBULUS.

CALTROP, in military affairs, an instrument with four iron points, disposed in a triangular form, so that three of them are always on the ground, and the fourth in the air. They are scattered over the ground where the enemy's cavalry is to pass, in order to embarrass them.

CALVARIA, in anatomy, the hairy scalp or upper part of the head, which, either by disease or old age, grows bald first.

CALVART (Denis), a celebrated painter, was born at Antwerp in 1552; and had for his masters Prospero Fontana and Lorenzo Sabbatini. He opened a school at Bologna, which became celebrated; and from which proceeded Guido, Albani, and other great masters. Calvart was well skilled in architecture, perspective, and anatomy, which he considered as necessary to a painter, and taught them to his pupils. His principal works are at Bologna, Rome, and Reggio. He died at Bologna in 1619.

CALVARY, a term used in Catholic countries for

Calpe
||
Calvary.

Calvary
Calvin.

Calvin,
Calvinism.

a kind of chapel of devotion raised on a hillock near a city, in memory of the place where Jesus Christ was crucified near the city of Jerusalem. The word comes from the Latin *calvarium*; and that from *calvus*, bald; in regard the top of that hillock was bare and destitute of verdure: which is also signified by the Hebrew word *golgotha*. Such is the Calvary of St Valerian near Paris; which is accompanied with several little chapels, in each of which is represented in sculpture one of the mysteries of the passion.

CALVARY, in heraldry, a cross so called, because it resembles the cross on which our Saviour suffered. It is always set upon steps.

CALVERT (George), afterwards lord Baltimore, was born at Kipling in Yorkshire about the year 1582, and educated at Oxford, where he took the degree of bachelor of arts, and afterwards travelled. At his return, he was made secretary to Sir Robert Cecil: he was afterwards knighted, and in 1618 appointed one of the principal secretaries of state. But after he had enjoyed that post about five years, he willingly resigned it; freely owning to his majesty that he was become a Roman-catholic, so that he must either be wanting to his trust, or violate his conscience in discharging his office. This ingenuous confession so affected king James, that he continued him privy-counsellor all his reign, and the same year created him baron of Baltimore in the kingdom of Ireland. He had before obtained a patent for him and his heirs, for the province of Avelon in Newfoundland: but that being exposed to the insults of the French, he abandoned it, and afterwards obtained the grant of a country on the north part of Virginia from Charles I. who called it *Maryland*, in honour of his queen: but he died in April 1632 (aged 50), before the patent was made out. It was, however, filled up to his son Cecil Calvert lord Baltimore; and bears date June 20th 1632. It is held from the crown as part of the manor of Windsor, on one very singular condition, viz. to present two Indian arrows yearly, on Easter Tuesday, at the castle, where they are kept and shown to visitors.—His lordship wrote, 1. A Latin poem on the death of Sir Henry Upton. 2. Speeches in parliament. 3. Various letters of state. 4. The answer of Tom Tell-truth. 5. The practice of princes. And, 6. The lamentation of the kirk.

CALVI, a town of the province of Lavoro, in the kingdom of Naples, situated near the sea, about fifteen miles north of the city of Naples. E. Long. 14. 45. N. Lat. 41. 15.

CALVI is also the name of a sea-port in the island of Corsica, situated on a bay, on the west side of the island, about 40 miles south-west of Bastia. E. Long. 9. 5. N. Lat. 42. 16.

CALVIN (John), the celebrated reformer of the Christian church from Romish superstitions and doctrinal errors, and founder of the sect since called *Calvinists*, was born in 1509. He was the son of a cooper of Noyon in Picardy; and his real name was *Chauvin*, which he chose to latinize into *Calvinus*, styling himself in the title-page to his first work (a Commentary on *Seneca de clementia*), "Lucius Calvinus, Civis Romanus;" an early proof of his pride, at about 24 years of age. In 1529, he was rector of Pont l'Eveque; and in 1534 he threw up this benefice, separating himself

entirely from the Romish church. The persecution against the Protestants in France (with whom he was now associated) obliged him to retire to Basle in Switzerland: here he published his famous Institutes of the Christian religion in 1535. The following year, he was chosen professor of divinity, and one of the ministers of the church, at Geneva. The next year, viz. 1537, he made all the people solemnly swear to a body of doctrines; but finding that religion had not yet had any great influence on the morals of the people, he, assisted by other ministers, declared, that since all their admonitions and warnings had proved unsuccessful, they could not celebrate the holy sacrament as long as these disorders reigned; he also declared, that he could not submit to some regulations made by the synod of Berne. Upon which the Syndics having summoned the people, it was ordered that Calvin and two other ministers should leave the city within two days. Upon this Calvin retired to Strasburg, where he established a French church, of which he was the first minister, and was also chosen professor of divinity there. Two years after he was chosen to assist at the diet appointed by the emperor to meet at Worms and at Ratisbon in order to appease the troubles occasioned by the difference of religion. He went with Bucer, and entered into a conference with Melancton. The people of Geneva now entreated him to return; to which he consented, and arrived at Geneva, September 13th 1541. He began with establishing a form of ecclesiastical discipline, and a consistorial jurisdiction, with the power of inflicting all kinds of canonical punishments. This was greatly disliked by many persons, who imagined that the papal tyranny would soon be revived. Calvin, however, asserted on all occasions the rights of his consistory with inflexible strictness; and he caused Michael Servetus to be burnt at the stake for writing against the doctrine of the Trinity. But though the rigour of his proceedings sometimes occasioned great tumults in the city, yet nothing could shake his steadiness and inflexibility. Amongst all the disturbances of the commonwealth, he took care of the foreign churches in England, France, Germany, and in Poland; and did more by his pen than his presence, sending his advice and instructions by letter, and writing a great number of books. This great reformer died on the 27th of May 1564, aged 55. His works were printed together at Amsterdam in 1671, in nine volumes folio: the principal of which are his Institutes, in Latin, the best edition of which is that of Robert Stephens in 1553, in folio; and his Commentaries on the Holy Scriptures.—Calvin is universally allowed to have had great talents, an excellent genius, and profound learning. His style is grave and polite. Independent of his spiritual pride, his morals were exemplary; for he was pious, sober, chaste, laborious, and disinterested. But his memory can never be purified from the stain of burning Servetus: it ill became a reformer to adopt the most odious practice of the corrupt church of Rome.

CALVINISM, the doctrine and sentiments of Calvin and his followers. Calvinism subsists in its greatest purity in the city of Geneva; and from thence it was first propagated into Germany, France, the United Provinces, and England. In France it was abolished by the revocation of the edict of Nantz in 1685.

Calvinism
||
Calvities.

It has been the prevailing religion in the United Provinces ever since the year 1571. The theological system of Calvin was adopted, and made the public rule of faith in England, under the reign of Edward VI. and the church of Scotland was modelled by John Knox, the disciple of Calvin, agreeably to the doctrine, rites, and form of ecclesiastical government, established at Geneva. In England it has declined since the time of queen Elizabeth; though it still subsists, some say a little allayed, in the articles of the established church; and in its rigour in Scotland.

The distinguishing theological tenets of Calvinism, as the term is now generally applied, respect the doctrines of PREDESTINATION, or particular ELECTION and REPROBATION, original SIN, particular REDEMPTION, effectual, or, as some have called it, irresistible GRACE in regeneration, JUSTIFICATION by faith, PERSEVERANCE, and the TRINITY. See each of these articles.

Besides the doctrinal part of Calvin's system, which, so far as it differs from that of other reformers of the same period, principally regarded the absolute decree of God, whereby the future and eternal condition of the human race was determined out of mere sovereign pleasure and free-will; it extended likewise to the discipline and government of the Christian church, the nature of the Eucharist, and the qualification of those who were intitled to the participation of it. Calvin considered every church as a separate and independent body, invested with the power of legislation for itself. He proposed that it should be governed by presbyteries and synods, composed of clergy and laity, without bishops, or any clerical subordination; and maintained, that the province of the civil magistrate extended only to its protection and outward accommodation. In order to facilitate an union with the Lutheran church, he acknowledged a real, though spiritual, presence of Christ, in the Eucharist, that true Christians were united to the man Christ in this ordinance, and that divine grace was conferred upon them, and sealed to them, in the celebration of it; and he confined the privilege of communion to pious and regenerate believers. In France the Calvinists are distinguished by the name of *Huguenots*; and, among the common people, by that of *Parpailots*. In Germany they are confounded with the Lutherans, under the general title *Protestants*; only sometimes distinguished by the name *Reformed*.

CALVINISTS, in church-history, those who follow the opinions of CALVIN. See the two preceding articles.

Crypto-CALVINISTS, a name given to the favourers of Calvinism in Saxony, on account of their secret attachment to the Genevan doctrine and discipline. Many of them suffered by the decrees of the convocation of Torgaw, held in 1576. The Calvinists in their progress have divided into various branches, or lesser sects.

CALVISIUS (Seth), a celebrated German chronologer in the beginning of the 17th century. He wrote *Elenchus calendarii Gregoriani, et duplex calendarii melioris forma*, and other learned works, together with some excellent treatises on music. He died in 1617, aged 61.

CALVITIES, or CALVITIUM, in medicine, bald-

ness, or a want of hair, particularly on the sciniput, occasioned by the moisture of the head, which should feed it, being dried up, by some disease, old age, or the immoderate use of powder, &c. See ALOPECIA.

CALUMET, a symbolical instrument of great importance among the American Indians.—It is nothing more than a pipe, whose bowl is generally made of a soft red marble: the tube of a very long reed, ornamented with the wings and feathers of birds. No affair of consequence is transacted without the calumet. It ever appears in meetings of commerce or exchanges; in congresses for determining of peace or war; and even in the very fury of a battle. The acceptance of the calumet is a mark of concurrence with the terms proposed; as the refusal is a certain mark of rejection. Even in the rage of a conflict this pipe is sometimes offered; and if accepted, the weapons of destruction instantly drop from their hands, and a truce ensues. It seems the sacrament of the savages; for no compact is ever violated which is confirmed by a whiff from this holy reed. When they treat of war, the pipe and all its ornaments are usually red, or sometimes red only on one side. The size and decorations of the calumet are for the most part proportioned to the quality of the persons to whom they are presented, and to the importance of the occasion. The calumet of peace is different from that of war. They make use of the former to seal their alliances and treaties, to travel with safety, and to receive strangers; but of the latter to proclaim war. It consists of a red stone, like marble, formed into a cavity resembling the head of a tobacco pipe, and fixed to a hollow reed. They adorn it with feathers of various colours; and name it the calumet of the sun, to which luminary they present it, in expectation of thereby obtaining a change of weather as often as they desire. From the winged ornaments of the calumet, and its conciliating uses, writers compare it to the caduceus of Mercury, which was carried by the caduceatores, or messengers of peace, with terms to the hostile states. It is singular, that the most remote nations, and the most opposite in their other customs and manners, should in some things have, as it were, a certain consent of thought. The Greeks and the Americans had the same idea, in the invention of the caduceus of the one, and the calumet of the other.

Dance of the CALUMET, is a solemn rite among the Indians on various occasions. They dare not wash themselves in rivers in the beginning of summer, nor taste of the new fruits, without performing it; and the same ceremony always confirms a peace or precedes a war. It is performed in the winter-time in their cabins, and in summer in the open fields. For this purpose they choose a spot among trees to shade them from the heat of the sun, and lay in the middle a large mat, as a carpet, setting upon it the monitor, or god, of the chief of the company. On the right hand of this image they place the calumet, as their great deity, erecting around it a kind of trophy with their arms. Things being thus disposed, and the hour of dancing come, those who are to sing take the most honourable seats under the shade of the trees. The company is then ranged round, every one, before he sits down, saluting the monitor, which is done by blowing upon

Calumet
||
Calybites.

upon it the smoke of their tobacco. Each person next receives the calumet in rotation, and holding it with both hands, dances to the cadence of the vocal music, which is accompanied with the beating of a sort of drum. During this exercise, he gives a signal to one of their warriors, who takes a bow, arrow, and axe, from the trophies already mentioned, and fights him; the former defending himself with the calumet only, and both of them dancing all the while. This mock engagement being over, he who holds the calumet makes a speech, in which he gives an account of the battles he has fought, and the prisoners he has taken, and then receives a cloak, or some other present, from the chief of the ball. He then resigns the calumet to another, who having acted a similar part, delivers it to a third, who afterwards gives it to his neighbour, till at last the instrument returns to the person that began the ceremony, who presents it to the nation invited to the feast, as a mark of their friendship, and a confirmation of their alliance, when this is the occasion of the entertainment.

CALUMNY, the crime of accusing another falsely, and knowingly so, of some heinous offence.

Oath of CALUMNY, Juramentum (or rather *Jusjurandum*) *Calumnie*, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff that he did not bring his charge, and the defendant that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint or libel was dismissed; if the defendant, it was taken *pro confesso*. This custom was taken from the ancient athlete; who, before they engaged, were to swear that they had no malice, nor would use any unfair means for overcoming each other. The *juramentum calumnie* is much disused, as a great occasion of perjury. Anciently the advocates and proctors also took this oath; but of late it is dispensed with, and thought sufficient that they take it once for all at their first admission to practice. See also LAW, Part III. n° clxxxiv. 7.

CALVUS (Cornelius Licinius), a celebrated Roman orator, was the friend of Catullus; and flourished 64 B. C. Catullus, Ovid, and Horace, speak of him.

CALX properly signifies *lime*, but is also used by chemists and physicians for a fine powder remaining after the calcination or corrosion of metals and other mineral substances. All metallic calces, at least all those made by fire, are found to weigh more than the metal from which they were originally produced. See the article FIRE.

CALX Nativa, in natural history, a kind of marly earth, of a dead whitish colour, which, if thrown into water, makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime or plaster of Paris.

CALX Viva, or *Quick-lime*, that whereon no water has been cast, in contradistinction to lime which has been slaked by pouring water on it.

CALYBITES, the inhabitant of a cottage, an appellation given to divers saints on account of their long residence in some hut, by way of mortification.

The word is formed from *καλυπτα*, *tego*, I cover; whence *καλυβη*, a little cot.—The Romish church commemorates St John the caly bites on the 15th of December.

Calycan-
themæ,
Calycan-
thus.

CALYCANTHEMÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnaeus, in which are the following genera, viz. epilobium, œnothera, jussiea, ludwigia, oldenlandia, isnar-da, &c. See BOTANY, sect. vi. 17.

CALYCANTHUS, in botany: A genus of the polygynia order, belonging to the icofandria class of plants; and in the natural method classed with those of which the order is doubtful. The calyx is monophyllous, urceolate, or blown up; squarrose, or frizzled with small coloured leaves, the corolla consisting of the leaves on the calyx; the styles are numerous, each with a glandular stigma; the seeds are many, each with a train, within a succulent calyx. There are two species; namely, 1. The præcox, which is not quite inured to this climate; and, 2. The floridus, a flowering calycanthus, or Carolina allspice tree, a native of Carolina. It seldom grows, at least with us, to more than five feet high. It divides into many branches irregularly near the ground. They are of a brown colour, and being bruised emit a most agreeable odour. The leaves that garnish this delightful aromatic are of an oval figure, pointed: They are near four inches long, and are at least two and a half broad, and are placed opposite by pairs on the branches. At the end of these stand the flowers, of a kind of chocolate-purple colour, and which are possessed of the opposite qualities of the bark on the branches. They stand single on their short footstalks, come out in May and June, and are succeeded by ripe seeds in England. The propagation of this shrub is not very difficult; though more than common care must be taken, after small plants are obtained, to preserve them till they are of a size to be ventured abroad. The last year's shoots, if laid in the ground, the bark especially being a little bruised, will strike root within the compass of twelve months, particularly if the layers are shaded, and now and then watered in the summer's drought. In the spring they should be taken off, and planted in pots; and if these are afforded a small degree of heat in a bed, they will strike so much the sooner and stronger. After they have been in this bed a month or six weeks, they should be taken out. In the heat of the summer they should be placed in the shade; and if the pots are plunged into the natural ground, it will be so much the better. At the approach of the succeeding winter's bad weather, the pots should be removed into the green-house, or some shelter, and in the spring may resume their old stations: and this should be repeated till they are of a proper size and strength to be planted out to stand. If the pots in which they were first planted were small, they may be shifted into larger a spring or two after; and, when they have got to be pretty strong plants, they may be turned out, mould and all, into the places where they are to remain. By this care of potting them, and housing them during the severe weather in winter, the young crop will be preserved; otherwise, if they were planted immediately abroad, the first hard frost the ensuing winter would destroy them all: Tanner's bark about their roots will be the most proper security;

Calycifloræ
||
Camaieu.

security; as they are at best, when full grown, but tender plants, and must have the warmest situation and the driest soil.

CALYCIFLORÆ, in botany, the 16th order in Linnæus's *Fragmenta methodi naturalis*, consisting of plants which, as the title imports, have the stamina (the flower) inserted into the calyx. This order contains the following genera, viz. *cleagnus*, *hippophæ*, *osyris*, and *trophis*. See **BOTANY**, sect. vi. 16.

CALYCISTÆ (from *calyx* the flower-cup), systematic botanists, so termed by Linnæus, who have arranged all vegetables from the different species, structure, and other circumstances, of the calyx or flower-cup. The only systems of this kind are the *Character plantarum novus*, a posthumous work of Magnolius, professor of botany at Montpellier, published in 1720; and Linnæus's *Methodus calycina*, published in his *Classes plantarum*, at Leyden, in 1738. See **BOTANY**, p. 425.

CALYDON, (anc. geog.), a town of *Æolia*, situated seven miles and a half from the sea, and divided by the river *Evenus*: the country was anciently called *Æolis*, from the *Æolians* its inhabitants. This country was famous for the story of *Meleager* and the *Calydonian* boar.

CALYPSO, in fabulous history, a goddess, who was the daughter of *Oceanus* and *Tethys*, or, as others say, of *Atlas*. She was queen of the island of *Ogygia*, which from her was called the island of *Calypso*. According to *Homer*, *Ulysses* suffered shipwreck on her coast, and staid with her several years.

CALYPTRA, among botanists, a thin membranaceous involucre, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have calyptræ.

CALYX, among botanists, a general term expressing the cup of a flower, or that part of a plant which surrounds and supports the other parts of the flower.

The cups of flowers are very various in their structure, and on that account distinguished by several names, as *perianthium*, *involucreum*, *spatha*, *gluma*, &c. See **BOTANY**, p. 439.

CALZADA, a town of Old Castile in Spain, seated on the river *Leglera*. W. Long. 2. 47. N. Lat. 42. 12.

CAMÆA, in natural history, a genus of the semi-transparent gems approaching to the onyx structure, being composed of zones, and formed on a crystalline basis; but having their zones very broad and thick, and laid alternately one on another, with no common matter between; usually less transparent, and more debased with earth, than the onyxes.

1. One species of the *camæa* is the dull-looking onyx, with broad black and white zones; and is the *camæa* of the moderns, and the *Arabian onyx*. This species is found in Egypt, Arabia, Persia, and the East Indies. 2. Another species of the *camæa* is the dull broad zoned, green and white *camæa*, or the *jaspicameo* of the Italians: it is found in the East Indies, and in some parts of America. 3. The third is the hard *camæa*, with broad white and chestnut coloured veins. 4. The hard *camæa*, with bluish, white, and flesh-coloured broad veins, being the *sardonix* of Pliny's time, only brought from the East Indies.

CAMAIEU, or **CAMAYEU**, a word used to express a peculiar sort of onyx: also by some to express a

stone, whereon are found various figures, and representations of landscapes, &c. formed by a kind of *lusus nature*; so as to exhibit pictures without painting. The word comes from *camehuia*, a name the Orientals give to the onyx, when they find, in preparing it, another colour; as who should say, a *second stone*. It is of these *cameieus* Pliny is to be understood when he speaks of the manifold picture of gems, and the party-coloured spots of precious stones: *Gemmarum pictura tam multiplex, lapidumque tam discoloris macula*.

CAMAIEU is also applied by others to those precious stones, as onyxes, cornelians, and agates, whereon the lapidaries employ their art to aid nature, and perfect those representations. See **CAMÆA**.

CAMAIEU is also frequently applied to any kind of gem, whereon figures may be engraven either indentedly or in relief. In this sense the lapidaries of Paris are called in their statutes, *cutters of camayeux*.

A society of learned men at Florence undertook to procure all the *cameos* or *camayeux*, and intaglios in the great duke's gallery to be engraven; and began to draw the heads of divers emperors in *cameos*.

CAMAIEU is also used for a painting, wherein there is only one colour; and where the lights and shadows are of gold, wrought on a golden or azure ground. When the ground is yellow, the French call it *cirage*; when grey, *griffaille*. This kind of work is chiefly used to represent basso relievos: the Greeks call pieces of this sort *μονοχρωματα*.

CAMALDULIANS, **CAMALDUNIANS**, or **CAMALDOLITES**, an order of religious, founded by *Romuald*, an Italian fanatic, in 1023, in the horrible desert of *Camaldoli*, otherwise called *Campo-Malduli*, situate in the state of Florence, on the Apennines. Their rule is that of *St Benedict*; and their houses, by the statutes, are never to be less than five leagues from cities. The *Camaldulians* have not borne that title from the beginning of their order; till the close of the eleventh century they were called *Romualdins*, from the name of their founder. Till that time, *Camaldulian* was a particular name for those of the desert *Camaldoli*; and *D. Grandi* observes, was not given to the whole order, in regard it was in this monastery that the order commenced, but because the regulation was best maintained here.

Guido Grandi, mathematician of the great duke of Tuscany, and a monk of this order, has published *Camaldulian Dissertations*, on the origin and establishment of it.

The *Camaldolites* were distinguished into two classes, of which the one were **COENOBITES**, and the other **EREMITES**.

CAMALODUNUM (anc. geog.), a town of the *Trinobantes*, the first Roman colony in Britain, of veterans, under the emperor. From the *Itineraries* it appears to have stood where now *Malden* stands. It continued to be an open place under the Romans; a place of pleasure rather than strength; yet not unadorned with splendid works, as a theatre and a temple of *Claudius*: which the Britons considered as badges of slavery, and which gave rise to several seditions and commotions. It stands on a bay of the sea, at the mouth of the *Chelmer*, in the county of *Essex*; the modern name is curtailed from the ancient.

CAMARANA, an island of Arabia, in the Red Sea, whose inhabitants are little and black. It is the best

Camaleu
||
Camarana.

Carnassei
||
Cambayes.

best of all the islands in this sea, and here they fish for coral and pearls. N. Lat. 15. 0.

CAMASSEI, or CAMACE, (Andrea), painter of history and landscape, was born at Bevagna, and at first learned the principles of design and colouring from Domenichino; but afterwards he studied in the school of Andrea Sacchi, and proved a very great painter. He was employed in St Peter's at Rome, as also at John Lateran; and his works are extremely admired, for the sweetness of his colouring, the elegance of his thoughts and design, and likewise for the delicacy of his pencil. Sandrart laments that the world was deprived of so promising a genius, in the very bloom of life, when his reputation was daily advancing. He died in 1657. At St John Lateran are to be seen, the Battle of Constantine and Maxentius; and the Triumph of Constantine; which are noble and grand compositions; and they afford sufficient proofs of the happiness of his invention and the correctness of his execution. Also at Wilton, the seat of the earl of Pembroke, there is a picture of Venus with the Graces, said to be by the hand of Camassei.

CAMARCUM, (anc. geog.), the capital of the Nervii, a people of Gallia Belgica, (Antonine, Peutinger); before whose time no mention was made of it. Now Cambray, capital of the Cambresis, in French Flanders. E. Long. 3. 15. Lat. 50. 15.

CAMARINA, (anc. geog.), a city of Sicily, built by the Syracusans on an eminence near the sea, in the south of Sicily, to the west of the promontory Pachynum, between two rivers, the Hipparis and Oanus. Of so famous a city nothing now remains but its name and ancient walls, a mile and a half in compass, with the slight remains of houses: now called *Camarana*.

CAMARINA Palus, a marsh or lake, near the city Camarina, and from which it took its name. In a time of drought, the stench of the lake produced a pestilence; upon which the inhabitants consulted the oracle, whether they should not quite drain it. The oracle dissuaded them: they notwithstanding drained it, and opened a way for their enemies to come and plunder their city: hence the proverb, *Ne moveas Camarinam*, that is, not to remove one evil to bring on a greater. Now *Lago di Camarana*, situate in a beautiful plain, under the very walls of Camarina, and of a triangular form.

CAMAYEU. See CAMATEU.

CAMBAIA, or CAMPAY, a town of Asia, in India, and in the peninsula on this side the Ganges; capital of a province of the same name; but more commonly called *Guzarat*. It is seated at the bottom of a gulph of the same name, on a small river; is a large place with high walls, and has a pretty good trade. The product and manufactures are inferior to few towns in India; for it abounds in corn, cattle, and silk; and cornelian and agate stones are found in its rivers. The inhabitants are noted for embroidery; and some of their quilts have been valued at 40l. It is subject to the Great Mogul. E. Long. 72. 15. N. Lat. 22. 30.

CAMBAYES, in commerce, cotton cloths made at Bengal, Madras, and some other places on the coast of Coromandel. They are proper for the trade of Marseilles, whither the English at Madras send great numbers of them. Many are also imported into Holland.

CAMBER, according to our monkish historians, one of the three sons of Brute, who, upon his father's death, had that part of Britain assigned him for his share, called from him *Cambria* now *Wales*.

Camber
||
Camberlet.

CAMBER-Beam, among builders, a piece of timber in an edifice cut archwise, or with an obtuse angle in the middle, commonly used in platforms, as church-leads, and on other occasions where long and strong beams are required.

CAMBERED-DECKS, among ship-builders. The deck or flooring of a ship is said to be cambered, or to lie cambering, when it is higher in the middle of the ship's length, and droops toward the stem and stern, or the two ends. Also when it lies irregular; a circumstance which renders the ship very unfit for war.

CAMBERT, a French musician in the 17th century, was at first admired for the manner in which he touched the organ, and became superintendant of the music to Anne of Austria the queen-mother. The abbe Perrin associated him in the privilege he obtained of his majesty, of setting up an opera in 1669. Cambert set to music two pastorals, one entitled *Pomona*, the other *Ariadne*, which were the first operas given in France. He also wrote a piece entitled *The pains and pleasures of love*. These pieces pleased the public; yet, in 1672, Lully obtaining the privilege of the opera, Cambert was obliged to come to England, where he became superintendant of the music to king Charles II. and died there in 1677.

CAMBIO, an Italian word which signifies *exchange*; commonly used at Province, and in some other countries, particularly Holland.

CAMBIST, a name given in France to those who trade in notes and bills of exchange. The word *cam-bist*, though a term of antiquity, is even now a technical word, of some use among merchants, traders, and bankers. Some derive it from the Latin *cambium*, or rather *cambio*.

CAMBLET, or CHAMBLET, a stuff sometimes of wool, sometimes silk, and sometimes hair, especially that of goats, with wool or silk: in some, the warp is silk and wool twisted together, and the woof hair.

The true or oriental camblet is made of the pure hair of a sort of goat, frequent about Angora, and which makes the riches of that city, all the inhabitants whereof are employed in the manufacture and commerce of camblets. It is certain we find mentioned in middle-age writers stuffs made of camel's hair, under the denominations of *cameletum* and *camelinum*, whence probably the origin of the term; but these are represented as strangely coarse, rough, and prickly, and seem to have been chiefly used among the monks by way of mortification, as the hair-shirt of later times.

We have no camblets made in Europe of the goats hair alone; even at Brussels, they find it necessary to add a mixture of woollen thread.

England, France, Holland, and Flanders, are the chief places of this manufacture. Brussels exceeds them all in the beauty and quality of its camblets: those of England are reputed the second.

Figured-CAMBLETS, are those of one colour, whereon are stamped various figures, flowers, foliage, &c. by means of hot irons, which are a kind of moulds, passed together with the stuff, under a press. These are chief-

Camblets ly brought from Amiens and Flanders: the commerce of these was anciently much more considerable than at present.

||
Cambray.

Watered-CAMBLETS, those which, after weaving, receive a certain preparation with water; and are afterwards passed under a hot-press, which gives them a smoothness and lustre.

Waved-CAMBLETS, are those whereon waves are impressed, as on tabbies; by means of a calender, under which they are passed and repassed several times.

The manufacturers, &c. of camblets are to take care they do not acquire any false and needless plaits; it being almost impossible to get them out again. This is notorious, even to a proverb: we say, a person is like camblet, he has taken his plait.

CAMBODIA, a kingdom of Asia, in the East Indies, bounded on the north by the kingdom of Laos, on the east by Cochinchina and Chiapa, and on the south and west by the gulph and kingdom of Siam; divided by a large river called *Mecon*. The capital town is of the same name, seated on the western shore of the said river, about 150 miles north of its mouth. This country is annually overflowed in the rainy season, between June and October; and its productions and fruits are much the same with those usually found between the tropics. E. Long. 104. 15. N. Lat. 12. 40.

CAMBODUNUM, (Itinerary); a town of the Brigantes, in Britain; now in ruins, near Almonbury, in York-shire. Westchester, (Talbot.) Also a town of Vindelicia, on the Cambus: now Kempten, in Suabia.

CAMBOGIA, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 38th order, *Tricocceæ*. The corolla is tetrapetalous; the calyx tetraphyllous; and the fruit is a pome with eight cells, and solitary seeds. There is but one species, the gutta, a native of India, which yields the gum-resin known by the name of *gamboge* in the shops. See **GAMBOGE**.

CAMBRASINES, in commerce, fine linen made in Egypt, of which there is a considerable trade at Cairo, Alexandria, and Rosetta, or Raschit. They are called *cambrasines* from their resemblance to cambrics.

CAMBRAY, an archiepiscopal city, the capital of the Cambresis, in the Low Countries, seated on the Scheld. It is defended by good fortifications, and has a fort on the side of the river; and as the land is low on that side, they can lay the adjacent parts under water by means of sluices. Its ditches are large and deep, and those of the citadel are cut into a rock. Clodion became master of Cambray in 445. The Danes burnt it afterwards; since which time it became a free imperial city. It has been the subject of contest between the emperors, the kings of France, and the earls of Flanders. Francis I. let it remain neutral during the war with Charles V. but this last took possession of it in 1543. After this it was given to John of Montluc by Henry III. of France, whom he created prince of Cambray; but the Spaniards took it from Montluc in 1593, which broke his heart. It continued under the dominion of the House of Austria till 1677, when the king of France became master of it, in whose hands it has continued ever since.

The buildings of Cambray are tolerably handsome, and the streets fine and spacious. The place or square

for arms is of an extraordinary largeness, and capable of receiving the whole garrison in order of battle. The cathedral dedicated to the Virgin Mary is one of the finest in Europe. The body of the church is very large, and there are rich chapels, the pillars of which are adorned with marble tombs that are of exquisite workmanship, and add greatly to the beauty of the place. There are two galleries, one of which is of copper, finely wrought. The door of the choir is of the same metal, and well carved. The steeple of this church is very high, and built in the form of a pyramid; and from its top you have a view of the city, which is one of the finest and most agreeable in the Low Countries. There are nine parishes, four abbeys, and several convents for both sexes. The citadel is very advantageously situated on high ground, and commands the whole city. Cambray is one of the most opulent and commercial cities in the Low Countries; and makes every year a great number of pieces of cambric, with which the inhabitants drive a great trade. E. Long. 3. 20. N. Lat. 50. 11.

CAMBRAY (M. de Fenelon, archbishop of). See **FENELON**.

CAMBRESIS, a province of France, in the Netherlands, about 25 miles in length. It is bounded on the north and east by Hainhalt, on the south by Picardy, and on the west by Artois. It is a very fertile and populous country; and the inhabitants are industrious, active, and ingenious. The trade consists principally in corn, sheep, very fine wool, and fine linen cloth. Cambray is the capital town.

CAMBRIA, a name for the principality of Wales.

CAMBRIC, in commerce, a species of linen made of flax, very fine and white; the name of which was originally derived from the city of Cambray, where they were first manufactured. They are now made at other places in France.

The manufacture of cambrics hath long since proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute less than 200,000 *l.* per annum to the interest of France. This proved motive sufficient to induce the parliament of Great Britain to enact many salutary laws to prevent this great loss of our wealth. See 18 Geo. II. c. 36. and 21 Geo. II. c. 26. See also stat. 32 Geo. II. c. 32. and 4 Geo. III. c. 37. which regulates the cambric manufactory, not long since introduced into Winchelsea in Suffex; but very soon abolished. The cambrics now allowed in this country are manufactured in Scotland and Ireland. Any persons convicted of wearing, selling (except for exportation), or making up for hire any cambric or French lawns, are liable to a penalty of 5 *l.* by the two first statutes cited above.

CAMBRIDGE, a town of England, and capital of the county of that name. It takes the name of Cambridge from the bridge over the Cam, which divides the town into two parts. Either it or a place in the neighbourhood was styled *Gaboritum* in the time of the Romans. It suffered much during the wars with the Danes. Here was a castle built by William the Conqueror, of which the gatehouse yet remains, and is now the county goal. By Doomsday-book it appears, that it then had ten wards, containing 387 houses. In William Rufus's reign it was quite destroyed by Roger de Montgomery; but Henry I. be-
flowed

Cambray
||
Cambridge.

Cambridge flowed many privileges upon it to encourage its restoration, particularly an exemption from the power of the sheriff, on condition of its paying yearly into the exchequer 100 merks (equivalent to 1000 pounds now), and from tolls, lastage, pontage, passage, and stallage, in all fairs of his dominions. It was afterwards often plundered in the barons wars by the outlaws from the isle of Ely, till Henry III. secured it by a deep ditch. In 1388, Richard II. held a parliament here. In the rebellion of Wat Tyler and Jack Straw against that prince, the university records were taken and burnt in the market-place.

The modern town is about one mile long from S. to N. and about half a mile broad in the middle, diminishing at the extremities. It has 14 parish-churches, of which two are without any towers. It contains above 1200 houses; but the private buildings are neither elegant or large, owing chiefly to their being held on college or corporation leases. It is governed by a mayor, high-steward, recorder, 13 aldermen, and 24 common-council-men, a town-clerk, &c. Its chief trade is water-carriage from hence to Downham, Lynn, Ely, &c. The Jews being encouraged to settle in England by William I. and II. were very populous here for several generations, and inhabited that street now called the *Jewry*. They had a synagogue, since converted to a parish church, called from the shape of its tower *Round Church*; though others are of opinion, that it was built by the Knights Templars, it bearing a resemblance to the temple church in London. The market-place is situated in the middle of the town, and consists of two spacious oblong squares united together; at the top of the angle stands the shire-hall, lately erected at the expence of the county. At the back of the shire-hall is the town-hall and gaol. In the market-place, fronting the shire-hall, is a remarkable handsome stone conduit, to which water is conveyed by an aqueduct, which was the benefaction of the celebrated Hobson, a carrier in the reign of James I. who was a native of this town. A fine road for the benefit of the inhabitants and students was made a few years since for 4 miles, from this town to Gogmagog-hills, pursuant to the will of Mr Wortes. The late Dr Addenbroke also left it 4000 l. towards building and furnishing an hospital for the cure of poor diseased people gratis: of which charity the master of Catharine-hall is a trustee; which hospital has been erected at the south-east end of the town. At a little distance from Benet-college is the botanic garden of 5 acres, and a large house for the use of the governors and the residence of the curator, given to the university by the late Dr Walker, who settled an estate on it towards its support; to which the late Mr Edward Betham added a very considerable benefaction. The town has fairs on June 24. and Aug. 14.

The glory of Cambridge is its university; but when it had its beginning is uncertain. At first there was no public provision for the accommodation or maintenance of the scholars; but afterwards inns began to be erected by pious persons for their reception, and in the time of Edward I. colleges began to be built and endowed. This university, not inferior to any in Christendom, consists of 12 colleges and 4 halls, which have the same privileges as the colleges. The whole body, which is commonly about 1500, enjoys very

great privileges granted by several of our sovereigns; Cambridge but it was James I. who empowered it to send two members to parliament, as the town had done from the first. The university is governed, 1. By a chancellor, who is always some nobleman, and may be changed every three years, or continued longer by the tacit consent of the university. 2. By a high-steward, chosen by the senate, and holding his place by patent from the university. 3. By a vice-chancellor, who is the head of some college or hall, and chosen yearly by the body of the university, the heads of the colleges naming two. 4. By two proctors chosen every year, according to the cycle of colleges and halls; as are two taxors, who with the proctors regulate the weights and measures, as clerks of markets. The proctors also inspect the behaviour of the scholars, who must not be out of their colleges after nine at night. Here are also 2 moderators, 2 scrutators, a commissary, public orator, 2 librarians, a register, a school-keeper, 3 esquire beadles and a yeoman beadle, 18 professors, and the caput, consisting of the vice-chancellor, a doctor of divinity, a doctor of laws, a doctor of physic, a regent, and a non-regent master of arts. Henry VI. granted it the power to print all books of any kind within itself, a privilege which Oxford had not. The senate-house of the university is an elegant building of the Corinthian order, cost near 16,000 l. building; in which on the north side is a fine statue of George I. erected in 1739 at the expence of the late Lord Townshend; opposite to this on the south side is another of George II. erected in 1765 at the expence of the late Duke of Newcastle: at the east end, on each side of the entrance, are two others; one, the late duke of Somerset, after the Vandyke taste; the other, an Italian emblematical figure of Gloria. This is allowed to be the most superb room in England, being 101 feet long, 42 broad, and 32 high; and it has a gallery which can contain 1000 persons. This building forms the north side of a quadrangle, as the schools and public library do the west, the schools being the ground floor, and the library over them surrounding a small court. North of the philosophy school is the repository of Dr Woodward's fossils, ores, shells, &c. The doctor, together with that collection and a part of his library, left a sum of money to this university for erecting a professorship for natural philosophy, with a provision of 150 l. a-year for ever. At the south-east corner of this building is an elegant geometrical stone staircase which leads to the old library, and consists of 18 classes; at the end of which is an elegant square room, in which are deposited the MSS. and a valuable cabinet of oriental books and curiosities, &c. This room opens to two other rooms, containing 26 large classes consisting of 30,000 volumes presented the university by George I. being the entire collection of Dr Moor bishop of Ely, and purchased of the doctor's executors by his majesty for 6000 guineas; before which his majesty gave the university 2000 l. to defray the expence of fitting up the apartments and erecting classes for their reception; they consist of the first editions of the Greek and Latin classics and historians, and the greatest part of the works of the first printers; large collections of prints of the greatest masters; and a valuable MS. of the Gospels and Acts of the Apostles on vellum, in Greek and Latin capitals, given the university by Theodore Beza,

Cambridge. Beza, and supposed to be as old as any MS. extant.

The other part of the library has been rebuilt in an elegant manner, and forms the west side of the intended quadrangle. The books which are contained in the last room are part of the old library augmented with a considerable number of the best modern books, several of which are presents from foreign sovereigns and eminent men. The south side of this quadrangle is designed for a building to contain the printing-office, &c. of the university, for which preparations began lately to be made by pulling down the old buildings on the spot. St Mary's church forms the east side of this quadrangle: here the university have their public sermons; and the pulpit, which stands in the centre of the church and faces the chancel, has no sounding-board. In a grand gallery over part of the chancel is a seat for the chancellor, vice-chancellor, &c. George I. when he gave the books, also established a professor of modern history and modern languages in this university, with a salary of 400l. for himself and two persons under him qualified to instruct in that branch 20 scholars, to be nominated by the king, each of which is obliged to learn two at least of the languages. A fellowship is founded at Magdalen college, appropriated to the gentlemen of Norfolk, and called *the travelling Norfolk fellowship*. All the libraries in Cambridge, except that of the king's-college, are lending libraries; and those at Oxford are studying libraries. The different colleges are as follows.

1. St Peter's, the most ancient, and the first on entering the town from London, consisting of two courts, separated by a cloister and gallery. The largest is 144 feet long, 84 broad. The buildings in this court have been lately repaired in an elegant manner. The lesser court is divided by the chapel, which is a fine old building 54 feet long, 27 broad, and 27 high. This college was founded 1257. There are three colleges in Oxford which dispute the antiquity with this. Cambridge and Oxford were universities long before they were possessed of any colleges in their own right, the students then lodging and boarding with the townsmen, and they then hired hotels for their exercises and disputations. A hotel or hall, now denominated *Pythagoras's school*, situated on the west side of the river, is one of the ancient hotels that remains undemolished, and in which Erasmus read his first Greek lectures in England. 2. Clare-hall, on the bank of the river, over which it has an elegant stone-bridge, was founded 1326, consisting of one grand court 150 feet long and 111 broad. The front of this building that faces the fields has the appearance of a palace. To this college a new chapel has been added. 3. Pembroke-hall is near St Peter's college, and was founded in 1343, consists of two courts. It has an elegant chapel built by Sir Christ. Wren. 4. Corpus Christi or Benet college, founded in 1350, has but a mean appearance, but is possessed of a remarkably large collection of valuable and curious ancient manuscripts. 5. Trinity-hall, on the north of Clare-hall, near the river, was founded in 1351; it is a small but remarkably neat building. 6. Gonvil and Caius college is near the middle of the town, north of the senate-house, and has three courts. It was founded 1348, and augmented 1557. 7. King's-college, the most noble foundation in Europe, was first endowed by Henry VI.

The old court resembles a decayed castle more than a Cambridge.

college. The new building is very magnificent, near 300 feet long. The chapel is one of the finest pieces of Gothic architecture now remaining in the world. It is 304 feet long, 73 broad on the outside and 40 within, and 91 high; and yet not a single pillar to sustain its ponderous roofs, of which it has two: the first is of stone, most curiously carved; the other of wood, covered with lead, between which is a vacancy of 10 feet. There is such a profusion of carvings both within and without as is no where to be equalled. Henry VII. enlarged it 188 feet in length, and Henry VIII. gave the elegant stalls and organ gallery, with its inimitable carvings, where are the coats of arms of that king and those of Anne Boleyn quartered. He gave also the elegant painted glass windows, which are in fine preservation, and were permitted by Cromwell to be preserved when almost every other in England was destroyed, as he had a particular regard for this university where he had his education, and for the town which he had represented in parliament. A new altar has been lately erected, which corresponds with the architecture of the building, embellished with an antique painting of Christ taking down from the cross, purchased in Italy, and presented the college by the earl of Carlisle. In this chapel are put up the Spanish colours taken at the reduction of Manilla by Colonel Draper, a member of this college. This college has an ancient stone-bridge over the Cam. 8. Queen's-college, near the river, south of King's, was founded 1448, and consists of two courts, with a fine grove and gardens on both sides of the river, connected with each other and the college by two wooden bridges, one of which is of a curious structure. 9. Catharine-hall is east of Queen's, and its principal front on the west, the most extensive and regular in the university. It contains only one court 180 feet long and 120 broad, and was founded in 1475. 10. Jesus college is at the east end of the town, surrounded by groves and gardens. The principal front faces the south 180 feet long, regularly built and fashioned; it was originally a benedictine convent, and converted to the present use 1576. 11. Christ's college is opposite to St Andrew's church, on the east side of the town; and was founded by Henry VII.'s mother in 1505. It has lately had a thorough repair, and is now a neat and beautiful structure. 12. St John's college was founded by the same lady in 1509, on the site of a dissolved priory. It consists of three courts, and has a large library filled with scarce and valuable books. To this college belongs a fine stone-bridge over the river, which leads to their grand walks. 13. Magdalen college, the only one that stands on the north side of the river, near the great bridge, consists of two courts, and was founded in 1519. 14. Trinity college is east of the river, having St John's college on the north and Caius's college and Trinity-hall on the south. It contains two large quadrangles, the first of which is 344 feet long and 280 broad. It has two noble entrances; and on the north side of it is the chapel 204 feet long, 34 broad, and 44 high. It has every grand ornament, and the much admired statue of Sir Isaac Newton, who was a student in this college. The hall is above 100 feet long, 40 broad, and 50 high. The inner court is esteemed the finest in the university, and surpasses

Cambridge. passes any in Oxford. It is very spacious, and has an elegant cloister of stone pillars, supporting grand apartments; on the west is the library, the most elegant structure of the kind in the kingdom, 190 feet long, 40 broad, and 38 high within. Its entrance is by a stair-case, the steps black marble, and the walls incrustured with ancient Roman monuments. The entrance into the library is by folding doors at the north end. Its inside appearance is inexpressibly grand, having at the south end (lately erected) a beautiful painted glass window of his present majesty in his robes; and the classes are large, beautiful, and noble, well stocked with books, manuscripts, &c. Its outside has every suitable embellishment, and was erected by Sir Christopher Wren at the expence of near 20,000*l*. Under this building is a spacious piazza of equal dimensions; out of which opens three gates to a lawn that leads to the river, over which is a new elegant cycloidal bridge of three arches, leading to extensive walks. In the middle is a remarkable vista. This college was founded on the site of two other colleges and a hall in 1546 by Henry VIII. 15. Emanuel college is at the south-east end of the town; consists of two courts, the principal of which is very neat; and was built on the site of a Dominican convent. It has been lately in a great part rebuilt and elegantly embellished. 16. Sidney-Sussex college is in Bridge-street. Its hall is elegant, but chapel remarkable only for standing north and south, as others do east and west.

CAMBRIDGESHIRE, an inland county of England, bounded on the east by Norfolk and Suffolk, on the south by Essex and Hertfordshire, on the west by Bedfordshire and Huntingdonshire, and on the north by Lincolnshire. Prior to the arrival of the Romans it was included in the antient division of the Iceni; and after their conquest in the third province of Flavia Cæsariensis, which reached from the Thames to the Humber. During the Heptarchy it belonged to the kingdom of East Angles, the sixth kindom, which began in 575, and ended in 792, having had 14 kings; and it is now included in the Norfolk circuit, the diocese of Ely, and province of Canterbury, except a small part which is in the diocese of Norwich. It is about 40 miles in length from north to south, and 25 in breadth from east to west, and is 130 miles in circumference, containing near 570,000 acres. It has about 17,400 houses, 140,000 inhabitants, is divided into 17 hundreds, in which are one city, Ely; 8 market towns, viz. Cambridge which is the shire town and a celebrated university; Caxton, Linton, Merch, Newmarket, Soham, Wisbeach, Thorney, and part of Royston; 220 villages, 64 parishes, sends 2 members to parliaments (exclusive of 2 for the town and 2 for the university), pays one part of the land tax, and provides 480 men in the militia. Its only rivers are the Cam, the Nene, and the Ouse. A considerable tract of land in this county is distinguished by the name of the *Isle of Ely*. It consists of fenny ground, divided by innumerable channels and drains; and is part of a very spacious level, containing 300,000 acres of land, extending into Norfolk, Suffolk, Huntingdonshire, and Lincolnshire. The *Isle of Ely* is the north division of the county, and extends south almost as far as Cambridge. The whole level, of which this is part, is bounded on one side by the sea, and on the others by uplands; which, taken together, forms a rude kind of fe-

micircle resembling a horse-shoe. The air is very different in different parts of the county. In the fens it is moist and foggy, and therefore not so wholesome; but in the south and east parts it is very good, these being much drier than the other: but both, by late improvements, have been rendered very fruitful, the former by draining, and the latter by cinquefoil: so that it produces plenty of corn, especially barley, saffron, and hemp, and affords the richest pastures. The rivers abound with fish, and the fens with wild fowl. The principal manufactures of the country are malt, paper, and baskets. As the above tract appears to have been dry land formerly, the great change it has undergone must have been owing either to a violent breach and inundation of the sea or to earthquakes. As the towns in and about the fens were great sufferers by the stagnation of the waters in summer, and want of provisions in winter, many attempts were made to drain them, but without success, until the time of Charles I. in which, and that of his son, the work was happily completed, and an act of parliament passed, by which a corporation was established for its preservation and government. By the same act, 83,000 acres were vested in the corporation and 10,000 in the king. In these fens are a great many decoys, in which incredible numbers of ducks, and other wild fowl, are caught during the season.

New CAMBRIDGE, a town of New England about three miles from Boston, remarkable for an university consisting of three colleges. W. Long. 70. 4. N. Lat. 42. 0.

CAMBRIDGE Manuscript, a copy of the Gospels and Acts of the Apostles in Greek and Latin. Beza found it in the monastery of Irenæus at Lyons in the year 1562, and gave it to the university of Cambridge in 1582. It is a quarto size, and written on vellum; 66 leaves of it are much torn and mutilated, ten of which are supplied by a later transcriber. Beza conjectures, that this manuscript might have existed so early as the time of Irenæus: Wetstein apprehends, that it either returned or was first brought from Egypt into France; that it is the same copy which Druthmar, an ancient expositor who lived about the year 840, had seen, and which, he observes, was ascribed to St Hilary; and that R. Stephens had given a particular account of it in his edition of the New Testament in 1550. It is usually called *Stevens's second manuscript*. Mill agrees with F. Simon in opinion, that it was written in the western part of the world by a Latin scribe, and that it is to a great degree interpolated and corrupted: he observes, that it agrees so much with the Latin Vulgate, as to afford reason for concluding, that it was corrected or formed upon a corrupt and faulty copy of that translation. From this and the Clermont copy of St Paul's Epistles, Beza published his larger Annotations in 1582.

CAMBYSES. See (*History of*) PERSIA.

CAMDEN (William), the great antiquarian, was born in London in the year 1551. His father was a native of Litchfield in Staffordshire, who settling in London, became a member of the company of painter-stainers, and lived in the Old Bailey. His mother was of the ancient family of Curwen, of Wirkington in Cumberland. He was educated first at Christ's hospital, and afterwards at St Paul's school: from thence he was sent, in 1566, to Oxford, and entered servitor of Magdalen college; but being disappointed of a de-

Cambridge,
Camden.

Camden.

my's place, he removed to Broad-gate hall, and somewhat more than two years after, to Christ-church, where he was supported by his kind friend and patron Dr Thornton. About this time he was a candidate for a fellowship of All Souls college, but lost it by the intrigues of the Popish party. In 1570, he supplicated the regents of the university to be admitted bachelor of arts; but in this also he miscarried. The following year Mr Camden came to London, where he prosecuted his favourite study of antiquity, under the patronage of Dr Goodman, dean of Westminster, by whose interest he was made second master of Westminster school in 1575. From the time of his leaving the university to this period, he took several journeys to different parts of England, with a view to make observations and collect materials for his *Britannia*, in which he was now deeply engaged. In 1581 he became intimately acquainted with the learned president Briffon, who was then in England; and in 1586 he published the first edition of his *Britannia*; a work which, though much enlarged and improved in future editions, was even then esteemed an honour to its author, and the glory of his country. In 1593 he succeeded to the head mastership of Westminster school on the resignation of Dr Grant. In this office he continued till 1597, when he was promoted to be Clarenceux king at arms. In the year 1600 Mr Camden made a tour to the north, as far as Carlisle, accompanied by his friend Mr (afterwards Sir Robert) Cotton. In 1606 he began his correspondence with the celebrated president de Thou, which continued to the death of that faithful historian. In the following year he published his last edition of the *Britannia*, which is that from which the several English translations have been made; and in 1608, he began to digest his materials for a history of the reign of queen Elizabeth. In 1609, after recovering from a dangerous illness, he retired to Chislehurst in Kent, where he continued to spend the summer months during the remainder of his life. The first part of his annals of the queen did not appear till the year 1615, and he determined that the second volume should not appear till after his death (A). The work was entirely finished in 1617; and from that time he was principally employed in collecting more materials for the further improvement of his *Britannia*. In 1622, being now upwards of 70, and finding his health decline apace, he determined to lose no time in executing his design of founding an history-lecture in the university of Oxford. His deed of gift was accordingly transmitted by his friend Mr Heather to Mr Gregory Wheare, who was, by himself, appointed his first professor. He died at Chislehurst in 1623, in the 73d year of his age; and was buried with great solemnity in Westminster-abbey in the south aisle, where a monument of white marble was erected to his memory. Camden was a man of singular modesty and integrity; profoundly learned in the history and antiquities of this kingdom, and a judicious and

conscientious historian. He was revered and esteemed by the literati of all nations, and will be ever remembered as an honour to the age and country wherein he lived. Besides the works already mentioned, he was author of an excellent Greek grammar, and of several tracts in Hearne's collection. But his great and most useful work, the *Britannia*, is that upon which his fame is chiefly built. The edition above mentioned, to which he put his last hand, was correctly printed in folio, much augmented, amended where it was necessary, and adorned with maps. It was first translated into English, and published in folio at London, in 1611, by the laborious Dr Philemon Holland, a physician of Coventry, who is thought to have consulted our author himself; and therefore great respect has been paid to the additions and explanations that occur therein, on a supposition that they may belong to Camden. But in a later edition of the same translation, published in 1636, the Doctor has taken liberties which cannot either be defended or excused. A new translation, made with the utmost fidelity from the last edition of our author's work, was published in 1695, by Edmund Gibson of Queen's College in Oxford, afterwards bishop of London; in which, besides the addition of notes, and of all that deserved to be taken notice of in Dr Holland's first edition, which, though thrown out of the text, is preserved at the bottom of the page, there are many other augmentations and improvements, all properly distinguished from the genuine work of the author, as they ought to be: and the same judicious method obtained in the next edition of the same performance, which was justly considered as the very best book of its kind that had been hitherto published. But the public has recently been put in possession of a new translation, and still more improved edition, by that learned and industrious topographer Mr Gough, under whose hands it has been enlarged to near double the size of the last of the preceding editions.

CAMEL, in zoology. See CAMELUS.

CAMEL, in merchants, a kind of machine used in Holland for raising or lifting ships, in order to bring them over the Pampus, which is at the mouth of the river Y, where the shallowness of the water hinders large ships from passing. It is also used in other places, particularly at the dock of Petersburg, the vessels built here being in their passage to Cronstadt lifted over the bar by means of camels. These machines were originally invented by the celebrated De Wit, for the purpose above mentioned; and were introduced into Russia by Peter the Great, who obtained the model of them when he worked in Holland as a common shipwright. A camel is composed of two separate parts, whose out-sides are perpendicular, and whose insides are concave, shaped so as to embrace the hull of a ship on both sides. Each part has a small cabin with sixteen pumps and ten plugs, and contain twenty men. They are braced to a ship underneath by means of cables, and entirely enclose its sides and bottom; being then towed to the bar,

Camden,
Camel.

(A) The reign of queen Elizabeth was so recent when the first volume of the Annals was published, that many of the persons concerned, or their dependents, were still living. It is no wonder, therefore, that the honest historian should offend those whose actions would not bear inquiry. Some of his enemies were clamorous and troublesome; which determined him not to publish the second volume during his life; but that posterity might be in no danger of disappointment, he deposited one copy in the Cotton library, and transmitted another to his friend Dupuy at Paris. It was first printed at Leyden in 1625.

African Camel, or Dromedary.

Bactrian Camel.

Sc. Bell. Pin. Wals. Sculptor fecit.

Camelford bar, the plugs are opened, and the water admitted until the camel links with the ship and runs a-ground. Then, the water being pumped out, the camel rises, lifts up the vessel, and the whole is towed over the bar. This machine can raise the ship eleven feet, or, in other words, make it draw eleven feet less water.

Camelus.

CAMELFORD, a borough town of Cornwall in England, consisting of about 100 houses, badly built; but the streets are broad and well paved. W. Long. 5. 4. N. Lat. 50. 40. It sends two members to parliament; and gives title of baron to Thomas Pittelder, brother of the great earl of Chatham.

CAMELLIA, in botany: A genus of the polyandria order, belonging to the monodelphia class of plants; and in the natural method ranking under the 37th order, *Columnifera*. The calyx is imbricated and polyphyllous, with the interior leaves larger than the exterior ones. Of this genus there is but one species, a native both of China and Japan. Thunberg, in his *Flora Japonica*, describes it as growing every where in the groves and gardens of Japan, where it becomes a prodigiously large and tall tree, highly esteemed by the natives for the elegance of its large and very variable blossoms, and its evergreen leaves; it is there found with single and double flowers, which also are white, red, and purple, and produced from April to October. Representations of this flower are frequently met with in Chinese paintings. With us, the *Camellia* is generally treated as a stove plant, and propagated by layers; it is sometimes placed in the greenhouse; but it appears to us to be one of the properest plants imaginable for the conservatory. At some future time it may, perhaps, not be uncommon to treat it as a *Laurus* or *Magnolia*: the high price at which it has hitherto been sold, may have prevented its being hazarded in this way. The blossoms are of a firm texture, but apt to fall off long before they have lost their brilliancy; it therefore is a practice with some to stick such deciduous blossoms on some fresh bud, where they continue to look well for a considerable time. Petiver considered this plant as a species of tea-tree; and future observations will probably confirm his conjecture.

CAMELODUM. See **CAMALODUNUM**.

CAMELOPARDALIS, in zoology, the trivial name of a species of **CERVUS**.

CAMELUS, or **CAMEL**, in zoology, a genus of quadrupeds belonging to the order of pecora. The characters of the camel are these: It has no horns; it has six fore-teeth in the under jaw; the laniarii are wide set, three in the upper, and two in the lower jaw; and there is a fissure in the upper lip, resembling a cleft in the lip of a hare. The species are:

1. The dromedarius, or Arabian camel, with one bunch or protuberance on the back. It has four callous protuberances on the fore-legs, and two on the hind ones. This species is common in Africa, and the warmer parts of Asia; not that it is spread over either of the continents. It is a common beast of burden in Egypt, and along the countries which border on the Mediterranean Sea; in the kingdom of Morocco, Sara or the Desert, and in Ethiopia: but no where south of those kingdoms. In Asia, it is equally common in Turkey and Arabia; but is scarcely seen farther north than Persia, being too tender to bear a more severe climate. India is destitute of this animal.

VOL. IV. Part I.

2. The Bactrianus, or Bactrian camel, has two bunches on the back, but is in all other respects like the preceding; of which it seems to be a mere variety, rather than a different species; and is equally adapted for riding or carrying loads. It is still found wild in the deserts of the temperate parts of Asia, particularly in those between China and India. These are larger and more generous than the domesticated race. The Bactrian camel, which is very common in Asia, is extremely hardy, and in great use among the Tartars and Mongols, as a beast of burden, from the Caspian Sea to the empire of China. It bears even so severe a climate as that of Siberia, being found about the lake Baikal, where the Burats and Mongols keep great numbers. They are far less than those which inhabit Western Tartary. Here they live during winter on willows and other trees, and are by this diet reduced very lean. They lose their hair in April, and go naked all May, amidst the frosts of that severe climate. To thrive, they must have dry ground and salt marshes. There are several varieties among the camels. The Turkman is the largest and strongest. The Arabian is hardy. What is called the Dromedary, Maihary, and Raguahl, is very swift. The common sort travel about 30 miles a day. The last, which has a less bunch, and more delicate shape, and also is much inferior in size, never carries burdens; but is used to ride on. In Arabia, they are trained for running-matches: and in many places for carrying couriers, who can go above 100 miles a day on them; and that for nine days together, over burning deserts, uninhabitable by any living creature. The African camels are the most hardy, having more distant and more dreadful deserts to pass over than any of the others, from Numidia to the kingdom of Ethiopia. In Western Tartary there is a white variety, very scarce, and sacred to the idols and priests. The Chinese have a swift variety, which they call by the expressive name of Fong Kyo Fo, or camels with feet of the wind. Fat of camels, or, as those people call it, oil of bunches, being drawn from them, is esteemed in many disorders, such as ulcers, numbness, and consumptions. This species of camel is rare in Arabia, being an exotic, and only kept by the great men.

Camels have constituted the riches of Arabia from the time of Job to the present day. The patriarch reckoned 6000 camels among his pastoral treasures, and the modern Arabs estimate their wealth by the numbers of these useful animals. Without them great part of Africa would be wretched; by them the whole commerce is carried through arid and burning tracts, impassable but by beasts which Providence formed expressly for the scorched deserts. Their soles are adapted to the sands they are to pass over, their toughness and spongy softness preventing them from cracking. Their great powers of sustaining abstinence from drinking, enables them to pass over unwatered tracts for many days, without requiring the least liquid; and their patience under hunger is such, that they will travel many days fed only with a few dates, or some small balls of bean or barley-meal, or on the miserable thorny plants they meet with in the deserts.

The Arabians regard the camel as a present from heaven, a sacred animal, without whose assistance they could neither subsist, carry on trade, nor travel. Ca-

H

mel's

Camelus.

Camelus.

mel's milk is their common food. They also eat its flesh, that of the young camel being reckoned highly savoury. Of the hair of those animals, which is fine and soft, and which is completely renewed every year, the Arabians make stuffs for clothes, and other furniture. With their camels, they not only want nothing, but have nothing to fear. In one day, they can perform a journey of fifty leagues into the desert, which cuts off every approach from their enemies. All the armies of the world would perish in pursuit of a troop of Arabs. Hence they never submit, unless from choice, to any power. With a view to his predatory expeditions, the Arab instructs, rears, and exercises his camels. A few days after their birth, he folds their limbs under their belly, forces them to remain on the ground, and, in this situation, loads them with a pretty heavy weight, which is never removed but for the purpose of replacing a greater. Instead of allowing them to feed at pleasure, and to drink when they are dry, he begins with regulating their meals, and makes them gradually travel long journeys, diminishing, at the same time, the quantity of their aliment. When they acquire some strength, they are trained to the course. He excites their emulation by the example of horses, and, in time, renders them more robust. In fine, after he is certain of the strength, fleetness, and sobriety of his camels, he loads them both with his own and their food, sets off with them, arrives unperceived at the confines of the desert, robs the first passengers he meets, pillages the solitary houses, loads his camels with the booty, and, if pursued, he is obliged to accelerate his retreat. It is on these occasions that he unfolds his own talents and those of the camels. He mounts one of the fleetest, conducts the troop, and makes them travel night and day, without, almost, either stopping, eating, or drinking; and, in this manner, he easily performs a journey of three hundred leagues in eight days. During this period of motion and fatigue, his camels are perpetually loaded, and he allows them each day, one hour only of repose, and a ball of paste. They often run in this manner nine or ten days, without finding water; and when, by chance, there is a pool at some distance, they scent the water half a league off. Thirst makes them double their pace, and they drink as much at once as serves them for the time that is past, and as much to come; for their journeys often last several weeks, and their abstinence continues an equal time.

Of all carriages, that by camels is the cheapest and most expeditious. The merchants and other passengers unite in a caravan, to prevent the insults and robberies of the Arabs. These caravans are often very numerous, and are always composed of more camels than men. Each camel is loaded in proportion to his strength; and, when overloaded, he refuses to march, and continues lying till his burden is lightened. The large camels generally carry a thousand, or even twelve hundred pounds weight, and the smallest from six to seven hundred. In these commercial travels, their march is not hastened: As the route is often seven or eight hundred leagues, their motions and journeys are regulated. They walk only, and perform about from ten to twelve leagues each day. Every night they are unloaded, and allowed to pasture at freedom. When in a rich country, or fertile meadow, they eat, in less

than an hour, as much as serves them to ruminate the whole night, and to nourish them during twenty-four hours. But they seldom meet with such pastures; neither is this delicate food necessary for them. They even seem to prefer wormwood, thistles, nettles, broom, cassia, and other prickly vegetables, to the softest herbage. As long as they find plants to browse, they easily dispense with drink. This facility of abstaining long from drink proceeds not, however, from habit alone, but is rather an effect of their structure. Independent of the four stomachs, which are common to ruminating animals, the camels have a fifth bag, which serves them as a reservoir for water. This fifth stomach is peculiar to the camel. It is so large as to contain a vast quantity of water, where it remains without corrupting, or mixing with the other aliments. When the animal is pressed with thirst, and has occasion for water to macerate his dry food in ruminating, he makes part of this water mount into his paunch, or even as high as the œsophagus, by a simple contraction of certain muscles. It is by this singular construction that the camel is enabled to pass several days without drinking, and to take at a time a prodigious quantity of water, which remains in the reservoir pure and limpid, because neither the liquors of the body, nor the juices of digestion, can mix with it. Travellers, when much oppressed with drought, are sometimes obliged to kill their camels in order to have a supply of drink from these reservoirs. These inoffensive creatures must suffer much; for they utter the most lamentable cries, especially when overloaded. But, though perpetually oppressed, their fortitude is equal to their docility. At the first signal, they bend their knees and lie down to be loaded, which saves their conductor the trouble of raising the goods to a great height. As soon as they are loaded, they rise spontaneously, and without any assistance. One of them is mounted by their conductor, who goes before, and regulates the march of all the followers. They require neither whip nor spur. But, when they begin to be tired, their courage is supported, or rather their fatigue is charmed, by singing, or by the sound of some instrument. Their conductors relieve each other in singing; and, when they want to prolong the journey, they give the animals but one hour's rest; after which, resuming their song, they proceed on their march for several hours more, and the singing is continued till they arrive at another resting place, when the camels again lie down; and their loads, by unloosing the ropes, are allowed to glide off on each side of the animals. Thus they sleep on their bellies in the middle of their baggage, which, next morning is fixed on their backs with equal quickness and facility as it had been detached the evening before.

Fatigue, hunger, thirst, and meagreness, are not the only inconveniences to which these animals are subjected: To all these evils they are prepared by castration. One male is only left for eight or ten females; and the labouring camels are generally geldings. They are unquestionably weaker than uncastrated males; but they are more tractable, and at all seasons ready for service. While the former are not only unmanageable, but almost furious, during the rutting season, which lasts forty days, and returns annually in the spring. It is then said, that they foam

Camelus.

con-

Camelus.

continually, and that one or two red vesicles, as large as a hog's bladder, issue from their mouths. In this season they eat little, attack and bite animals, and even their own masters, to whom at all other times they are very submissive. Their mode of copulating differs from that of all other quadrupeds; for the female, instead of standing, lies down on her knees, and receives the male in the same position that she reposes, or is loaded. This posture, to which the animals are early accustomed, becomes natural, since they assume it spontaneously in coition. The time of gestation is near twelve months, and, like all large quadrupeds, the females bring forth only one at a birth. Her milk is copious and thick; and, when mixed with a large quantity of water, affords an excellent nourishment to men. The females are not obliged to labour, but are allowed to pasture and produce at full liberty. The advantage derived from their produce and their milk is perhaps superior to what could be drawn from their working. In some places, however, most of the females are castrated, in order to fit them for labour; and it is alleged, that this operation, instead of diminishing, augments their strength, vigour, and plumpness. In general, the fatter camels are, they are the more capable of enduring great fatigue. Their bunches seem to proceed from a redundancy of nourishment; for, during long journeys, in which their conductor is obliged to husband their food, and where they often suffer much hunger and thirst, these bunches gradually diminish, and become so flat, that the place where they were is only perceptible by the length of the hair, which is always longer on these parts than on the rest of the back. The meagreness of the body augments in proportion as the bunches decrease. The Moors, who transport all articles of merchandise from Barbary and Numidia, as far as Æthiopia, set out with their camels well laden, which are very fat and vigorous; and bring back the same animals so meagre, that they commonly sell at a low price to the Arabs of the Desert, to be again fattened.

We are told by the ancients, that camels are in a condition for propagating at the age of three years. This assertion is suspicious; for, in three years, they have not acquired one half of their growth. The penis of the male, like that of the bull, is very long, and very slender. During erection, it stretches forward, like that of all other quadrupeds; but, in its ordinary state, the sheath is drawn backward, and the urine is discharged from between the hind legs; so that both males and females urinate in the same manner. The young camel sucks his mother twelve months; but, when meant to be trained, in order to render him strong and robust in the chace, he is allowed to suck and pasture at freedom during the first years, and is not loaded, or made to perform any labour, till he is four years old. He generally lives forty and sometimes fifty years, which duration of life is proportioned to the time of his growth. There is no foundation for what has been advanced by some authors, that he lives one hundred years.

By considering, under one point of view, all the qualities of this animal, and all the advantages derived from him, it must be acknowledged that he is the most useful creature subjected to the service of man. Gold and silk constitute not the true riches of the East.

Camelus.

The camel is the genuine treasure of Asia. He is more valuable than the elephant; for he may be said to perform an equal quantity of labour at a twentieth part of the expence. Besides, the whole species are under subjection to man, who propagates and multiplies them at pleasure. But he has no such dominion over the elephants, whom he cannot multiply, and the individuals of whom he conquers with great labour and difficulty. The camel is not only more valuable than the elephant, but is perhaps equal in utility to the horse, the ass, and the ox, when their powers are united. He carries as much as two mules; though he eats as little, and feeds upon herbs equally coarse as the ass. The female furnishes milk longer than the cow. The flesh of a young camel is as good and wholesome as veal: The Africans and Arabs fill their pots and tubs with it, which is fried with grease, and preserved in this manner during the whole year for their ordinary repasts: The hair is finer and more in request than the best wool. Even their excrements are useful: for sal ammoniac is made of their urine; and their dung, dried in the sun and pulverised, serves for litter to themselves, as well as to horses, with which people frequently travel in countries where no hay or straw can be had. In fine, their dung makes excellent fuel, which burns freely, and gives as clear and nearly as hot a flame as dry wood, which is of great use in the deserts, where not a tree is to be found, and where, for want of combustible materials, fire is as scarce as water.

3. The Glama, Llama, or South-American camel-sheep, has an almost even back, small head, fine black eyes, and very long neck, bending much, and very protuberant near the junction with the body: in a tame state, with smooth short hair; in a wild state, with long coarse hair, white, grey, and russet, disposed in spots; with a black line from the head along the top of the back to the tail, and belly white. The spotted may possibly be the tame, the last the wild, llamas. The tail is short; the height from four to four feet and a half; the length from the neck to the tail, six feet. The carcase divested of skin and offals, according to the editor of Mr Byron's voyage, weighed 200lb. In general, the shape exactly resembles a camel, only it wants the dorsal bunch. It is the camel of Peru and Chili; and, before the arrival of the Spaniards, was the only beast of burden known to the Indians. It is very mild, gentle, and tractable. Before the introduction of mules, they were used by the Indians to plough the land: at present they serve to carry burdens of about 100lb. They go with great gravity; and, like their Spanish masters, nothing can prevail upon them to change their pace. They lie down to the burden; and when wearied, no blows can provoke them to go on. Teuillee says, they are so capricious, that if struck, they instantly squat down, and nothing but caresses can make them arise. When angry, they have no other method of revenging their injuries than by spitting; and they can ejaculate their saliva to the distance of ten paces: if it falls on the skin, it raises an itching and a reddish spot. * Their flesh is eaten, and is said to be as good as mutton. The wool has a strong disagreeable scent. They are very sure-footed; therefore used to carry the Peruvian ores over the ruggedest hills and narrowest paths of the Andes. They inhabit

Camelus
||
Camera
Lucida.

inhabit that vast chain of mountains their whole length to the straits of Magellan; but except where these hills approach the sea, as in Patagonia, never appear on the coasts. Like the camel, they have powers of abstaining long from drink, sometimes for four or five days: like that animal, their food is coarse and trifling. —In a wild state, they keep in great herds in the highest and steepest parts of the hills; and while they are feeding, one keeps centry on the pinnacle of some rock: if it perceives the approach of any one, it neighs; the herd takes the alarm, and goes off with incredible speed. They outrun all dogs, so there is no other way of killing them but with the gun. They are killed for the sake of their flesh and hair; for the Indians weave the last into cloth. From the form of the parts of generation in both sexes, no animal copulates with such difficulty. It is often the labour of a day, *antequam actum ipsum venereum incipiant, et absolvant.*

4. The Pacos, or sheep of Chili, has no bunch on the back. It is covered with a fine valuable wool, which is of a rose red colour on the back of the animal, and white on the belly. They are of the same nature with the preceding; inhabit the same places, but are more capable of supporting the rigour of frost and snow: they live in vast herds; are very timid, and excessively swift. The Indians take the pacos in a strange manner: they tie cords with bits of cloth or wool hanging to them, above three or four feet from the ground, cross the narrow passes of the mountains, then drive those animals towards them, which are so terrified by the flutter of the rags, as not to dare to pass, but, huddling together, give the hunters an opportunity to kill with their slings as many as they please. The tame ones will carry from 50 to 75 lb.; but are kept principally for the sake of the wool and the flesh, which is exceedingly well tasted.

CAMERA ÆOLIA, a contrivance for blowing the fire, for the fusion of ores, without bellows; by means of water falling through a funnel into a close vessel, which sends from it so much air or vapour as continually blows the fire: if there be the space of another vessel for it to expatiate in by the way, it there lets fall its humidity, which otherwise might hinder the work. This contrivance was named *camera Æolia* by Kircher.

CAMERA Lucida, a contrivance of Dr Hook for making the image of any thing appear on a wall in a light room, either by day or night. Opposite to the place or wall where the appearance is to be, make a hole of at least a foot in diameter, or if there be a high window with a casement of this dimension in it, this will do much better without such hole or casement opened. At a convenient distance, to prevent its being perceived by the company in the room, place the object or picture intended to be represented, but in an inverted situation. If the picture be transparent, reflect the sun's rays by means of a looking-glass, so as that they may pass through it towards the place of representation; and to prevent any rays from passing aside it, let the picture be encompassed with some board or cloth. If the object be a statue, or a living creature, it must be much enlightened by casting the sun's rays on it, either by reflection, refraction, or both. Between this object and the place of representation put a broad convex glass, ground to such a convexity as

that it may represent the object distinctly in such place. The nearer this is situated to the object, the more will the image be magnified on the wall, and the further the less; such diversity depending on the difference of the spheres of the glasses. If the object cannot be conveniently inverted, there must be two large glasses of proper spheres, situated at suitable distances, easily found by trial, to make the representations erect. This whole apparatus of object, glasses, &c. with the persons employed in the management of them, are to be placed without the window or hole, so that they may not be perceived by the spectators in the room, and the operation itself will be easily performed. Phil. Transf. N^o 38. p. 741, seq.

CAMERA Obscura, or Dark Chamber, in Optics, a machine, or apparatus, representing an artificial eye; whereon the images of external objects, received thro' a double convex glass, are exhibited distinctly, and in their native colours, on a white matter placed within the machine, in the focus of the glass.

The first invention of this instrument is ascribed to Baptista Porta. See his *Magia Naturalis*, lib. xvii. cap. 6. first published at Franckfort about the year 1589 or 1591; the first four books of this work were published at Antwerp in 1560.

The *camera obscura* affords very diverting spectacles; both by exhibiting images perfectly like their objects, and each clothed in their native colours; and by expressing, at the same time, all their motions; which latter no other art can imitate. By means of this instrument, a person unacquainted with designing will be able to delineate objects with the greatest accuracy and justness, and another well versed in painting will find many things herein to perfect his art. See the construction under DIOPTRICS.

CAMERARIA, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 30th order, *Contortæ*. There are two horizontal follicles at the base of the seed-case. The seeds are inserted into a proper membrane. Of this there are two species; the *latifolia*, and the *angustifolia*. The first is a native of the island of Cuba, and rises with a shrubby stalk to the height of 10 or 12 feet, dividing into several branches, garnished with roundish pointed leaves placed opposite. The flowers are produced at the end of the branches in loose clusters, which have long tubes enlarging gradually upward, and at the top are cut into five segments, broad at their base, but ending in sharp points; the flower is of a yellowish white colour. The second sort has an irregular shrubby stalk, which rises about eight feet high, sending out many branches which are garnished with very narrow thin leaves placed opposite at each joint. The flowers are produced scatteringly at the end of the branches, which are shaped like those of the former sort, but smaller. It is a native of Jamaica. Both these plants abound with an acrid milky juice like the spurge. They are propagated by seeds, which must be procured from the places of their growth. They may also be propagated by cuttings planted in a hot-bed during the summer-months: they must have a bark-stove, for they are very tender plants; but in warm weather they must have plenty of air.

CAMERARIUS (Joachim), one of the most learned

Camera
Obscura
||

rius.

Camera-
rius
||
Cameronians.

ed writers of his time, was born in 1500, at Bamberg, a city of Franconia; and obtained great reputation by his writings. He translated into Latin Herodotus, Demosthenes, Xenophon, Euclid, Homer, Theocritus, Sophocles, Lucian, Theodoret, Nicephorus, &c. He published a catalogue of the bishops of the principal sees; Greek epistles; Accounts of his journeys, in Latin verse; a Commentary on Plautus; the Lives of Helius Eobanus Hessius, and Philip Melancthon, &c. He died in 1574.

CAMERARIUS (Joachim), son of the former, and a learned physician, was born at Nuremberg in 1534. After having finished his studies in Germany, he went into Italy, where he obtained the esteem of the learned. At his return he was courted by several princes to live with them; but he was too much devoted to books, and the study of chemistry and botany, to comply. He wrote an *hortus medicus*, and several other works. He died in 1598.

CAMERATED, among builders, the same with vaulted or arched.

CAMERET-BAY, in the province of Brittany in France, forms the harbour of Brest. See BREST.

CAMERINO, a town of the ecclesiastical state in Italy, situated in E. Long. 13. 7. N. Lat. 45. 5.

CAMERLINGO, according to Ducange, signified formerly the pope's or emperor's treasure: at present, *camerlingo* is no where used but at Rome, where it denotes the cardinal who governs the ecclesiastical state and administers justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal *camerlingo* publishes edicts, coins money, and exerts every other prerogative of a sovereign prince; he has under him a treasurer-general, auditor-general, and 12 prelates called *clerks of the chamber*.

CAMERON (John), one of the most famous divines among the Protestants of France in the 17th century, was born at Glasgow in Scotland, where he taught the Greek tongue; and having read lectures upon that language for about a year, travelled, and became professor at several universities, and minister at Bourdeaux. He published, 1. Theological lectures; 2. *Icon Johannis Cameronis*; and some miscellaneous pieces. He died in 1625, aged 60.

CAMERONIANS, a sect or party in Scotland, who separated from the Presbyterians in 1666, and continued to hold their religious assemblies in the fields.

The Cameronians took their denomination from Richard Cameron, a famous field-preacher, who, refusing to accept the indulgence to tender consciences, granted by king Charles II. as such an acceptance seemed an acknowledgment of the king's supremacy, and that he had before a right to silence them, made a defection from his brethren, and even headed a rebellion, in which he was killed. His followers were never entirely reduced till the Revolution, when they voluntarily submitted to king William.

The Cameronians adhered rigidly to the form of government established in 1648.

CAMERONIANS, or *Cameronites*, is also the denomination of a party of Calvinists in France, who asserted that the will of man is only determined by the practi-

cal judgment of the mind; that the cause of mens doing good or evil proceeds from the knowledge which God infuses into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind. They had this name from John Cameron, a famous professor, first at Glasgow, where he was born, in 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which last place he broached his new doctrine of grace and free-will, which was formed by Amyraut, Cappel, Bouchart, Daille, and others of the more learned among the reformed ministers, who judged Calvin's doctrines on these points too harsh. The Cameronians are a sort of mitigated Calvinists, and approach to the opinion of the Armenians. They are also called *Universalists*, as holding the universality of Christ's death; and sometimes *Amyraldists*. The rigid adherents to the synod of Dort accused them of Pelagianism, and even of Manicheism. The controversy between the parties was carried on with a zeal and subtilty scarce conceivable; yet all the question between them was only, Whether the will of man is determined by the immediate action of God upon it, or by the intervention of a knowledge which God impresses into the mind? The synod of Dort had defined that God not only illuminates the understanding, but gives motion to the will by making an internal change therein. Cameron only admitted the illumination, whereby the mind is morally moved, and explained the sentiment of the synod of Dort so as to make the two opinions consistent.

CAMES, a name given to the small slender rods of cast-lead, of which the glaziers make their turned lead.

Their lead being cast into slender rods of twelve or fourteen inches long each, is called the *came*; sometimes also they call each of these rods a *came*, which being afterwards drawn through their vice, makes their turned lead.

CAMILLUS (Marcus Furius) was the first who rendered the family of *Furius* illustrious. He triumphed four times, was five times dictator, and was honoured with the title of the *second founder of Rome*. In a word, he acquired all the glory a man can gain in his own country. Lucius Apuleius, one of the tribunes, prosecuted him to make him give an account of the spoils taken at Veii. Camillus anticipated judgment, and banished himself voluntarily. During his banishment, instead of rejoicing at the devastation of Rome by the Gauls, he exerted all his wisdom and bravery to drive away the enemy; and yet kept with the utmost strictness the sacred law of Rome, in refusing to accept the command which several private persons offered him. The Romans, who were besieged in the capitol, created him dictator in the year 363; in which office he acted with so much bravery and conduct, that he entirely drove the army of the Gauls out of the territories of the commonwealth. He died in the 81st year of his age, 365 years before the Christian era.

CAMILLI and CAMILLÆ, in antiquity, boys and girls of ingenious birth, who ministered in the sacrifices of the gods; and especially those who attended the *flamen dialis*, or priest of Jupiter. The word seems borrowed from the language of the ancient Etrurians, where

Cames
||
Camilli.

Caminha
||
Camoens.

where it signified minister, and was changed from *east-millus*. The Tuscans also gave the appellation *Camil-lus* to Mercury, in quality of minister of the gods.

CAMINHA, a maritime town of Portugal, in the province of Entre-Duero e-Minho, with the title of a duchy. It is situated at the mouth of the river Minho, in W. Long. 9. 15. N. Lat. 41. 44.

CAMIS, or KAMIS, in the *Japanese Theology*, denote deified souls of ancient heroes, who are supposed still to interest themselves in the welfare of the people over whom they anciently commanded.

The *camis* answer to the heroes in the ancient Greek and Roman theology, and are venerated like the saints in the modern Romish church.

Besides the heroes or *camis* beatified by the consent of antiquity, the *mikaddos*, or pontiffs, have deified many others, and continue still to grant the apotheosis to new worthies; so that they swarm with *camis*: the principal one is *Tensio Dai Sin*, the common father of Japan, to whom are paid devotions and pilgrimages extraordinary.

CAMISADE, in the art of war, an attack by surprise in the night, or at the break of day, when the enemy is supposed to be a-bed. The word is said to have taken its rise from an attack of this kind; wherein, as a badge or signal to know one another by, they bore a shift, in French called *chemise*, or *camise*, over their arms.

CAMISARDS, a name given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms in their own defence, in 1688.

CAMLETINE, a slight stuff, made of hair and coarse silk, in the manner of camblet. It is now out of fashion.

CAMMA, and GOBBI, two provinces of the kingdom of Loango in Africa. The inhabitants are continually at war with each other. The weapons they formerly used in their wars were the short pike, bows and arrows, sword and dagger; but since the Europeans have become acquainted with that coast, they have supplied them with fire-arms. The chief town of Gobbi lies about a day's journey from the sea. Their rivers abound with a variety of fish; but are infested with sea-horses, which do great mischief both by land and water. The principal commerce with the natives is in logwood, elephants teeth, and tails, the hair of which is highly valued, and used for several curious purposes.

CAMMIN, a maritime town of Germany, in Brandenburg Pomerania, situated in E. Long. 15°. N. Lat. 54°.

CAMOENS (Louis de), a famous Portuguese poet, the honour of whose birth is claimed by different cities. But according to N. Antonio, and Manuel Correa, his intimate friend, this event happened at Lisbon in 1517. His family was of considerable note, and originally Spanish. In 1370, Vasco Perez de Caamans, disgusted at the court of Castile, fled to that of Lisbon, where king Ferdinand immediately admitted him into his council, and gave him the lordships of Sardoal, Punete, Marano, Amendo, and other considerable lands; a certain proof of the eminence of his rank and abilities. In the war for the succession, which broke out on the death of Ferdinand, Camoens sided with the

king of Castile, and was killed in the battle of Aljubarota. But though John I. the victor, seized a great part of his estate, his widow, the daughter of Gonfalo Tereyro, grand master of the order of Christ, and general of the Portuguese army, was not reduced beneath her rank. She had three sons who took the name of *Camoens*. The family of the eldest intermarried with the first nobility of Portugal; and even, according to Castera, with the blood royal. But the family of the second brother, whose fortune was slender, had the superior honour to produce the author of the *Lusiad*.

Early in his life the misfortunes of the poet began. In his infancy, Simon Vaz de Camoens, his father, commander of a vessel, was shipwrecked at Goa, where, with his life, the greatest part of his fortune was lost. His mother, however, Anne de Macedo of Santarene, provided for the education of her son Louis at the university of Coimbra. What he acquired there, his works discover; an intimacy with the classics, equal to that of a Scaliger, but directed by the taste of a Milton or a Pope.

When he left the university, he appeared at court. He was handsome; had speaking eyes, it is said; and the finest complexion. Certain it is, however, he was a polished scholar, which, added to the natural ardour and gay vivacity of his disposition, rendered him an accomplished gentleman. Courts are the scenes of intrigue; and intrigue was fashionable at Lisbon. But the particulars of the amours of Camoens rest unknown. This only appears: he had aspired above his rank, for he was banished from the court; and in several of his sonnets he ascribes this misfortune to love.

He now retired to his mother's friends at Santarene. Here he renewed his studies, and began his poem on the discovery of India. John III. at this time prepared an armament against Africa. Camoens, tired of his inactive obscure life, went to Ceuta in this expedition, and greatly distinguished his valour in several rencounters. In a naval engagement with the Moors in the straits of Gibraltar, in the conflict of boarding, he was among the foremost, and lost his right eye. Yet neither hurry of actual service nor the dissipation of the camp could stifle his genius. He continued his *Lusiadas*, and several of his most beautiful sonnets were written in Africa, while, as he expressed it,

One hand the pen, and one the sword, employ'd.

The fame of his valour had now reached the court, and he obtained permission to return to Lisbon. But, while he solicited an establishment which he had merited in the ranks of battle, the malignity of evil tongues, as he calls it in one of his letters, was injuriously poured upon him. Though the bloom of his early youth was effaced by several years residence under the scorching heavens of Africa, and though altered by the loss of an eye, his presence gave uneasiness to the gentlemen of some families of the first rank where he had formerly visited. Jealousy is the characteristic of the Spanish and Portuguese; its resentment knows no bounds, and Camoens now found it prudent to banish himself from his native country. Accordingly, in 1553, he sailed for India, with a resolution never to return. As the ship left the Tagus, he exclaimed, in the words of the sepulchral monument of Scipio Africanus, *Ingrata patria, non possidebis ossa mea!* "Ungrateful

Camoens

Camoens. ful country, thou shalt not possess my bones!" But he knew not what evils in the East would awake the remembrance of his native fields.

When Camoens arrived in India, an expedition was ready to sail to revenge the king of Cochin on the king of Pimenta. Without any rest on shore after his long voyage, he joined this armament, and in the conquest of the Alagada islands displayed his usual bravery.

In the year following, he attended Manuel de Vafconcello in an expedition to the Red Sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined in the fleet or camp. He visited Mount Felex and the adjacent inhospitable regions of Africa, which he so strongly pictures in the *Lusiad*, and in one of his little pieces where he laments the absence of his mistress.

When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his Epic Poem. But this serenity was interrupted, perhaps by his own imprudence. He wrote some satires which gave offence; and, by order of the viceroy Francisco Barreto, he was banished to China.

The accomplishments and manners of Camoens soon found him friends, though under the disgrace of banishment. He was appointed commissary of the defunct in the island of Macao, a Portuguese settlement in the bay of Canton. Here he continued his *Lusiad*; and here also, after five years residence, he acquired a fortune, though small, yet equal to his wishes. Don Constantine de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulph near the mouth of the river Mehon on the coast of China. All he had acquired was lost in the waves: his poems, which he held in one hand, while he swam with the other, were all he found himself possessed of when he stood friendless on the unknown shore. But the natives gave him a most humane reception: this he has immortalised in the prophetic song in the tenth *Lusiad*; and in the seventh, he tells us, that here he lost the wealth which satisfied his wishes.

Agora da esperança já adquirida, &c.

Now blest with all the wealth fond hope could crave,
Soon I beheld that wealth beneath the wave

For ever lost;—

My life, like Judah's heaven-doom'd king of yore,
By miracle prolong'd—

On the banks of the Mehon, he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time, till an opportunity offered to carry him to Goa. When he arrived at that city, Don Constantine de Braganza, the viceroy, whose characteristic was politeness, admitted him into intimate friendship, and Camoens was happy till count Redondo assumed the government. Those who had formerly procured the banishment of the satirist, were silent while Constantine was in power; but now they exerted all their arts against him. Redondo, when he entered on office, pretended to be the friend of Camoens; yet, with all that unfeeling indifference with which he made his most

horrible witticism on the Zamorim, he suffered the innocent man to be thrown into the common prison. After all the delay of bringing witnesses, Camoens, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy and reproach. But Camoens had some creditors; and these detained him in prison a considerable time, till the gentlemen of Goa began to be ashamed that a man of his singular merit should experience such treatment among them. He was set at liberty; and again he assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, appointed governor of the fort at Sofala, by high promises, allured the poet to attend him thither. The governor of a distant fort, in a barbarous country, shares in some measure the fate of an exile. Yet, though the only motive of Barreto was, in this unpleasant situation, to retain the conversation of Camoens at his table, it was his least care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But this the governor ungenerously endeavoured to prevent, and charged him with a debt for board. Anthony de Cabra, however, and Hector de Sylveira, paid the demand; and Camoens, says Faria, and the honour of Barreto, were sold together.

After an absence of 16 years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the pestilence then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his *Lusiad*, which, in the opening of the first book, in a most elegant turn of compliment, he addressed to his prince, king Sebastian, then in his 18th year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar.

Though the great patron of one species of literature, a species the reverse of that of Camoens, certain it is, that the author of the *Lusiad* was utterly neglected by Henry, under whose inglorious reign he died in all the misery of poverty. By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which these houses provide. He had a black servant, who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, saved his master's life in the unhappy shipwreck where he lost his effects, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to erect the spirit of a downward age. To the eye of a careful observer, the fate of Camoens throws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same degenerated spirit, which suffered Camoens to depend on his share of the alms begged in the streets by his old hoary servant,

Camoens.

Camomile,
Camp.

vant, the same spirit which caused this, sunk the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which hastened his exit. In one of his letters he has these remarkable words: *Em fim accaberey a vida, e verram todos que fuy efcoada a minho patria, &c.* "I am ending the course of my life, the world will witness how I have loved my country. I have returned, not only to die in her bosom, but to die with her."

In this unhappy situation, in 1579, in his 62d year, the year after the fatal defeat of Don Sebastian, died Louis de Camoens, the greatest literary genius ever produced by Portugal; in martial courage and spirit of honour, nothing inferior to her greatest heroes. And in a manner suitable to the poverty in which he died, was he buried.

CAMOMILE, in botany. See ANTHEMIS.

CAMP, the ground on which an army pitch their tents. It is marked out by the quarter-master general, who appoints every regiment their ground.

The chief advantages to be minded in chusing a camp for an army, are, to have it near the water, in a country of forage, where the soldiers may find wood for dressing their victuals; that it have a free communication with garrisons, and with a country from whence it may be supplied with provisions; and, if possible, that it be situated on a rising ground, in a dry gravelly soil. Besides, the advantages of the ground ought to be considered, as marshes, woods, rivers, and inclosures; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel about 500 yards distance; the horse and dragoons, on the wings, and the foot, in the centre: sometimes a body of two, three, or four brigades is encamped behind the two lines, and is called the *body of reserve*. The artillery and bread-waggons are generally encamped in the rear of the two lines. A battalion of foot is allowed 80 or 100 paces for its camp; and 30 or 40 for an interval betwixt one battalion and another. A squadron of horse is allowed 30 for its camp, and 30 for an interval, and more if the ground will allow it.

Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers; because, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off the moist and putrid exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close beset with trees; for then the air is not only moist and hurtful in itself, but by stagnating becomes more susceptible of corruption. However, let the situation of camps be ever so good, they are frequently rendered infectious by the putrid effluvia of rotten straw, and the privies of the army; more especially if the bloody flux prevails, in which case the best method of preventing a general infection, is to leave the ground with the privies, foul straw, and other filth of the camp, behind. This must be frequently done, if consistent with the military operations: but when these render it improper to change the ground often, the privies should be made deeper than usual, and once a-day

Nº 62.

a thick layer of earth thrown into them till the pits are near full; and then they are to be well covered, and supplied by others. It may also be a proper caution to order the pits to be made either in the front or the rear, as the then stationary winds may best carry off their effluvia from the camp. Moreover, it will be necessary to change the straw frequently, as being not only apt to rot, but to retain the infectious steams of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an inclosure of the height of 10 hands-breadth. It made a square of 12 miles in compass about the tabernacle; and within this was another, called the *Levites camp*.

The Greeks had also their camps, fortified with gates and ditches. The Lacedæmonians made their camp of a round figure, looking upon that as the most perfect and defensible of any form: we are not, however, to imagine, that they thought this form so essential to a camp, as never to be dispensed with when the circumstances of the place require it. Of the rest of the Grecian camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The figure of the Roman camp was a square divided into two principal parts: in the upper parts were the general's pavilion, or prætorium, and the tent of the chief officers; in the lower, those of inferior degree were placed. On one side of the prætorium stood the quæstorium, or apartment of the treasurer of the army; and near this the forum, both for a market-place and the assembling of councils. On the other side of the prætorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside of the tribunes were the præfecti of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati, then those of the extraordinarii and ablecti equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called *principia*, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse; next to them were quartered the triarii; then the principes, and close by them the hastati; afterwards the foreign horse, and lastly the foreign foot. They fortified their camp with a ditch and parapet, which they termed *fossa* and *vallum*; in the latter some distinguish two parts, viz. the *agger* or earth, and the *fudes* or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the tents themselves formed of the same matter.

In the front of the Turkish camp are quartered the janizaries and other foot, whose tents encompass their aga: in the rear are the quarters of the spahis and other horsemen. The body of the camp is possessed by the stately tents or pavilions of the vizer or general, rais effendi or chancellor, kahija or steward, the testerdar bashaw or lord treasurer, and kapislar kahiafee or master

Camp.

master of the ceremonies. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafna or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent *lailac*, the place where the courts of justice are held; it being the disposition of this that is to regulate all the rest.

The Arabs still live in camps, as the ancient Scenites did. The camp of the Assyne Emir, or king of the country about Tadmor, is described by a traveller who viewed it, as spread over a very large plain, and possessing so vast a space, that though he had the advantage of a rising ground, he could not see the utmost extent of it. His own tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of hair-cloth.

CAMP, is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade with them. In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their warehouses and shops there, but also live in these camps with their whole families. The Europeans, however, are so far indulged, that at Siam, and almost every where else, they may live either in the cities or suburbs, as they shall judge most convenient.

CAMP fight, or KAMP fight, in law writers, denotes the trial of a cause by duel, or a legal combat of two champions in the field, for decision of some controversy.

In the trial by camp fight, the accuser was, with the peril of his own body, to prove the accused guilty; and by offering him his glove, to challenge him to this trial, which the other must either accept of, or acknowledge himself guilty of the crime whereof he was accused.

If it were a crime deserving death, the camp fight was for life and death: if the offence deserved only imprisonment, the camp fight was accomplished when one combatant had subdued the other, so as either to make him yield or take him prisoner. The accused had liberty to choose another to fight in his stead, but the accuser was obliged to perform it in his own person, and with equality of weapons. No women were permitted to be spectators, nor men under the age of thirteen. The priest and the people who looked on, were engaged silently in prayer, that the victory might fall to him who had right. None might cry, shriek, or give the least sign; which in some places was executed with so much strictness, that the executioner stood ready with an axe to cut off the right hand or foot of the party that should offend herein.

He that, being wounded, yielded himself, was at the other's mercy either to be killed or suffered to live. But if life were granted him, he was declared infamous by the judge, and disabled from ever bearing arms, or riding on horseback.

CAMPAGNA. See CAMPANIA.

CAMPAIGN, in the art of war, denotes the space of time that an army keeps the field, or is encamped.—The beginning of every campaign is considerably more unhealthy than if the men were to remain in quarters. After the first fortnight or three weeks encampment,

VOL. IV. Part. I.

the sickness decreases daily; the most infirm being by that time in the hospitals, and the weather daily growing warmer. This healthy state continues throughout the summer, unless the men get wet clothes or wet beds; in which case, a greater or less degree of the dysentery will appear in proportion to the preceding heats. But the most sickly part of the campaign begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dews: then, and not sooner, the dysentery prevails; and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the rest of the campaign, and never entirely ceases, even in winter-quarters, till the frosts begin. At the beginning of a campaign the sickness is so uniform, that the number may be nearly predicted; but for the rest of the season, as the diseases are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a campaign, if protracted till the beginning of a campaign, is attended with more sickness than the first two months encampment: so that it is better to take the field a fortnight sooner, in order to return into winter-quarters so much the earlier. As to winter expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions. Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

CAMPANACEÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are the following genera, viz. convolvulus, ipomœa, polemonium, campanula, roella, viola, &c. * See Botany, p. 462.

CAMPANELLA (Thomas,) a famous Italian philosopher, born at Stilo in Calabria, in 1568. He distinguished himself by his early proficiency in learning; for at the age of 13 he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. In order to arrive at truth, he shook off the yoke of authority: by which means the novelty of some of his opinions exposed him to many inconveniences; for at Naples he was thrown into prison, in which he remained 27 years, and during this confinement wrote his famous work entitled *Atheismus triumphatus*. Being at length set at liberty, he went to Paris, where he was graciously received by Louis XIII. and cardinal Richelieu; the latter procured him a pension of 2000 livres, and often consulted him on the affairs of Italy. Campanella passed the remainder of his days in a monastery of Dominicans at Paris, and died in 1639.

CAMPANI (Matthew) of Spoleto, curate at Rome, wrote a curious treatise on the art of cutting glasses for spectacles, and made several improvements in optics, assisted by his brother and pupil Joseph. He died after 1678.

CAMPANIA, a town of Italy, in the kingdom of Naples, and in the farther principato, with a bishop's see. E. Long. 15. 30. N. Lat. 40. 40.

CAMPANIA or *Campagna di Roma*, anciently Latium, a province of Italy, bounded on the west by the Tiber

Campania. Tiber and the sea, on the south-west by the sea, on the south by Terra di Lavoro, on the east by Abruzzo, and on the north by Sabina. Though the soil is good, it produces little or nothing, on account of the heavy duties on corn; and though the waters are good, the air is unwholesome. It is subject to the Pope, and is about 60 miles in length on the Mediterranean sea.

It hath been generally thought that the air of this country hath something in it peculiarly noxious during the summer-time; but Mr Condamine is of opinion that it is not more unhealthy than any other marshy country. His account follows. "It was after the invasion of the Goths in the fifth and sixth centuries that this corruption of the air began to manifest itself. The bed of the Tiber being covered by the accumulated ruins of the edifices of ancient Rome, could not but raise itself considerably. But what permits us not to doubt of this fact is, that the ancient and well-preserved pavement of the Pantheon and its portico is overflowed every winter; that the water even rises there sometimes to the height of eight or ten feet; and that it is not possible to suppose that the ancient Romans should have built a temple in a place so low as to be covered with the waters of the Tiber on the least inundation. It is evident, then, that the level of the bed of this river is raised several feet; which could not have happened without forming there a kind of dikes or bars. The choking up of its canal necessarily occasioned the overflow and reflux of its waters in such places as till then had not been subject to inundations: to these overflows of the Tiber were added all the waters that escaped out of the ancient aqueducts, the ruins of which are still to be seen, and which were entirely broken and destroyed by Totila. What need, therefore, of any thing more to infect the air, in a hot climate, than the exhalations of such a mass of stagnating waters, deprived of any discharge, and become the receptacle of a thousand impurities, as well as the grave of several millions both of men and animals? The evil could not but increase from the same causes while Rome was exposed to the incursions and devastations of the Lombards, the Normans, and the Saracens, which lasted for several centuries. The air was become so infectious there at the beginning of the 13th century, that Pope Innocent III. wrote, that few people at Rome arrived to the age of forty years, and that nothing was more uncommon there than to see a person of sixty. A very short time after, the popes transferred the seat of their residence to Avignon: during the seventy-two years they remained there, Rome became a desert; the monasteries in it were converted into stables; and Gregory XI. on his return to Rome, in 1376, hardly counted there 30,000 inhabitants. At his death began the troubles of the great schism in the west, which continued for upwards of 50 years. Martin V. in whom this schism ended in the year 1429, and his first successors, were able to make but feeble efforts against so inveterate an evil. It was not till the beginning of the 16th century that Leo X. under whom Rome began to resume her wonted splendor, gave himself some trouble about re-establishing the salubrity of the air: but the city, being shortly after besieged twice successively by the emperor Charles V. saw itself plunged again into all its old calamities; and from 85,000 inhabitants, which it contained under Leo X. it was reduced under

Clement VIII. to 32,000. In short, it is only since the time of Pius V. and Sextus V. at the end of the 16th century, that the popes have constantly employed the necessary methods for purifying the air of Rome and its environs, by procuring proper discharges for the waters, drying up the humid and marshy grounds, and covering the banks of the Tiber and other places reputed uninhabitable with superb edifices. Since that time a person may dwell at Rome, and go in or out of it at all seasons of the year. At the beginning, however, of the present century, they were still afraid to lie out of the city in summer, when they had resided there; as they were also to return to it, when once they had quitted it. They never ventured to sleep at Rome, even in broad day, in any other house than their own. They are greatly relaxed at present from these ancient scruples: I have seen cardinals, in the months of July and August, go from Rome to lie at Frascati, Tivoli, Albano, &c. and return the next or the following days to the city, without any detriment to their health: I have myself tried all these experiments, without suffering the least inconvenience from them: we have even seen, in the last war in Italy, two armies encamped under the walls of Rome at the time when the heats were most violent. Yet, notwithstanding all this, the greater part of the country people dare not still venture to lie during that season of the year, nor even as much as sleep in a carriage, in any part of the territory comprehended under the name of the *Campagna of Rome*."

CAMPANIFORM, or CAMPANULATED, an appellation given to flowers resembling a bell.

CAMPANINI, a name given to an Italian marble dug out of the mountains of Carrara, because, when it is worked, it sounds like a bell.

CAMPANULA, or BELL-FLOWER; A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 29th order, *Campanaceæ*. The corolla is campanulated, with its fundus closed up by the valves that support the stamina; the stigma is trifid; the capsule inferior, or below the receptacle of the flower, opening and emitting the seeds by lateral pores.

Species. Of this genus there are no fewer than 41 species enumerated by botanical writers; but the following are the most worthy of attention. 1. The pyramidalis hath thick tuberous roots filled with a milky juice; it sends out strong, smooth, upright stalks, which rise to the height of four feet, garnished with smooth oblong leaves a little indented at the edges. The flowers are produced from the side of the stalks, and are regularly set on for more than half their length, forming a sort of pyramid; these are large, open, and shaped like a bell. The most common colour of the flowers is blue, though some are white, but the former are most esteemed. 2. The decurrens, or peach-leaved bell-flower, is a native of the northern parts of Europe: of this there are some with white, and some with blue flowers, and some with double flowers of both colours. These last have of late been propagated in such abundance as to have almost banished from the gardens those with single flowers. 3. The medium, commonly called *Canterbury bell-flower*, is a biennial plant, which perishes soon after it has ripened its seeds. It grows naturally in the woods of Italy and Austria; but is cul-

Campani-
form
||
Campanula

Campanula, cultivated in the British gardens for the beauty of its flowers, which are blue, purple, white, and striped, with double flowers of all the colours. This species hath oblong, rough, hairy, leaves, serrated on their edges: from the centre of these rises a stiff, hairy, furrowed stalk, about two feet high, sending out several lateral branches, garnished with long, narrow, hairy leaves sawed on their edges. From the setting on of these leaves proceed the footstalks of the flower; those which are on the lower part of the stalk and branches diminishing gradually in their length upward, and thereby forming a sort of pyramid. The flowers of this kind are very large, so make a fine appearance. The seeds ripen in September, and the plants decay soon after.

4. The trachelium, with nettle leaves, hath a perennial root, which sends up several stiff hairy stalks having two ribs or angles. These put out a few short side-branches, garnished with oblong hairy leaves deeply sawed on their edges. Toward the upper part of the stalks, the flowers come out alternately upon short trifid foot-stalks having hairy empalements. The colours of the flowers are a deep and a pale blue and white, with double flowers of the same; the double-flowered kind only merit a place in gardens.

5. The latifolia, or greatest bell-flower, hath a perennial root, composed of many fleshy fibres that abound with a milky juice. From these arise several strong, round single stalks, which never put out branches, but are garnished with oval spear-shaped leaves slightly indented on their edges. Towards the upper part of the stalk the flowers come out singly upon short foot-stalks; their colours are blue, purple, and white.

6. The rapunculus, or rampion, hath roundish fleshy roots, which are eatable, and much cultivated in France for sallads; some years past it was cultivated in the English gardens for the same purpose, but is now generally neglected. It is a native of Britain; but the roots of the wild sort never grow to half the size of those which are cultivated.

7. The speculum, with yellow eye-bright leaves, is an annual plant with slender stalks rising a foot high, branching out on every side, and garnished with oblong leaves a little curled on their edges; from the wings of the leaves come out the flowers sitting close to the stalks, which are of a beautiful purple inclining to a violet colour. In the evening, they contract and fold into a pentagonal figure; from whence it is by some called *viola pentagonia*, or *five-cornered violet*.

8. The hybrida, or common Venus looking-glass. This seldom rises more than six inches high, with a stalk branching from the bottom upward, and garnished with oval leaves sitting close to the stalks, from the base of which the branches are produced, which are terminated by flowers very like the former sort. This was formerly cultivated in the gardens: but since the former kind hath been introduced, it hath almost supplanted this; for the other is a much taller plant, and the flowers larger, though of a less beautiful colour.

9. The canariensis, with an orach leaf and tuberous root, is a native of the Canary islands. It hath a thick fleshy root of an irregular form; sometimes running downward like a parsnip, at other times dividing into several knobs near the top; and when any part of the root is broken, there issues out a milky juice at the wound. From the head or crown of the root arise one, two, three, or more stalks, in propor-

tion to the size of the root; but that in the centre is generally larger, and rises higher, than the others. These stalks are very tender, round, and of a pale green; their joints are far distant from each other; and when the roots are strong, the stalks will rise to ten feet high, sending out several lateral branches. At each joint they are garnished with two, three, or four spear-shaped leaves, with a sharp pointed beard on each side. They are of a sea-green; and, when they first come out, are covered slightly with an ash-coloured pounce. From the joints of the stalk the flowers are produced, which are of the perfect bell-shape, and hang downward; they are of a flame-colour, marked with stripes of a brownish red: the flower is divided into five parts; at the bottom of each is seated a nectarium, covered with a white transparent skin, much resembling those of the crown imperial, but smaller. The flowers begin to open in the beginning of October, and there is often a succession of them till March. The stalks decay to the root in June, and new ones spring up in August.

Culture, &c. The first sort is cultivated to adorn halls, and to place before chimnies in the summer when it is in flower, for which purpose there is no plant more proper; for when the roots are strong, they will send out four or five stalks which will rise as many feet high, and are adorned with flowers a great part of their length. When the flowers begin to open, the pots are removed into the rooms, where, being shaded from the sun and rain, the flowers will continue long in beauty; and if the pots are every night removed into a more airy situation, but not exposed to heavy rains, the flowers will be fairer, and continue much longer in beauty. Those plants which are thus treated, are seldom fit for the purpose the following season; therefore a supply of young ones must be annually raised. The plant may be propagated either by dividing the roots or by seeds, but the latter produce the most vigorous and best flowering plants. The seeds must be sown in autumn in boxes or pots filled with light undunged earth, and placed in the open air till the frost or hard rains come on: then they must be placed under a hot-bed frame, where they may be sheltered from both; but in mild weather the glasses should be drawn off every day, that they may enjoy the free air: with this management the plants will come up early in the spring, and then they must be removed out of the frame, placing them first in a warm situation; but, when the season becomes warm, they should be so placed as to have the morning sun only. In September the leaves of the plants will begin to decay, at which time they should be transplanted; therefore there must be one or two beds prepared, in proportion to the number of plants. These beds must be in a warm situation, and the earth light, sandy, and without any mixture of dung. The plants must then be taken out of the pots or cases very carefully, so as not to bruise their roots; for they are very tender, and on being broken the milky juice will flow out plentifully, which will greatly weaken them. These should be planted at about six inches distance each way, with the head or crown of the root half an inch below the surface. If the season proves dry, they must be gently watered three or four days after they are planted; the beds should also be covered with mats in the day time, but

Campanula, which should be taken off at night to let the dew fall on the plants. Towards the end of November the beds should be covered over with some old tanners bark to keep out the frost; and where there is not conveniency for covering them with frames, they should be arched over with hoops, that in severe weather they may be covered with mats. In the spring the mats must be removed, and, the following summer, the plants kept free from weeds. In autumn the earth should be stirred between them, some fresh earth spread over the beds, and the plants covered in winter as before. In these beds the plants may remain two years, during which time they are to be treated in the manner before directed. The roots will now be strong enough to flower; so, in September they should be carefully taken up, and some of the most promising carefully planted in pots; the others may be planted in warm borders, or in a fresh bed, at a greater distance than before, to allow them room to grow. Those plants which are potted should be sheltered in winter from great rains and hard frosts, otherwise they will be in danger of rotting, or at least will be so weakened as not to flower with any strength the following summer; and those which are planted in the full ground, should have some old tanners bark laid round them to prevent the frost from getting at the roots. The second, third, fourth, and fifth sorts are so easily propagated by parting the roots, or by seeds, that no particular directions for their culture need be given. The sixth sort, which is cultivated for its esculent roots, may be propagated by seeds, which are to be sown in a shady border; and when the plants are about an inch high, the ground shall be hoed as is practised for onions, to cut up the weeds, and thin the plants, to the distance of three or four inches; and when the weeds come up again they must be hoed over to destroy them: this, if well performed in dry weather, will make the ground clean for a long time; so that, being three times repeated, it will keep the plants clean till winter, which is the season for eating the roots, when they may be taken up for use as wanted. They will continue good till April, at which time they send out their stalks, when the roots become hard and unfit for use.—The seventh and eighth sorts are easily propagated by seeds, which they produce in plenty. If these, and the Venus navelwort, dwarf lychnis, candy-tuft, and other low annual flowers, are properly mixed in the border of the flower-garden, and sown at two or three different seasons, so as to have a succession of them in flower, they will make an agreeable variety. If these seeds are sown in autumn, the plants will flower early in the spring; but if sown in the spring, they will not flower till the middle of June; and if a third sowing is performed about the middle of May, the plants will flower in August; but from these, good seeds must not be expected.—The ninth sort is propagated by parting the roots, which must be done with caution: for if they are broken or wounded, the milky juice will flow out plentifully; and if planted before the wounds are skinned over, it occasions their rotting: therefore when any of them are broken, they should be laid in the green-house a few days to heal. These roots must not be too often parted, if they are expected to flower well; for by this means they are weakened. The best time for transplanting and parting their roots is in July, soon after the stalks are de-

cayed. They must not be planted in rich earth, otherwise they will be very luxuriant in branches, and have but few flowers. They succeed best in a light sandy loam, mixed with a fourth part of screened lime-rubbish: when the roots are first planted the pots should be placed in the shade, and unless the season is very dry they should not be watered; for during the time they are inactive, wet is very injurious to them. About the middle of August, the roots will begin to put out fibres; at which time, if the pots are placed under a hot-bed frame, and, as the nights grow cool, covered with the glasses, but opened every day to enjoy the free air, it will greatly forward them for flowering, and increase their strength: when the stalks appear, they must be now and then refreshed with water; but it must not be given too often, nor in too great quantity. The plants thus managed, by the middle of September will have grown so tall as not to be kept any longer under the glass frame; they must, therefore, be removed into a dry airy glass-case, where they may enjoy the free air in mild weather, but screened from the cold. During the winter season they must be frequently refreshed with water, and guarded from frost; and, in the spring, when the stalks begin to decay, the pots should be set abroad in the shade, and not watered.

CAMPBELL (Archibald), earl and marquis of Argyle, was the son of Archibald earl of Argyle, by the lady Anne Douglass, daughter of William earl of Morton. He was born in the year 1598; and educated in the profession of the Protestant religion, according to the strictest rules of the church of Scotland, as it was established immediately after the reformation. During the commonwealth he was induced to submit to its authority. Upon the restoration, he was tried for his compliance; a crime common to him with the whole nation, and such a one as the most loyal and affectionate subject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court letters which he had wrote to Albemarle, while that general governed Scotland, and which contained expressions of the most cordial attachment to the established government. But, besides the general indignation excited by Albermarle's discovery of this private correspondence, men thought, that even the highest demonstrations of affection might, during jealous times, be exacted as a necessary mark of compliance from a person of such distinction as Argyle; and could not, by any equitable construction, imply the crime of treason. The parliament, however, scrupled not to pass sentence upon him, and he suffered with great constancy and courage.

CAMPBELL (Archibald), earl of Argyle, son to the former, had from his youth distinguished himself by his loyalty and his attachment to the royal family. Though his father was head of the covenanters, he himself refused to concur in any of their measures; and when a commission of colonel was given him by the convention of states, he forbore to act upon it till it should be ratified by the king. By his respectful behaviour, as well as by his service, he made himself acceptable to Charles when that prince was in Scotland and even after the battle of Worcester, all the misfortunes which attended the royal cause could not engage him to desert it. Under

Campbell. der Middleton he obstinately persevered to harass and infect the victorious English; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon after fallen upon to commit him to prison; and his confinement was rigorously continued till the restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had anew remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in summer 1681, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefeasible right of succession, this parliament enacted a test, which all persons possessed of offices, civil, military, or ecclesiastical, were bound to take. In this test the king's supremacy was asserted, the covenant renounced, passive obedience assented to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the state of the test as proposed by the courtiers; but the country party proposed also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of resistance was inculcated; so that the test being voted in a hurry, was found on examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was zealously opposed by Argyle; who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the duke of York, of which he soon felt the fatal consequences.

When Argyle took the test as a privy counsellor, he subjoined, in the duke's presence, an explanation which he had before hand communicated to that prince, and which he believed to have been approved by him. It was in these words. "I have considered the test, and am very desirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my station, and in a lawful way, from wishing and endeavouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty: and this I understand as a part of my oath." The duke, as was natural,

Campbell. heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that day in council: and it was impossible to imagine that a capital offence had been committed where occasion seemed not to have been given so much as for a frown or reprimand.

Argyle was much surprised a few days after, to find that a warrant was issued for committing him to prison; that he was indicted for high treason, leasing-making, and perjury; and that from the innocent words abovementioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on; and the forms of law were preserved to sanctify, or rather aggravate, the oppression. Of five judges, three did not scruple to find the guilt of treason and leasing-making to be incurred by the prisoner: a jury of 15 noblemen gave verdict against him; and the king being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies: He made his escape from prison, and till he could find a ship for Holland he concealed himself during some time in London. The king heard of his lurking place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert himself in order to recover the constitution by force of arms, he concerted measures with the duke of Monmouth, and went into Scotland, to assemble his friends: but not meeting with the success he expected, he was taken prisoner; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30, 1685. He showed great constancy and courage under his misfortunes: on the day of his death he ate his dinner very cheerfully: and, according to custom, slept after it a quarter of an hour or more, very soundly. At the place of execution, he made a short, grave, and religious speech; and, after solemnly declaring that he forgave all his enemies, submitted to death with great firmness.

CAMPBELL (Archibald), first duke of Argyle, son to the preceding, was an active promoter of the revolution. He came over with the Prince of Orange; was admitted into the convention as Earl of Argyle, tho' his father's attainder was not reversed; and in the claim of rights the sentence against him was declared to be, what most certainly it was, a reproach upon the nation. The establishment of the crown upon the Prince and Princess of Orange being carried by a great majority in the Scottish convention, the earl was sent from the nobility, with Sir James Montgomery and Sir John Dalrymple from the barons and boroughs, to offer the crown, in the name of the convention, to their Majesties, and tendered them the coronation oath; for which, and many other eminent services, he was admitted a member of the privy council, and, in 1690, made one of the Lords of the Treasury. He was afterwards

Campbell. afterwards made a colonel of the Scots horse guards; and, in 1694, one of the extraordinary Lords of Session. He was likewise created Duke of Argyle, Marquis of Kintyre and Lorn, Earl of Campbell and Cowell, Viscount of Lochow and Glengla, Lord Inverary, Mull, Morvern, and Terrey, by letters-patent, bearing date at Kensington the 23d of June 1701. He sent over a regiment to Flanders for king William's service, the officers of which were chiefly of his own name and family, who bravely distinguished themselves through the whole course of the war. He married Elizabeth, daughter of Sir Lionel Talmaish of Helmingham in the county of Suffolk, by Elizabeth duchess of Lauderdale his wife, daughter and heir of William Murray earl of Dysart, by whom he left issue two sons and a daughter; namely, John duke of Argyle, the subject of the next article; Archibald, who succeeded his brother as Duke of Argyle; and Lady Anne, married to James Stuart, second earl of Bute, by whom she had the present earl.

CAMPBELL (John), second duke of Argyle, and also duke of Greenwich and baron of Chatham, son to the subject of the preceding article, was born on the 10th of October 1680; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three pair of stairs high without receiving any hurt. At the age of 15, he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to king William, who in the year 1694 gave him the command of a regiment. In this situation he remained till the death of his father in 1703; when becoming duke of Argyle, he was soon after sworn of queen Anne's privy council, made captain of the Scotch horse guards, and appointed one of the extraordinary lords of session. In 1704, her Majesty reviving the Scottish order of the thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of *baron of Chatham* and *earl of Greenwich*, and in 1710 was made knight of the garter. His grace first distinguished himself in his military capacity at the battle of Oudenard; where he commanded as brigadier-general, with all the bravery of youth and the conduct of a veteran officer. He was present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory obtained over the French at the battle of Malplaquet, by dislodging them from the wood of Sart, and gaining a post of great consequence. In this sharp engagement, several musket-balls passed through the duke's clothes, hat, and peruke. Soon after this hot action, he was sent to take the command in Spain; and after the reduction of Port Mahon, he returned to England. His grace having now a seat in the house of lords, he censured the measures of the ministry with such freedom, that all his places were disposed of to other noblemen: but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander in chief of his majesty's forces in North Britain; and was the principal means and cause of the total extinction, at that time, of the rebellion in Scotland, without much

bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell earl of Braidalbin, of the same family and kindred, by some fatal error that ever misguided and misled that unhappy family of the Stuarts and all its adherents. The consequence was, that both sets of Campbells, from family affection, refused to strike a stroke, and retired out of the battle. He arrived at London March 6th 1716, and was in high favour: but, to the surprise of people of all ranks, he was in a few months divested of all his employments; and from this period to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719, he was again admitted into favour, appointed lord-steward of the household, and in April following was created duke of Greenwich. He continued in the administration during all the remaining part of that reign; and, after his late majesty's accession, till April 1740; when he delivered a speech with such warmth, that the ministry being highly offended, he was again dismissed from his employments. To these, however, on the change of the ministry, he was soon restored; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement; and died of a paralytic disorder on the 4th of October 1743. To the memory of his grace a very noble monument was erected in Westminster-Abbey, executed by the ingenious Roubilliac.

The duke of Argyle, though never first minister, was a very able statesman and politician, most steadily fixed in those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected; witness that application said to be made to him by one of the adherents of the Stuart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent the letter to the secretary of state; and it vexed him much even to have an application made him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witness his boldly attacking the great duke of Marlborough in the house of lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, though in all other respects he was the most able general of his time. The duke of Argyle, on all occasions, spoke well, with a firm, manly, and noble eloquence; and seems to deserve the character given of him by Pope:

Argyle the state's whole thunder born to wield,
And shake alike the senate and the field.

In private life, the duke's conduct was highly exemplary. He was an affectionate husband and an indulgent master. He seldom parted with his servants till age had rendered them incapable of their employments; and then he made provision for their subsistence. He was liberal to the poor, and particularly to persons of merit in distress: but though he was ready to patronize deserving persons, he was extremely cau-

tious

Campbell. tious not to deceive any by lavish promises, or leading them to form vain expectations. He was a strict economist, and paid his tradesmen punctually every month; and though he maintained the dignity of his rank, he took care that no part of his income should be wasted in empty pomp or unnecessary expences. He was twice married; and left five daughters, but no male issue. The titles of duke and earl of Greenwich and baron of Chatham became extinct at his death; but in his other titles he was succeeded by his brother Archibald earl of Ila, the subject of the next article.

CAMPBELL (Archibald), third Duke of Argyle, brother to the subject of the preceding article, was born at Hamhouse, in England, in June 1682, and was educated at the University of Glasgow. He afterwards applied himself to the study of the law at Utrecht; but, upon his father's being created a Duke, he betook himself to a military life, and served some time under the duke of Marlborough. Upon quitting the army, in which he did not long remain, he applied to the acquisition of that knowledge which would enable him to make a figure in the political world. In 1705, he was constituted treasurer of Scotland, and made a considerable figure in Parliament, though he was not more than twenty-three years of age. In 1706, he was appointed one of the commissioners for treating of the Union; and the same year was created Lord Ormsay, Dunoon, and Arrois, Viscount and Earl of Ilay. In 1708, he was made an extraordinary Lord of Session; and when the Union was effected, he was chosen one of the Sixteen Peers for Scotland, in the first Parliament of Great-Britain; and was constantly elected to every future Parliament till his death, except the fourth. In 1710, he was made Justice-General of Scotland. In 1711, he was called to the privy council; and upon the accession of George I. he was nominated lord register of Scotland. When the rebellion broke out in 1715, he again betook himself to arms, in defence of the house of Hanover, and by his prudent conduct in the West Highlands, he prevented General Gordon, at the head of three thousand men, from penetrating into the country, and raising levies. He afterwards joined his brother at Stirling, and was wounded at the battle of Dumblain. In 1725, he was appointed keeper of the privy seal; and, from this time, he was entrusted with the management of Scottish affairs. In 1734, upon his resigning the privy seal, he was made keeper of the great seal, which office he enjoyed till his death. Upon the decease of his brother, he became duke of Argyle, hereditary justice general, lieutenant, sheriff, and commissary of Argyleshire and the Western Isles, hereditary great master of the household, hereditary keeper of Dunstaffnage, Carrick, and several other castles. He was also chancellor of the University of Aberdeen; and laboured to promote the interest of that, as well as of the other universities of Scotland. He particularly encouraged the school of physic at Edinburgh, which has now acquired so high a reputation. Having the chief management of Scotch affairs, he was also extremely attentive to promote the trade, manufactures, and improvements of his country. It was by his advice that, after the rebellion in 1745, the Highlanders were employed in the royal army. He was a man of great endowments both natural and acquired, well versed in the laws of his country, and pos-

essed considerable parliamentary abilities. He was Campbell. likewise eminent for his skill in human nature, had great talents for conversation, and had collected one of the most valuable private libraries in Great Britain. He built himself a very magnificent seat at Inverary. The faculties of his mind continued sound and vigorous till his death, which happened suddenly on the 15th of April 1761, in the 79th year of his age. He was married, but had no issue; and was succeeded in his titles and the estates of the family by John Campbell, fourth duke of Argyle, son of the honourable John Campbell of Mammere, who was the second son of Archibald the ninth earl of Argyle.

The family of Argyle was heritable justice-general for Scotland till abolished by the jurisdiction act. They are still heritable masters of the king's household in Scotland, and keepers of Dunstaffnage and Carrick.

CAMPBELL (John), an eminent historical, biographical, and political writer, was born at Edinburgh, March 8, 1707-8. His father, Robert Campbell of Glenlyon, Esq; was captain of horse in a regiment commanded by the then earl of Hyndford; and his mother, Elizabeth, daughter of — Smith, Esq; of Windsor in Berkshire, had the honour of claiming a descent from the poet Waller. Our author, their fourth son, was at the age of five years brought from Scotland to Windsor, where he received the first principles of his education; and at a proper age, he was placed out as clerk to an attorney, being intended for the law. This profession, however, he never followed; but by a close application to the acquisition of knowledge of various kinds, became qualified to appear with great advantage in the literary world. In 1736, before he had completed his 30th year, he gave to the public, in two volumes folio, "The Military History of Prince Eugene and the Duke of Marlborough," enriched with maps, plans, and cuts. The reputation hence acquired, occasioned him soon after to be solicited to take a part in the "Ancient Universal History." Whilst employed in this capital work, Mr Campbell found leisure to entertain the world with other productions. In 1739, he published the "Travels and Adventures of Edward Brown, Esq;" 8vo. In the same year appeared his "Memoirs of the Bashaw Duke de Ripperda," 8vo, reprinted, with improvements, in 1740. These memoirs were followed, in 1741, by the "Concise History of Spanish America," 8vo. In 1742, he was the author of "A Letter to a Friend in the Country, on the Publication of Thurloe's State Papers;" giving an account of their discovery, importance, and utility. The same year was distinguished by the appearance of the 1st and 2d volumes of his "Lives of the English Admirals, and other eminent British Seamen." The two remaining volumes were completed in 1744; and the whole, not long after, was translated into German. This was the first of Mr Campbell's works to which he prefixed his name; and it is a performance of great and acknowledged merit. In 1743, he published "Hermippus revived;" a second edition of which, much improved and enlarged, came out in 1749, under the following title: "Hermippus Redivivus: or, the Sage's Triumph over old Age and the Grave. Wherein a method is laid down for prolonging the life and vigour of man. Including a Commentary upon an ancient Inscription, in which this great secret is revealed; supported

Campbell

ported by numerous authorities. The whole interspersed with a great variety of remarkable and well-attested relations." This extraordinary tract had its origin in a foreign publication; but it was wrought up to perfection by the additional ingenuity and learning of Mr Campbell. In 1744, he gave to the public in two volumes folio, his "Voyages and Travels," on Dr Harris's plan, being a very distinguished improvement of that collection which had appeared in 1705. The time and care employed by Mr Campbell in this important undertaking, did not prevent his engaging in another great work, the "Biographia Britannica," which began to be published in weekly numbers in 1745, and extended to seven volumes folio; but our author's articles were only in the first four volumes; of which, Dr Kippis observes, they constitute the prime merit.

When the late Mr Doddsley formed the design of "The Preceptor," which appeared in 1748, Mr Campbell was to assist in the undertaking; and the parts written by him were the Introduction to Chronology, and the Discourse on Trade and Commerce, both of which displayed an extensive fund of knowledge upon these subjects. In 1750, he published the first separate edition of his "Present State of Europe;" a work which had been originally begun in 1746, in the "Museum," a very valuable periodical performance, printed for Doddsley. There is no production of our author's that hath met with a better reception. It has gone through six editions, and fully deserved this encouragement. The next great undertaking which called for the exertion of our author's abilities and learning, was "The Modern Universal History." This extensive work was published, from time to time, in detached parts, till it amounted to 16 volumes folio; and a second edition of it, in 8vo, began to make its appearance in 1759. The parts of it written by Mr Campbell were, the histories of the Portuguese, Dutch, Spanish, French, Swedish, Danish, and Ostend Settlements in the East-Indies; and the Histories of the Kingdoms of Spain, Portugal, Algarve, Navarre, and that of France, from Clovis to 1656. As our author had thus distinguished himself in the literary world, the degree of LL.D. was very properly and honourably conferred upon him, June 18, 1754, by the university of Glasgow.

His principal and favourite work was, "A political survey of Great Britain," 2 vol. 4to, published a short time before his death; in which the extent of his knowledge, and his patriotic spirit, are equally conspicuous. Dr Campbell's reputation was not confined to his own country, but extended to the remotest parts of Europe. As a striking instance of this, it may be mentioned, that in the spring of 1774, the empress of Russia was pleased to honour him with the present of her picture, drawn in the robes worn in that country in the days of John Basiliowitz, grand duke of Muscovy, who was contemporary with queen Elizabeth. To manifest the doctor's sense of her imperial majesty's goodness, a sett of the "Political Survey of Britain," bound in Morocco, highly ornamented, and accompanied with a letter descriptive of the triumphs and felicities of her reign, was forwarded to St Petersburg, and conveyed into her hands by prince Orloff, who had resided some months in this kingdom.

Dr Campbell in 1736 married Elizabeth, daughter of Benjamine Vobe, of Leominster, in the county of Hereford, gentleman, with whom he lived nearly 40 years in the greatest conjugal harmony and happiness. So wholly did he dedicate his time to books, that he seldom went abroad: but to relieve himself as much as possible from the inconveniences incident to a sedentary life, it was his custom, when the weather would admit, to walk in his garden; or otherwise in some room of his house, by way of exercise. By this method, united with the strictest temperance in eating, and an equal abstemiousness in drinking, he enjoyed a good state of health, though his constitution was delicate. His domestic manner of living did not preclude him from a very extensive and honourable acquaintance. His house, especially on a Sunday evening, was the resort of the most distinguished persons of all ranks, and particularly of such as had rendered themselves eminent by their knowledge or love of literature. He received foreigners, who were fond of learning, with an affability and kindness which excited in them the highest respect and veneration; and his instructive and cheerful conversation made him the delight of his friends in general. He was, during the latter part of his life, agent for the province of Georgia in North America; and died at the close of the year 1775, in the 67th year of his age. The Doctor's literary knowledge was by no means confined to the subjects on which he more particularly treated as an author; he was well acquainted with the mathematics, and had read much in medicine. It hath been with great reason believed, that if he had dedicated his studies to the last science, he would have made a very conspicuous figure in the physical profession. He was eminently versed in the different parts of sacred literature; and his acquaintance with the languages extended not only to the Hebrew, Greek, and Latin among the ancient, and to the French, Italian, Spanish, Portuguese, and Dutch, among the modern; but likewise to the Oriental tongues. He was particularly fond of the Greek language. His attainment of such a variety of knowledge was exceedingly assisted by a memory surprisingly retentive, and which indeed astonished every person with whom he was conversant. In communicating his ideas, he had an uncommon readiness and facility; and the style of his works, which had been formed upon the model of that of the celebrated bishop Sprat, was perspicuous, easy, flowing, and harmonious. To all these accomplishments of the understanding, Dr Campbell joined the more important virtues of a moral and pious character. His disposition was gentle and humane, and his manners kind and obliging. He was the tenderest of husbands, a most indulgent parent, a kind master, a firm and sincere friend. To his great Creator he paid the constant and ardent tribute of devotion, duty, and reverence; and in his correspondences he showed that a sense of piety was always nearest his heart.

CAMPBELLTOWN, a parliament town of Argyllshire in Scotland, seated on the lough of Kilkerran, on the eastern shore of Kintyre or Cantyre, of which it is the capital. It hath a good harbour; and is now a very considerable place, though within these 50 years only a petty fishing town. It has in fact been created by the fishery: for it was appointed the

Campbell
||
Campbell-
town.

Campden place of rendezvous for the buffes; and above 260 have been seen in the harbour at once. The inhabitants are reckoned to be upwards of 8000 in number. W. Long. 5. 10. N. Lat. 54.

**Camp-huy-
fen.**

CAMPDEN, a small town of Gloucestershire in England, containing about 200 houses. It gives title of Viscount, by courtesy, to Earl of Gainsborough his son. W. Long. 1. 50. N. Lat. 52.

CAMPEACHY, a town of Mexico in South America, seated on the east coast of a bay of the same name, on the west of the province of Yucataro. It is defended by a good wall and strong forts; but is neither so rich, nor carries on such a trade, as formerly; it having been the port for the sale of logwood, the place where it is cut being about 30 miles distant. It was taken by the English in 1596; by the buccaners in 1678; and by the Flibusters of St Domingo in 1685, who set it on fire and blew up the citadel. W. Long. 93. 7. N. Lat. 19. 20.

CAMPEACHY-Wood, in botany. See *HÆMATOXYLUM*.

CAMPEN, a strong town of Overijssel in the United Provinces. It hath a citadel and a harbour; but the latter is almost choked up with sand. It was taken by the Dutch in 1578, and by the French in 1672; but they abandoned it the following year. It is seated near the mouth of the river Yssel and Zuider See. E. Long. 5. 35. N. Lat. 52. 38.

CAMPESTRE, in antiquity, a sort of cover for the privities, worn by the Roman soldiers in their field exercises; being girt under the navel, and hanging down to the knees. The name is supposed to be formed from *campus*, the field or place where the Roman soldiers performed their exercises.

CAMPHORA, or **CAMPHIRE**, a solid concrete juice extracted from the wood of the *laurus camphora*. See *LAURUS*, *CHEMISTRY*, and *MATERIA MEDICA*.

Pure camphire is very white, pellucid, somewhat unctuous to the touch; of a bitterish aromatic taste, yet accompanied with a sense of coolness; of a very fragrant smell, somewhat like that of rosemary, but much stronger. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, malignant and epidemical distempers. In deliria, also, where opiates could not procure sleep, but rather aggravated the symptoms, this medicine has often been observed to procure it. All these effects, however, Dr Cullen attributes to its sedative property, and denies that camphire has any other medicinal virtues than those of an antispasmodic and sedative. He allows it to be very powerful, and capable of doing much good or much harm. From experiments made on different brute creatures, camphire appears to be poisonous to every one of them. In some it produced sleep followed by death, without any other symptom. In others, before death, they were awakened into convulsions and rage. It seems, too, to act chiefly on the stomach; for an entire piece swallowed, produced the abovementioned effects with very little diminution of weight.

CAMPHUYSEN, (Dirk Theodore Raphael), an eminent painter, was born at Gorcum in 1586. He learned the art of painting from Diederick Govertze; and by a studious application to it, he very soon not only equalled, but far surpassed his master. He had an uncommon genius, and studied nature with care,

VOL. IV. Part I.

judgement, and assiduity. His subjects were landscapes, mostly small, with ruinous buildings, huts of peasants, or views of villages on the banks of rivers, with boats and hoys, and generally he represented them by moonlight. His pencil is remarkably tender and soft, his colouring true nature and very transparent, and his expertness in perspective is seen in the proportional distances of his objects, which are excellently contrived, and have a surprising degree of nature and truth. As he left off painting at an age when others are scarcely qualified to commence artists, few of his work are to be met with, and they bring considerable prices; as they cannot but give pleasure to the eye of every observer. He painted his pictures with a thin body of colour, but they are handled with singular neatness and spirit. He practised in his profession only till he was 18 years of age, and being then recommended as a tutor to the sons of the lord of Nieupoort, he undertook the employment, and discharged it with so much credit, that he was appointed secretary to that nobleman. He excelled in drawing with a pen; and the designs which he finished in that manner are exceedingly valued.

CAMPIAN (Edmund), an English Jesuit, was born at London, of indigent parents, in the year 1540; and educated at Christ's hospital, where he had the honour to speak an oration before queen Mary on her accession to the throne. He was admitted a scholar of St John's college in Oxford at its foundation, and took the degree of master of arts in 1564. About the same time he was ordained by a bishop of the church of England, and became an eloquent Protestant preacher. In 1566, when queen Elizabeth was entertained by the university of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy act in St Mary's church. In 1568, he was junior proctor of the university. In the following year, he went over to Ireland, where he wrote a history of that kingdom, and turned papist; but being found rather too assiduous in persuading others to follow his example, he was committed to prison. He soon, however, found means to make his escape. He landed in England in 1571; and thence proceeded to Doway in Flanders, where he publicly recanted his former heresy, and was created bachelor of divinity. He went soon after to Rome, where, in 1573, he was admitted of the society of Jesus, and was sent by the general of that order to Vienna, where he wrote his tragedy called *Nectar et ambrosia*, which was acted before the emperor with great applause.

From Vienna he went to Prague in Bohemia, where he resided in the Jesuits college about six years, and then returned to Rome. From thence, in 1580, he was sent by Pope Gregory XIII. with the celebrated Father Parsons, to convert the people of England. From Pitts we learn, that, some time before, several English priests, inspired by the Holy Ghost, had undertaken to convert their countrymen; that 80 of these foreign seminaries, besides several others who by God's grace had been converted in England, were actually engaged in the pious work with great success; that some of them had suffered imprisonment, chains, tortures, and ignominious death, with becoming constancy and resolution: but seeing at last that the labour was abundant and the labourers few, they solicited the assistance of the

Campian.

Campion
Campistron

Jesuits; requesting, that though not early in the morning, they would at least in the third, sixth, or ninth hour, send labourers into the Lord's vineyard. In consequence of this solicitation, the above two were sent to England. They arrived in an evil hour for Campian, at Dover; and were next day joyfully received by their friends at London. He had not been long in England, before Walsingham the secretary of state, being informed of his uncommon assiduity in the cause of the church of Rome, used every means in his power to have him apprehended, but for a long time without success. However, he was at last taken by one Elliot, a noted priest-taker, who found him in the house of Edward Yates, Esq; at Lyford in Berkshire, and conducted him in triumph to London, with a paper on his hat, on which was written *Campion the Jesuit*. He was imprisoned in the Tower; where, Wood says, "he did undergo many examinations, abuses, wrackings, tortures;" *exquisitissimis cruciatibus tortus*, says Pitts. It is hoped, for the credit of our reformers, this torturing part of the story is not true. The poor wretch, however, was condemned, on the statute 25 Ed. III. for high treason; and butchered at Tyburn, with two or three of his fraternity. Howsoever criminal in the eye of the law, or of the English gospel, might be the zeal of this Jesuit for the salvation of the poor heretics of this kingdom, biographers of each persuasion unite in giving him a great and amiable character. "All writers (says the Oxford antiquary), whether Protestants or Popish, say, that he was a man of admirable parts; an elegant orator, a subtle philosopher and disputant, and an exact preacher whether in English or the Latin tongue, of a sweet disposition, and a well-polished man." Fuller, in his church-history, says, "he was of a sweet nature, constantly carrying about him the charms of a plausible behaviour, of a fluent tongue, and good parts." His History of Ireland, in two books, was written in 1570; and published, by Sir James Ware, from a manuscript in the Cotton library, Dublin, 1633, folio. He wrote also *Chronologia universalis*, a very learned work; and various other tracts.

CAMPICURSIO, in the ancient military art, a march of armed men for several miles, from and back again to the camp, to instruct them in the military pace. This exercise was nearly akin to the *decurfio*, from which it only differed, in that the latter was performed by horsemen, the former also by foot.

CAMPIDUCTORES, or CAMPIDUCTORES, in the Roman army, were officers who instructed the soldiery in the discipline and exercises of war, and the art of handling their weapons to advantage. These are also sometimes called *campigeni*, and *armidoctores*.

CAMPIDUCTOR, in middle-age writers, signifies the leader or commander of an army, or party.

CAMPION, in botany, the English name of the *LYCHNIS*.

CAMPION a town of the kingdom of Tanguth in Tartary. It was formerly remarkable for being a place through which the caravans passed in the road from Bukharia to China. E. Long. 104. 53. N. Lat. 40. 25.

CAMPISTRON, a celebrated French dramatic author, was born in 1656. Racine directed his poetical talents to the theatre, and assisted him in his first pieces. He died in 1723.

CAMPITÆ, in church history, an appellation given to the donatists, on account of their assembling in the fields for want of churches. For a similar reason, they were also denominated *Montenses* and *Rupitani*.

CAMPLI, or CAMPOLI, a town of Italy, in the kingdom of Naples, and in the farther Abruzzo, situated in E. Long. 13. 55. N. Lat. 42. 38.

CAMPO MAJOR, a town of the province of Alentejo in Portugal. W. Long. 7. 24. N. Lat. 38. 50.

CAMPREDON, a town of Catalonia in Spain, seated at the foot of the Pyrenean mountains. The fortifications were demolished by the French in 1691. W. Long. 1. 56. N. Lat. 42. 20.

CAMPS (Francis de), abbot of Notre Dame at Sigi, was born at Amiens in 1643; and distinguished himself by his knowledge of medals, by writing an history of France, and several other works. He died at Paris in 1723.

CAMPVERE, See VEER.

CAMPUS, in antiquity, a field or vacant plain in a city, not built upon, left vacant on account of shows, combats, exercises, or other uses of the citizens.

CAMPUS Maii, in ancient customs, an anniversary assembly of our ancestors held on May-day, when they confederated together for the defence of the kingdom against all its enemies.

CAMPUS Martius, a large plain in the suburbs of ancient Rome, lying between the Quirinal and Capitoline mounts and the Tiber, thus called because consecrated to the god Mars, and set apart for military sports and exercises to which the Roman youth were trained, as the use and handling of arms, and all manner of feats of activity. Here were the races run, either with chariots or single horses; here also stood the villa publica, or palace for the reception of ambassadors, who were not permitted to enter the city. Many of the public comitia were held in the same field, part of which was for that purpose cantoned out. The place was also nobly decorated with statues, arches, columns, porticoes, and the like structures.

CAMPUS Sceleratus, a place without the walls of ancient Rome, where the Vestals who had violated their vows of virginity were buried alive.

CAMUL, a town of Asia, on the eastern extremity of the kingdom of Cialus, on the frontiers of Tangut. E. Long. 98. 5. N. Lat. 37. 15.

CAMUS, a person with a low flat nose, hollowed in the middle.

The Tartars are great admirers of camus beauties. Rubruquis observes, that the wife of the great Jenghiz Khan, a celebrated beauty, had only two holes for a nose.

CAMUS (John Peter), a French prelate born in 1582. He was author of a number of pious romances (the taste of his time), and other theological works, to the amount of 200 vols. His definition of politics is remarkable: *Ars non tam regendi, quam fallendi, homines*; "the art not so much of governing, as of deceiving mankind." He died in 1652.

CAN, in the sea-language, as can-pump, a vessel wherewith seamen pour water into the pump to make it go.

CAN-Buoy. See BOUY.

CAN-Hook, an instrument used to sling a cask by the ends of the staves: it is formed by fixing a broad and flat

Campita
Can.

Cana,
Canaan.

flat hook at each end of a short rope; and the tackle by which the cask so slung may be hoisted or lowered, is hooked to the middle of the rope.

CANA (anc. geog.), a town on the confines of the Upper and Lower Galilee: memorable for the turning water into wine (John). The birth place of Simeon, called *Canaanite* from this place, and of Nathaniel.

CANAAN, the fourth son of Ham. The irreverence of Ham towards his father Noah is recorded in Gen. ix. Upon that occasion the patriarch cursed him in a branch of his posterity: "Curfed," says he, "be Canaan; a servant of servants shall he be unto his brethren." This curse being pronounced, not against Ham the immediate transgressor, but against his son, who does not appear, from the words of Moses, to have been any ways concerned in the crime, hath occasioned several conjectures. Some have believed that Noah cursed Canaan, because he could not well have cursed Ham himself, whom God had not long before blessed. Others think Moses's chief intent in recording this prediction was to raise the spirits of the Israelites, then entering on a terrible war with the children of Canaan, by the assurance, that, in consequence of the curse, that people were destined by God to be subdued by them. For the opinion of those who imagine all Ham's race were here accursed, seems repugnant to the plain words of Scripture, which confines the malediction to Canaan and his posterity; and is also contrary to fact. Indeed, the prophecy of Noah, that Canaan "should be a servant of servants to his brethren," seems to have been wholly completed in him. It was completed with regard to Shem, not only in that a considerable part of the seven nations of the Canaanites were made slaves to the Israelites, when they took possession of their land, as part of the remainder of them were afterwards enslaved by Solomon; but also by the subsequent expeditions of the Assyrians and Persians, who were both descended from Shem; and under whom the Canaanites suffered subjection, as well as the Israelites; not to mention the conquest of part of Canaan by the Elamites, or Persians, under Chedorlaomer, prior to them all. With regard to Japhet, we find a completion of the prophecy, in the successive conquests of the Greeks and Romans in Palestine and Phœnicia, where the Canaanites were settled; but especially in the total subversion of the Carthaginian power by the Romans; besides some invasions of the northern nations, as the posterity of Thorgarma and Magog; wherein many of them, probably, were carried away captive.

The posterity of Canaan were very numerous. His eldest son was Sidon, who at least founded and peopled the city of Sidon, and was the father of the Sidonians and Phœnicians. Canaan had besides ten sons, who were the fathers of so many people, dwelling in Palestine, and in part of Syria; namely, the Hittites, the Jebusites, the Amorites, the Girgasites, the Hivites, the Arkites, the Sinites, the Arvadites, the Zemarites, and Hamathites.

Land of CANAAN, the country so named from Canaan the son of Ham. It lies between the Mediterranean sea and the mountains of Arabia, and extends from Egypt to Phœnicia. It is bounded to the east by the mountains of Arabia; to the south by the wil-

derness of Paran, Idumæa, and Egypt; to the west by the Mediterranean, called in Hebrew the Great Sea; to the north by the mountains of Libanus. Its length from the city of Dan (since called Cæsarea Philippi, or Paneadis, which stands at the foot of these mountains) to Beersheba, is about 70 leagues; and its breadth from the Mediterranean sea to the eastern borders, is in some places 30. This country, which was first called Canaan, from Canaan the son of Ham, whose posterity possessed it, was afterwards called Palestine, from the people which the Hebrews call Philistines, and the Greeks and Romans corruptly Palestinians, who inhabited the sea coasts, and were first known to them. It likewise had the name of the *Land of Promise*, from the promise God made Abraham of giving it to him; that of the *Land of Israel*, from the Israelites having made themselves masters of it; that of *Judah*, from the tribe of Judah, which was the most considerable of the twelve; and lastly, the happiness it had of being sanctified by the presence, actions, miracles, and death of Jesus Christ, has given it the name of the *Holy Land*, which it retains to this day.

The first inhabitants of this land therefore were the Canaanites, who were descended from Canaan, and the eleven sons of that patriarch. Here they multiplied extremely; trade and war were their first occupations; these gave rise to their riches, and the several colonies scattered by them over almost all the islands and maritime provinces of the Mediterranean. The measure of their idolatry and abominations was completed, when God delivered their country into the hands of the Israelites. In St Athanasius's time, the Africans still said they were descended from the Canaanites; and it is said, that the Punic tongue was almost entirely the same with the Canaanitish and Hebrew language. The colonies which Cadmus carried into Thebes in Bœotia, and his brother Cilix into Cilicia, came from the stock of Canaan. The isles of Sicily, Sardinia, Malta, Cyprus, Corfu, Majorca and Minorca, Gades and Ebusus, are thought to have been peopled by the Canaanites. Bochart, in his large work entitled *Canaan*, has set all this matter in a good light.

Many of the old inhabitants of the north-west of the land of Canaan, however, particularly on the coast or territories of Tyre and Sidon, were not driven out by the children of Israel, whence this tract seems to have retained the name of Canaan a great while after those other parts of the country, which were better inhabited by the Israelites, had lost the said name. The Greeks called this tract inhabited by the old Canaanites along the Mediterranean sea, Phœnicia; the more inland parts, as being inhabited partly by Canaanites, and partly by Syrians, Syrophœnicia: and hence the woman said by St Matthew (xv. 22.) to be a woman of Canaan, whose daughter Jesus cured, is said by St Mark (vii. 26.) to be a Syrophœnician by nation, as she was a Greek by religion and language.

CANADA, or the province of Quebec, an extensive country of North America, bounded on the north-east by the gulph of St Lawrence, and St John's river; on the south-west, by lands inhabited by the savage Indians, which are frequently included in this province; on the south, by the provinces of Nova Scotia, New England, and New York; and on the

Canaan,
Canada.

Canada.

north-west, by other Indian nations. Under the name of *Canada*, the French comprehended a very large territory; taking into their claim part of New Scotland, New England, and New York on the east; and extending it on the west as far as the Pacific Ocean. That part, however, which was reduced by the British arms in the last war, lies between 61 and 81 degrees of west longitude, and between 45 and 52 of north latitude. The climate is not very different from that of the northern British colonies; but as it is much further from the sea, and more to the northward, than most of those provinces, it has a much severer winter, though the air is generally clear; and, like most of those American tracts that do not lie too far to the northward, the summers are very hot, and exceeding pleasant. The soil in general is very good, and in many parts extremely fertile; producing many different sorts of grains, fruits, and vegetables. The meadow grounds, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. The uncultivated parts are a continued wood, composed of prodigiously large and lofty trees, of which there is such a variety of species, that even of those who have taken most pains to know them, there is not perhaps one that can tell half the number. Canada produces, among others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and female maple; three sorts of ash-trees, the free, the mungrel, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech-trees and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which made out of one piece will contain 20 persons; others are made of the bark; the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; the ribs of these canoes are made of boughs of trees. In the hollow elms, the bears and wild cats take up their lodging from November to April. The country produces also a vast variety of other vegetables, particularly tobacco, which thrives well. Near Quebec is a fine lead mine, and many excellent ones of iron have been discovered. It hath also been reported that silver is found in some of the mountains. The rivers are extremely numerous, and many of them very large and deep. The principal are, the Ouattauais, St John's, Seguinay, Despaires, and Trois Rivières; but all these are swallowed up by the great river St Lawrence. This river issues from the lake Ontario; and, taking its course north-east, washes Montreal, where it receives the Ouattauais, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes so broad and so deep, that ships of the line contributed in the last war to reduce that city. After receiving in its progress innumerable streams, it at last falls into the ocean at cape Rosiers, where it is 90 miles broad, and where the cold is intense and the sea boisterous. This river is the only one upon which any settlements of note are as yet formed; but it is very probable, that, in time to come, Canada, and those vast regions to the west, may be enabled of them-

selfes to carry on a considerable trade upon the great lakes of fresh water which these countries environ. Here are five lakes, the least of which is of greater extent than the fresh-water lakes to be found in any other part of the world: these are the lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is about 300 leagues in circuit; as also is that of Michigan, though like lake Erie it is rather long, and comparatively narrow. But the lake Superior is larger than any of these, being not less than 500 leagues in circumference. All these are navigable by any vessels, and they all communicate with each other; but the passage between Erie and Ontario is interrupted by a most stupendous fall or cataract, called the *falls of Niagara**. The river St Lawrence, as already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French built forts at these several straits, by which the lakes communicate with one another, and on that where the last of them communicates with the river. By these, while the country was in their possession, they effectually secured to themselves the trade of the lakes, and preserved an influence over all the Indian nations that lie near them.

The most curious and interesting part of the natural history of Canada is the animals there produced. These are stags, elks, deer, bears, foxes, martins, wild cats, ferrets, weasels, large squirrels of a greyish hue, hares and rabbits. The southern parts, in particular, breed great numbers of wild bulls, divers sorts of roe bucks, goats, wolves, &c. The marshes, lakes, and pools, with which this country abounds, swarm with otters and beavers, of which the white are highly valued, as well as the right black kind. A vast variety of birds are also to be found in the woods; and the river St Lawrence abounds with such quantities of fish, that it is affirmed by some writers, this would be a more profitable article than even the fur-trade.—There are in Canada a multitude of different Indian tribes: but these are observed to decrease in number where the Europeans are most numerous; owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. Their manners and way of living we have already particularly described†. The principal towns are Quebec, Trois Rivières, and Montreal. The commodities required by the Canadians from Europe are, wine, or rather rum; cloths, chiefly coarse; linen; and wrought iron. The Indian trade requires rum, tobacco, a sort of duffil blankets, gums, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds. While the country was in possession of the French, the Indians supplied them with poultry; and the French had traders, who, like the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the furs, &c. home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. On this occasion many solemnities were observed, guards were

— 80.

Canada. were placed, and the governor assisted to preserve order in so great and various a concourse of savage nations. But sometimes great disorders and tumults happened; and the Indians frequently gave for a dram all that they were possessed of. It is remarkable, that many of these nations actually passed by the English settlement of Albany in New York, and travelled 200 miles further to Montreal, though they could have purchased the goods they wanted cheaper at the former.

Since Britain became possessed of Canada, our trade with that country has generally employed 34 ships and 400 seamen; their exports, at an average of three years, in skins, furs, ginseng, snake-root, capillaire, and wheat, amount to 150,000*l*. Their imports from Great Britain are computed at nearly the same sum. It will, however, be always impossible to overcome certain inconveniences arising from the violence of the winter. This is so excessive from December to April, that the broadest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St Lawrence below Montreal, which prevent ships from penetrating to that emporium of inland commerce. Our communication therefore with Canada, and the immense regions beyond it, will always be interrupted during the winter-season, until roads are formed that can be travelled without danger from the Indians. For these savage people often commit hostilities against us, without any previous notice; and frequently, without any provocation, they commit the most horrid ravages for a long time with impunity.

Canada was undoubtedly discovered by Sebastian CABOT, the famous Italian adventurer, who sailed under a commission from Henry VII. But though the English monarch did not think proper to make any use of this discovery, the French quickly attempted it; we have an account of their fishing for cod on the banks of Newfoundland, and along the sea-coast of Canada, in the beginning of the 16th century. About the year 1506, one Denys, a Frenchman, drew a map of the gulph of St Lawrence; and two years after, one Aubert, a ship-master of Dieppe, carried over to France some of the natives of Canada. As the new country, however, did not promise the same amazing quantities of gold and silver produced by Mexico and Peru, the French for some years neglected the discovery. At last, in the year 1523, Francis I. a sensible and enterprising prince, sent four ships, under the command of Verazani, a Florentine, to prosecute discoveries in that country. The particulars of this man's first expedition are not known. All we can learn is, that he returned to France, and next year he undertook a second. As he approached the coast, he met with a violent storm; however, he came so near as to perceive the natives on the shore, making friendly signs to him to land. This being found impracticable by reason of the surf upon the coast, one of the sailors threw himself into the sea; but, endeavouring to swim back to the ship, a surge threw him on shore without signs of life. He was, however, treated by the natives with such care and humanity, that he recovered his strength, and was allowed to swim back to the ship, which immediately returned to France. This is all we know of Vera-

zani's second expedition. He undertook a third, but Canada. was no more heard of, and it is thought that he and all his company perished before he could form any colony. In 1534, one Jaques Cartier of St Maloes set sail under a commission from the French king, and on the 10th of May arrived at Cape Bonavista in Newfoundland. He had with him two small ships besides the one in which he sailed. He cruised along the coasts of that island, on which he discovered inhabitants, probably the Eskimaux. He landed in several places along the coast of the Gulf, and took possession of the country in the king's name. On his return, he was again sent out with a commission, and a pretty large force: he returned in 1535, and passed the winter at St Croix; but the season proved so severe, that he and his companions must have died of the scurvy, had they not, by the advice of the natives, made use of the decoction of the tops and bark of the white pines. As Cartier, however, could produce neither gold nor silver, all that he could say about the utility of the settlement was disregarded; and in 1540, he was obliged to become pilot to one M. Roberval, who was by the French king appointed viceroy of Canada, and who sailed from France with five vessels. Arriving at the gulph of St Lawrence, they built a fort; and Cartier was left to command the garrison in it, while Roberval returned to France for additional recruits to his new settlement. At last, having embarked in 1549, with a great number of adventurers, neither he nor any of his followers were heard of more.

This fatal accident so greatly discouraged the court of France, that, for 50 years, no measure were taken for supplying with necessaries the settlers that were left. At last, Henry IV. appointed the Marquis de la Roche lieutenant-general of Canada and the neighbouring countries. In 1598 he landed on the isle of Sable, which he absurdly thought to be a proper place for a settlement, though it was without any port, and without product except briars. Here he left about 40 malefactors, the refuse of the French jails. After cruising for some time on the coast of Nova Scotia, without being able to relieve these poor wretches, he returned to France, where he died of a broken heart. His colony must have perished, had not a French ship been wrecked on the island, and a few sheep driven upon it at the same time. With the boards of the ship they erected huts; and while the sheep lasted they lived on them, feeding afterwards on fish. Their clothes wearing out, they made coats of seal-skins; and in this miserable condition they spent seven years, when Henry ordered them to be brought to France. The king had the curiosity to see them in their seal-skin dresses, and was so moved with their appearance, that he forgave them all their offences, and gave each of them 50 crowns to begin the world anew.

In 1600, one Chauvin, a commander in the French navy, attended by a merchant of St Malo, called *Pontgrave*, made a voyage to Canada, from whence he returned with a very profitable quantity of furs. Next year he repeated the voyage with the same good fortune, but died while he was preparing for a third. The many specimens of profit to be made by the Canadian trade, at last induced the public to think favourably of it. An armament was equipped, and the command of it given to Pontgrave, with powers to extend his discoveries.

Caminha
||
Camoens.

where it signified minister, and was changed from *cas-*
millus. The Tuscans also gave the appellation *Camil-*
lus to Mercury, in quality of minister of the gods.

CAMINHA, a maritime town of Portugal, in the
province of Entre-Douro e-Minho, with the title of a
duchy. It is situated at the mouth of the river Min-
ho, in W. Long. 9. 15. N. Lat. 41. 44.

CAMIS, or KAMIS, in the *Japanese Theology*, de-
note deified souls of ancient heroes, who are supposed
still to interest themselves in the welfare of the people
over whom they anciently commanded.

The camis answer to the heroes in the ancient Greek
and Roman theology, and are venerated like the saints
in the modern Romish church.

Besides the heroes or camis beatified by the consent
of antiquity, the *mikaddos*, or pontiffs, have deified
many others, and continue still to grant the apotheosis
to new worthies; so that they swarm with *camis*: the
principal one is *Tensio Dai Sin*, the common father of
Japan, to whom are paid devotions and pilgrimages
extraordinary.

CAMISADE, in the art of war, an attack by sur-
prise in the night, or at the break of day, when the
enemy is supposed to be a-bed. The word is said to
have taken its rise from an attack of this kind; where-
in, as a badge or signal to know one another by, they
bore a shift, in French called *chemise*, or *camise*, over
their arms.

CAMISARDS, a name given by the French to
the Calvinists of the Cevennes, who formed a league,
and took up arms in their own defence, in 1688.

CAMLETINE, a slight stuff, made of hair and
coarse silk, in the manner of camblet. It is now out
of fashion.

CAMMA, and GOBBI, two provinces of the king-
dom of Loango in Africa. The inhabitants are con-
tinually at war with each other. The weapons they
formerly used in their wars were the short pike, bows
and arrows, sword and dagger; but since the Euro-
peans have become acquainted with that coast, they
have supplied them with fire-arms. The chief town
of Gobbi lies about a day's journey from the sea. Their
rivers abound with a variety of fish; but are infested
with sea-horses, which do great mischief both by land
and water. The principal commerce with the natives
is in logwood, elephants teeth, and tails, the hair of
which is highly valued, and used for several curious
purposes.

CAMMIN, a maritime town of Germany, in Bran-
denburg Pomerania, situated in E. Long. 15°. N. Lat.
54°.

CAMOENS (Louis de), a famous Portuguese poet,
the honour of whose birth is claimed by different cities.
But according to N. Antonio, and Manuel Correa, his
intimate friend, this event happened at Lisbon in 1517.
His family was of considerable note, and originally
Spanish. In 1370, Vasco Perez de Caamans, disgust-
ed at the court of Castile, fled to that of Lisbon, where
king Ferdinand immediately admitted him into his
council, and gave him the lordships of Sardoal, Pun-
nete, Marano, Amendo, and other considerable lands;
a certain proof of the eminence of his rank and abili-
ties. In the war for the succession, which broke out
on the death of Ferdinand, Camoens sided with the

king of Castile, and was killed in the battle of Alja-
barota. But though John I. the victor, seized a great
part of his estate, his widow, the daughter of Gonfalo
Tereyro, grand master of the order of Christ, and ge-
neral of the Portuguese army, was not reduced beneath
her rank. She had three sons who took the name of
Camoens. The family of the eldest intermarried with
the first nobility of Portugal; and even, according to
Castera, with the blood royal. But the family of the
second brother, whose fortune was slender, had the su-
perior honour to produce the author of the *Lusiad*.

Early in his life the misfortunes of the poet began.
In his infancy, Simon Vaz de Camoens, his father,
commander of a vessel, was shipwrecked at Goa, where,
with his life, the greatest part of his fortune was lost.
His mother, however, Anne de Macedo of Santarene,
provided for the education of her son Louis at the uni-
versity of Coimbra. What he acquired there, his
works discover; an intimacy with the classics, equal to
that of a Scaliger, but directed by the taste of a Mil-
ton or a Pope.

When he left the university, he appeared at court.
He was handsome; had speaking eyes, it is said; and
the finest complexion. Certain it is, however, he was
a polished scholar, which, added to the natural ardour
and gay vivacity of his disposition, rendered him an
accomplished gentleman. Courts are the scenes of in-
trigue; and intrigue was fashionable at Lisbon. But
the particulars of the amours of Camoens rest unknown.
This only appears: he had aspired above his rank, for
he was banished from the court; and in several of his
sonnets he ascribes this misfortune to love.

He now retired to his mother's friends at Santarene.
Here he renewed his studies, and began his poem on
the discovery of India. John III. at this time prepared
an armament against Africa. Camoens, tired of his in-
active obscure life, went to Ceuta in this expedition,
and greatly distinguished his valour in several rencoun-
ters. In a naval engagement with the Moors in the
straits of Gibraltar, in the conflict of boarding, he was
among the foremost, and lost his right eye. Yet nei-
ther hurry of actual service nor the dissipation of the
camp could stifle his genius. He continued his *Lusi-*
adas, and several of his most beautiful sonnets were
written in Africa, while, as he expressed it,

One hand the pen, and one the sword, employ'd.

The fame of his valour had now reached the court,
and he obtained permission to return to Lisbon. But,
while he solicited an establishment which he had merit-
ed in the ranks of battle, the malignity of evil tongues,
as he calls it in one of his letters, was injuriously pour-
ed upon him. Though the bloom of his early youth
was effaced by several years residence under the scor-
ching heavens of Africa, and though altered by the loss
of an eye, his presence gave uneasiness to the gentle-
men of some families of the first rank where he had
formerly visited. Jealousy is the characteristic of the
Spanish and Portuguese; its resentment knows no
bounds, and Camoens now found it prudent to banish
himself from his native country. Accordingly, in
1553, he sailed for India, with a resolution never to
return. As the ship left the Tagus, he exclaimed, in
the words of the sepulchral monument of Scipio Afri-
canus, *Ingrata patria, non possidebis ossa mea!* "Ungrate-
ful

Camoens

Camoens. ful country, thou shalt not possess my bones!" But he knew not what evils in the East would awake the remembrance of his native fields.

When Camoens arrived in India, an expedition was ready to sail to revenge the king of Cochin on the king of Pimenta. Without any rest on shore after his long voyage, he joined this armament, and in the conquest of the Alagada islands displayed his usual bravery.

In the year following, he attended Manuel de Vafconcello in an expedition to the Red Sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined in the fleet or camp. He visited Mount Felex and the adjacent inhospitable regions of Africa, which he so strongly pictures in the *Lusiad*, and in one of his little pieces where he laments the absence of his mistress.

When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his Epic Poem. But this serenity was interrupted, perhaps by his own imprudence. He wrote some satires which gave offence; and, by order of the viceroy Francisco Barreto, he was banished to China.

The accomplishments and manners of Camoens soon found him friends, though under the disgrace of banishment. He was appointed commissary of the defunct in the island of Macao, a Portuguese settlement in the bay of Canton. Here he continued his *Lusiad*; and here also, after five years residence, he acquired a fortune, though small, yet equal to his wishes. Don Constantine de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulph near the mouth of the river Mehon on the coast of China. All he had acquired was lost in the waves: his poems, which he held in one hand, while he swam with the other, were all he found himself possessed of when he stood friendless on the unknown shore. But the natives gave him a most humane reception: this he has immortalised in the prophetic song in the tenth *Lusiad*; and in the seventh, he tells us, that here he lost the wealth which satisfied his wishes.

Agora da esperança já adquirida, &c.

Now blest with all the wealth fond hope could crave,
Soon I beheld that wealth beneath the wave
For ever lost;—

My life, like Judah's heaven-doom'd king of yore,
By miracle prolong'd—

On the banks of the Mehon, he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time, till an opportunity offered to carry him to Goa. When he arrived at that city, Don Constantine de Braganza, the viceroy, whose characteristic was politeness, admitted him into intimate friendship, and Camoens was happy till count Redondo assumed the government. Those who had formerly procured the banishment of the satirist, were silent while Constantine was in power; but now they exerted all their arts against him. Redondo, when he entered on office, pretended to be the friend of Camoens; yet, with all that unfeeling indifference with which he made his most

horrible witticism on the Zamorim, he suffered the innocent man to be thrown into the common prison. After all the delay of bringing witnesses, Camoens, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy and reproach. But Camoens had some creditors; and these detained him in prison a considerable time, till the gentlemen of Goa began to be ashamed that a man of his singular merit should experience such treatment among them. He was set at liberty; and again he assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, appointed governor of the fort at Sofala, by high promises, allured the poet to attend him thither. The governor of a distant fort, in a barbarous country, shares in some measure the fate of an exile. Yet, though the only motive of Barreto was, in this unpleasant situation, to retain the conversation of Camoens at his table, it was his least care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But this the governor ungenerously endeavoured to prevent, and charged him with a debt for board. Anthony de Cabra, however, and Hector de Sylveyra, paid the demand; and Camoens, says Faria, and the honour of Barreto, were sold together.

After an absence of 16 years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the pestilence then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his *Lusiad*, which, in the opening of the first book, in a most elegant turn of compliment, he addressed to his prince, king Sebastian, then in his 18th year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar.

Though the great patron of one species of literature, a species the reverse of that of Camoens, certain it is, that the author of the *Lusiad* was utterly neglected by Henry, under whose inglorious reign he died in all the misery of poverty. By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which these houses provide. He had a black servant, who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, saved his master's life in the unhappy shipwreck where he lost his effects, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to erect the spirit of a downward age. To the eye of a careful observer, the fate of Camoens throws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same degenerated spirit, which suffered Camoens to depend on his share of the alms begged in the streets by his old hoary servant,

Camomile,
Camp.

vant, the same spirit which caused this, sunk the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portugal were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which hastened his exit. In one of his letters he has these remarkable words: *Em fim accaberey a vida, e verram todos que fuy efeicoada a minha patria, &c.* "I am ending the course of my life, the world will witness how I have loved my country. I have returned, not only to die in her bosom, but to die with her."

In this unhappy situation, in 1579, in his 62d year, the year after the fatal defeat of Don Sebastian, died Louis de Camoens, the greatest literary genius ever produced by Portugal; in martial courage and spirit of honour, nothing inferior to her greatest heroes. And in a manner suitable to the poverty in which he died, was he buried.

CAMOMILE, in botany. See ANTHEMIS.

CAMP, the ground on which an army pitch their tents. It is marked out by the quarter-master general, who appoints every regiment their ground.

The chief advantages to be minded in chusing a camp for an army, are, to have it near the water, in a country of forage, where the soldiers may find wood for dressing their victuals; that it have a free communication with garrisons, and with a country from whence it may be supplied with provisions; and, if possible, that it be situated on a rising ground, in a dry gravelly soil. Besides, the advantages of the ground ought to be considered, as marshes, woods, rivers, and inclosures; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel about 500 yards distance; the horse and dragoons, on the wings, and the foot, in the centre: sometimes a body of two, three, or four brigades is encamped behind the two lines, and is called the *body of reserve*. The artillery and bread-waggons are generally encamped in the rear of the two lines. A battalion of foot is allowed 80 or 100 paces for its camp; and 30 or 40 for an interval betwixt one battalion and another. A squadron of horse is allowed 30 for its camp, and 30 for an interval, and more if the ground will allow it.

Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers; because, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off the moist and putrid exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close beset with trees; for then the air is not only moist and hurtful in itself, but by stagnating becomes more susceptible of corruption. However, let the situation of camps be ever so good, they are frequently rendered infectious by the putrid effluvia of rotten straw, and the privies of the army; more especially if the bloody flux prevails, in which case the best method of preventing a general infection, is to leave the ground with the privies, foul straw, and other filth of the camp, behind. This must be frequently done, if consistent with the military operations: but when these render it improper to change the ground often, the privies should be made deeper than usual, and once a-day

Nº 62.

a thick layer of earth thrown into them till the pits are near full; and then they are to be well covered, and supplied by others. It may also be a proper caution to order the pits to be made either in the front or the rear, as the then stationary winds may best carry off their effluvia from the camp. Moreover, it will be necessary to change the straw frequently, as being not only apt to rot, but to retain the infectious steams of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an inclosure of the height of 10 hands-breadth. It made a square of 12 miles in compass about the tabernacle; and within this was another, called the *Levites camp*.

The Greeks had also their camps, fortified with gates and ditches. The Lacedæmonians made their camp of a round figure, looking upon that as the most perfect and defensible of any form: we are not, however, to imagine, that they thought this form so essential to a camp, as never to be dispensed with when the circumstances of the place require it. Of the rest of the Grecian camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The figure of the Roman camp was a square divided into two principal parts: in the upper parts were the general's pavilion, or prætorium, and the tent of the chief officers; in the lower, those of inferior degree were placed. On one side of the prætorium stood the quæstorium, or apartment of the treasurer of the army; and near this the forum, both for a market-place and the assembling of councils. On the other side of the prætorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside of the tribunes were the præfecti of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati, then those of the extraordinarii and ablecti equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called *principia*, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse; next to them were quartered the triarii; then the principes, and close by them the hastati; afterwards the foreign horse, and lastly the foreign foot. They fortified their camp with a ditch and parapet, which they termed *fossa* and *vallum*; in the latter some distinguish two parts, viz. the *agger* or earth, and the *fudes* or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the tents themselves formed of the same matter.

In the front of the Turkish camp are quartered the janizaries and other foot, whose tents encompass their aga: in the rear are the quarters of the spahis and other horsemen. The body of the camp is possessed by the stately tents or pavilions of the vizer or general, rais effendi or chancellor, kahija or steward, the tester-dar bashaw or lord treasurer, and kapislar kahiafee or master

Camp.

Camp
||
Campaign.

master of the ceremonies. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafna or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent *lailac*, the place where the courts of justice are held; it being the disposition of this that is to regulate all the rest.

The Arabs still live in camps, as the ancient Scenites did. The camp of the Assyne Emir, or king of the country about Tadmor, is described by a traveller who viewed it, as spread over a very large plain, and possessing so vast a space, that though he had the advantage of a rising ground, he could not see the utmost extent of it. His own tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of hair-cloth.

CAMP, is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade with them. In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their warehouses and shops there, but also live in these camps with their whole families. The Europeans, however, are so far indulged, that at Siam, and almost every where else, they may live either in the cities or suburbs, as they shall judge most convenient.

CAMP fight, or KAMP fight, in law writers, denotes the trial of a cause by duel, or a legal combat of two champions in the field, for decision of some controversy.

In the trial by camp fight, the accuser was, with the peril of his own body, to prove the accused guilty; and by offering him his glove, to challenge him to this trial, which the other must either accept of, or acknowledge himself guilty of the crime whereof he was accused.

If it were a crime deserving death, the camp fight was for life and death: if the offence deserved only imprisonment, the camp fight was accomplished when one combatant had subdued the other, so as either to make him yield or take him prisoner. The accused had liberty to choose another to fight in his stead, but the accuser was obliged to perform it in his own person, and with equality of weapons. No women were permitted to be spectators, nor men under the age of thirteen. The priest and the people who looked on, were engaged silently in prayer, that the victory might fall to him who had right. None might cry, shriek, or give the least sign; which in some places was executed with so much strictness, that the executioner stood ready with an axe to cut off the right hand or foot of the party that should offend herein.

He that, being wounded, yielded himself, was at the other's mercy either to be killed or suffered to live. But if life were granted him, he was declared infamous by the judge, and disabled from ever bearing arms, or riding on horseback.

CAMPAGNA. See CAMPANIA.

CAMPAIGN, in the art of war, denotes the space of time that an army keeps the field, or is encamped.—The beginning of every campaign is considerably more unhealthy than if the men were to remain in quarters. After the first fortnight or three weeks encampment,

VOL. IV. Part. I.

the sickness decreases daily; the most infirm being by that time in the hospitals, and the weather daily growing warmer. This healthy state continues throughout the summer, unless the men get wet clothes or wet beds; in which case, a greater or less degree of the dysentery will appear in proportion to the preceding heats. But the most sickly part of the campaign begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dews: then, and not sooner, the dysentery prevails; and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the rest of the campaign, and never entirely ceases, even in winter-quarters, till the frosts begin. At the beginning of a campaign the sickness is so uniform, that the number may be nearly predicted; but for the rest of the season, as the diseases are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a campaign, if protracted till the beginning of a campaign, is attended with more sickness than the first two months encampment: so that it is better to take the field a fortnight sooner, in order to return into winter-quarters so much the earlier. As to winter expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions. Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

CAMPANACEÆ, in botany, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are the following genera, viz. convolvulus, ipomæa, polemonium, campanula, roella, viola, &c. * See Botany, p. 462.

CAMPANELLA (Thomas,) a famous Italian philosopher, born at Stilo in Calabria, in 1568. He distinguished himself by his early proficiency in learning; for at the age of 13 he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. In order to arrive at truth, he shook off the yoke of authority: by which means the novelty of some of his opinions exposed him to many inconveniences; for at Naples he was thrown into prison, in which he remained 27 years, and during this confinement wrote his famous work entitled *Atheismus triumphatus*. Being at length set at liberty, he went to Paris, where he was graciously received by Louis XIII. and cardinal Richelieu; the latter procured him a pension of 2000 livres, and often consulted him on the affairs of Italy. Campanella passed the remainder of his days in a monastery of Dominicans at Paris, and died in 1639.

CAMPANI (Matthew) of Spoleto, curate at Rome, wrote a curious treatise on the art of cutting glasses for spectacles, and made several improvements in optics, assisted by his brother and pupil Joseph. He died after 1678.

CAMPANIA, a town of Italy, in the kingdom of Naples, and in the farther principato, with a bishop's see. E. Long. 15. 30. N. Lat. 40. 40.

CAMPANIA or *Campagna di Roma*, anciently Latium, a province of Italy, bounded on the west by the Tiber

Campania. Tiber and the sea, on the south-west by the sea, on the south by Terra di Lavoro, on the east by Abruzzo, and on the north by Sabina. Though the soil is good, it produces little or nothing, on account of the heavy duties on corn; and though the waters are good, the air is unwholesome. It is subject to the Pope, and is about 60 miles in length on the Mediterranean sea.

It hath been generally thought that the air of this country hath something in it peculiarly noxious during the summer-time; but Mr Condamine is of opinion that it is not more unhealthy than any other marshy country. His account follows. "It was after the invasion of the Goths in the fifth and sixth centuries that this corruption of the air began to manifest itself. The bed of the Tiber being covered by the accumulated ruins of the edifices of ancient Rome, could not but raise itself considerably. But what permits us not to doubt of this fact is, that the ancient and well-preserved pavement of the Pantheon and its portico is overflowed every winter; that the water even rises there sometimes to the height of eight or ten feet; and that it is not possible to suppose that the ancient Romans should have built a temple in a place so low as to be covered with the waters of the Tiber on the least inundation. It is evident, then, that the level of the bed of this river is raised several feet; which could not have happened without forming there a kind of dikes or bars. The choking up of its canal necessarily occasioned the overflow and reflux of its waters in such places as till then had not been subject to inundations: to these overflowings of the Tiber were added all the waters that escaped out of the ancient aqueducts, the ruins of which are still to be seen, and which were entirely broken and destroyed by Totila. What need, therefore, of any thing more to infect the air, in a hot climate, than the exhalations of such a mass of stagnating waters, deprived of any discharge, and become the receptacle of a thousand impurities, as well as the grave of several millions both of men and animals? The evil could not but increase from the same causes while Rome was exposed to the incursions and devastations of the Lombards, the Normans, and the Saracens, which lasted for several centuries. The air was become so infectious there at the beginning of the 13th century, that Pope Innocent III. wrote, that few people at Rome arrived to the age of forty years, and that nothing was more uncommon there than to see a person of sixty. A very short time after, the popes transferred the seat of their residence to Avignon: during the seventy-two years they remained there, Rome became a desert; the monasteries in it were converted into stables; and Gregory XI. on his return to Rome, in 1376, hardly counted there 30,000 inhabitants. At his death began the troubles of the great schism in the west, which continued for upwards of 50 years. Martin V. in whom this schism ended in the year 1429, and his first successors, were able to make but feeble efforts against so inveterate an evil. It was not till the beginning of the 16th century that Leo X. under whom Rome began to resume her wonted splendor, gave himself some trouble about re-establishing the salubrity of the air: but the city, being shortly after besieged twice successively by the emperor Charles V. saw itself plunged again into all its old calamities; and from 85,000 inhabitants, which it contained under Leo X. it was reduced under

Clement VIII. to 32,000. In short, it is only since the time of Pius V. and Sextus V. at the end of the 16th century, that the popes have constantly employed the necessary methods for purifying the air of Rome and its environs, by procuring proper discharges for the waters, drying up the humid and marshy grounds, and covering the banks of the Tiber and other places reputed uninhabitable with superb edifices. Since that time a person may dwell at Rome, and go in or out of it at all seasons of the year. At the beginning, however, of the present century, they were still afraid to lie out of the city in summer, when they had resided there; as they were also to return to it, when once they had quitted it. They never ventured to sleep at Rome, even in broad day, in any other house than their own. They are greatly relaxed at present from these ancient scruples: I have seen cardinals, in the months of July and August, go from Rome to lie at Frascati, Tivoli, Albano, &c. and return the next or the following days to the city, without any detriment to their health: I have myself tried all these experiments, without suffering the least inconvenience from them: we have even seen, in the last war in Italy, two armies encamped under the walls of Rome at the time when the heats were most violent. Yet, notwithstanding all this, the greater part of the country people dare not still venture to lie during that season of the year, nor even as much as sleep in a carriage, in any part of the territory comprehended under the name of the *Campagna of Rome*."

CAMPANIFORM, or CAMPANULATED, an appellation given to flowers resembling a bell.

CAMPANINI, a name given to an Italian marble dug out of the mountains of Carrara, because, when it is worked, it sounds like a bell.

CAMPANULA, or BELL-FLOWER; A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 29th order, *Campanaceae*. The corolla is campanulated, with its fundus closed up by the valves that support the stamina; the stigma is trifid; the capsule inferior, or below the receptacle of the flower, opening and emitting the seeds by lateral pores.

Species. Of this genus there are no fewer than 41 species enumerated by botanical writers; but the following are the most worthy of attention. 1. The pyramidalis hath thick tuberous roots filled with a milky juice; it sends out strong, smooth, upright stalks, which rise to the height of four feet, garnished with smooth oblong leaves a little indented at the edges. The flowers are produced from the side of the stalks, and are regularly set on for more than half their length, forming a sort of pyramid; these are large, open, and shaped like a bell. The most common colour of the flowers is blue, though some are white, but the former are most esteemed. 2. The decurrens, or peach-leaved bell-flower, is a native of the northern parts of Europe: of this there are some with white, and some with blue flowers, and some with double flowers of both colours. These last have of late been propagated in such abundance as to have almost banished from the gardens those with single flowers. 3. The medium, commonly called *Canterbury bell-flower*, is a biennial plant, which perishes soon after it has ripened its seeds. It grows naturally in the woods of Italy and Austria; but is cul-

Campani-
form
||
Campanula.

Campanula, cultivated in the British gardens for the beauty of its flowers, which are blue, purple, white, and striped, with double flowers of all the colours. This species hath oblong, rough, hairy, leaves, serrated on their edges: from the centre of these rises a stiff, hairy, furrowed stalk, about two feet high, sending out several lateral branches, garnished with long, narrow, hairy leaves sawed on their edges. From the setting on of these leaves proceed the footstalks of the flower; those which are on the lower part of the stalk and branches diminishing gradually in their length upward, and thereby forming a sort of pyramid. The flowers of this kind are very large, so make a fine appearance. The seeds ripen in September, and the plants decay soon after.

4. The trachelium, with nettle leaves, hath a perennial root, which sends up several stiff hairy stalks having two ribs or angles. These put out a few short side-branches, garnished with oblong hairy leaves deeply sawed on their edges. Toward the upper part of the stalks, the flowers come out alternately upon short trifid foot-stalks having hairy empalements. The colours of the flowers are a deep and a pale blue and white, with double flowers of the same; the double-flowered kind only merit a place in gardens.

5. The latifolia, or greatest bell-flower, hath a perennial root, composed of many fleshy fibres that abound with a milky juice. From these arise several strong, round single stalks, which never put out branches, but are garnished with oval spear-shaped leaves slightly indented on their edges. Towards the upper part of the stalk the flowers come out singly upon short foot-stalks; their colours are blue, purple, and white.

6. The rapunculus, or rampion, hath roundish fleshy roots, which are eatable, and much cultivated in France for sallads; some years past it was cultivated in the English gardens for the same purpose, but is now generally neglected. It is a native of Britain; but the roots of the wild sort never grow to half the size of those which are cultivated.

7. The speculum, with yellow eye-bright leaves, is an annual plant with slender stalks rising a foot high, branching out on every side, and garnished with oblong leaves a little curled on their edges; from the wings of the leaves come out the flowers sitting close to the stalks, which are of a beautiful purple inclining to a violet colour. In the evening, they contract and fold into a pentagonal figure; from whence it is by some called *viola pentagonia*, or *five-cornered violet*.

8. The hybrida, or common Venus looking-glass. This seldom rises more than six inches high, with a stalk branching from the bottom upward, and garnished with oval leaves sitting close to the stalks, from the base of which the branches are produced, which are terminated by flowers very like the former sort. This was formerly cultivated in the gardens: but since the former kind hath been introduced, it hath almost supplanted this; for the other is a much taller plant, and the flowers larger, though of a less beautiful colour.

9. The canariensis, with an orach leaf and tuberous root, is a native of the Canary islands. It hath a thick fleshy root of an irregular form; sometimes running downward like a parsnip, at other times dividing into several knobs near the top; and when any part of the root is broken, there issues out a milky juice at the wound. From the head or crown of the root arise one, two, three, or more stalks, in propor-

tion to the size of the root; but that in the centre is generally larger, and rises higher, than the others. These stalks are very tender, round, and of a pale green; their joints are far distant from each other; and when the roots are strong, the stalks will rise to ten feet high, sending out several lateral branches. At each joint they are garnished with two, three, or four spear-shaped leaves, with a sharp pointed beard on each side. They are of a sea-green; and, when they first come out, are covered slightly with an ash-coloured pounce. From the joints of the stalk the flowers are produced, which are of the perfect bell-shape, and hang downward; they are of a flame-colour, marked with stripes of a brownish red: the flower is divided into five parts; at the bottom of each is seated a nectarium, covered with a white transparent skin, much resembling those of the crown imperial, but smaller. The flowers begin to open in the beginning of October, and there is often a succession of them till March. The stalks decay to the root in June, and new ones spring up in August.

Culture, &c. The first sort is cultivated to adorn halls, and to place before chimnies in the summer when it is in flower, for which purpose there is no plant more proper; for when the roots are strong, they will send out four or five stalks which will rise as many feet high, and are adorned with flowers a great part of their length. When the flowers begin to open, the pots are removed into the rooms, where, being shaded from the sun and rain, the flowers will continue long in beauty; and if the pots are every night removed into a more airy situation, but not exposed to heavy rains, the flowers will be fairer, and continue much longer in beauty. Those plants which are thus treated, are seldom fit for the purpose the following season; therefore a supply of young ones must be annually raised. The plant may be propagated either by dividing the roots or by seeds, but the latter produce the most vigorous and best flowering plants. The seeds must be sown in autumn in boxes or pots filled with light undunged earth, and placed in the open air till the frost or hard rains come on: then they must be placed under a hot-bed frame, where they may be sheltered from both; but in mild weather the glasses should be drawn off every day, that they may enjoy the free air: with this management the plants will come up early in the spring, and then they must be removed out of the frame, placing them first in a warm situation; but, when the season becomes warm, they should be so placed as to have the morning sun only. In September the leaves of the plants will begin to decay, at which time they should be transplanted; therefore there must be one or two beds prepared, in proportion to the number of plants. These beds must be in a warm situation, and the earth light, sandy, and without any mixture of dung. The plants must then be taken out of the pots or cases very carefully, so as not to bruise their roots; for they are very tender, and on being broken the milky juice will flow out plentifully, which will greatly weaken them. These should be planted at about six inches distance each way, with the head or crown of the root half an inch below the surface. If the season proves dry, they must be gently watered three or four days after they are planted; the beds should also be covered with mats in the day time, but

Campanula, which should be taken off at night to let the dew fall on the plants. Towards the end of November the beds should be covered over with some old tanners bark to keep out the frost; and where there is not conveniency for covering them with frames, they should be arched over with hoops, that in severe weather they may be covered with mats. In the spring the mats must be removed, and, the following summer, the plants kept free from weeds. In autumn the earth should be stirred between them, some fresh earth spread over the beds, and the plants covered in winter as before. In these beds the plants may remain two years, during which time they are to be treated in the manner before directed. The roots will now be strong enough to flower; so, in September they should be carefully taken up, and some of the most promising carefully planted in pots; the others may be planted in warm borders, or in a fresh bed, at a greater distance than before, to allow them room to grow. Those plants which are potted should be sheltered in winter from great rains and hard frosts, otherwise they will be in danger of rotting, or at least will be so weakened as not to flower with any strength the following summer; and those which are planted in the full ground, should have some old tanners bark laid round them to prevent the frost from getting at the roots. The second, third, fourth, and fifth sorts are so easily propagated by parting the roots, or by seeds, that no particular directions for their culture need be given. The sixth sort, which is cultivated for its esculent roots, may be propagated by seeds, which are to be sown in a shady border; and when the plants are about an inch high, the ground shall be hoed as is practised for onions, to cut up the weeds, and thin the plants, to the distance of three or four inches; and when the weeds come up again they must be hoed over to destroy them: this, if well performed in dry weather, will make the ground clean for a long time; so that, being three times repeated, it will keep the plants clean till winter, which is the season for eating the roots, when they may be taken up for use as wanted. They will continue good till April, at which time they send out their stalks, when the roots become hard and unfit for use.—The seventh and eighth sorts are easily propagated by seeds, which they produce in plenty. If these, and the Venus navelwort, dwarf lychnis, candy-tuft, and other low annual flowers, are properly mixed in the border of the flower-garden, and sown at two or three different seasons, so as to have a succession of them in flower, they will make an agreeable variety. If these seeds are sown in autumn, the plants will flower early in the spring; but if sown in the spring, they will not flower till the middle of June; and if a third sowing is performed about the middle of May, the plants will flower in August; but from these, good seeds must not be expected.—The ninth sort is propagated by parting the roots, which must be done with caution: for if they are broken or wounded, the milky juice will flow out plentifully; and if planted before the wounds are skinned over, it occasions their rotting: therefore when any of them are broken, they should be laid in the green-house a few days to heal. These roots must not be too often parted, if they are expected to flower well; for by this means they are weakened. The best time for transplanting and parting their roots is in July, soon after the stalks are de-

cayed. They must not be planted in rich earth, otherwise they will be very luxuriant in branches, and have but few flowers. They succeed best in a light sandy loam, mixed with a fourth part of screened lime-rubbish: when the roots are first planted the pots should be placed in the shade, and unless the season is very dry they should not be watered; for during the time they are inactive, wet is very injurious to them. About the middle of August, the roots will begin to put out fibres; at which time, if the pots are placed under a hot-bed frame, and, as the nights grow cool, covered with the glasses, but opened every day to enjoy the free air, it will greatly forward them for flowering, and increase their strength: when the stalks appear, they must be now and then refreshed with water; but it must not be given too often, nor in too great quantity. The plants thus managed, by the middle of September will have grown so tall as not to be kept any longer under the glass frame; they must, therefore, be removed into a dry airy glass-case, where they may enjoy the free air in mild weather, but screened from the cold. During the winter season they must be frequently refreshed with water, and guarded from frost; and, in the spring, when the stalks begin to decay, the pots should be set abroad in the shade, and not watered.

CAMPBELL (Archibald), earl and marquis of Argyle, was the son of Archibald earl of Argyle, by the lady Anne Douglass, daughter of William earl of Morton. He was born in the year 1598; and educated in the profession of the Protestant religion, according to the strictest rules of the church of Scotland, as it was established immediately after the reformation. During the commonwealth he was induced to submit to its authority. Upon the restoration, he was tried for his compliance; a crime common to him with the whole nation, and such a one as the most loyal and affectionate subject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court letters which he had wrote to Albemarle, while that general governed Scotland, and which contained expressions of the most cordial attachment to the established government. But, besides the general indignation excited by Albermarle's discovery of this private correspondence, men thought, that even the highest demonstrations of affection might, during jealous times, be exacted as a necessary mark of compliance from a person of such distinction as Argyle; and could not, by any equitable construction, imply the crime of treason. The parliament, however, scrupled not to pass sentence upon him, and he suffered with great constancy and courage.

CAMPBELL (Archibald), earl of Argyle, son to the former, had from his youth distinguished himself by his loyalty and his attachment to the royal family. Tho' his father was head of the covenanters, he himself refused to concur in any of their measures; and when a commission of colonel was given him by the convention of states, he forbore to act upon it till it should be ratified by the king. By his respectful behaviour, as well as by his service, he made himself acceptable to Charles when that prince was in Scotland and even after the battle of Worcester, all the misfortunes which attended the royal cause could not engage him to desert it. Under

Campbell. der Middleton he obstinately persevered to harass and infect the victorious English; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon after fallen upon to commit him to prison; and his confinement was rigorously continued till the restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had anew remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in summer 1681, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefeasible right of succession, this parliament enacted a test, which all persons possessed of offices, civil, military, or ecclesiastical, were bound to take. In this test the king's supremacy was asserted, the covenant renounced, passive obedience assented to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the state of the test as proposed by the courtiers; but the country party proposed also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of resistance was inculcated; so that the test being voted in a hurry, was found on examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was zealously opposed by Argyle; who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the duke of York, of which he soon felt the fatal consequences.

When Argyle took the test as a privy counsellor, he subjoined, in the duke's presence, an explanation which he had before hand communicated to that prince, and which he believed to have been approved by him. It was in these words. "I have considered the test, and am very desirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my station, and in a lawful way, from wishing and endeavouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty: and this I understand as a part of my oath." The duke, as was natural,

heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that day in council: and it was impossible to imagine that a capital offence had been committed where occasion seemed not to have been given so much as for a frown or reprimand.

Argyle was much surprised a few days after, to find that a warrant was issued for committing him to prison; that he was indicted for high treason, leasing-making, and perjury; and that from the innocent words abovementioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on; and the forms of law were preserved to sanctify, or rather aggravate, the oppression. Of five judges, three did not scruple to find the guilt of treason and leasing-making to be incurred by the prisoner: a jury of 15 noblemen gave verdict against him; and the king being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies: He made his escape from prison, and till he could find a ship for Holland he concealed himself during some time in London. The king heard of his lurking place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert himself in order to recover the constitution by force of arms, he concerted measures with the duke of Monmouth, and went into Scotland, to assemble his friends: but not meeting with the success he expected, he was taken prisoner; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30, 1685. He showed great constancy and courage under his misfortunes: on the day of his death he ate his dinner very cheerfully: and, according to custom, slept after it a quarter of an hour or more, very soundly. At the place of execution, he made a short, grave, and religious speech; and, after solemnly declaring that he forgave all his enemies, submitted to death with great firmness.

CAMPBELL (Archibald), first duke of Argyle, son to the preceding, was an active promoter of the revolution. He came over with the Prince of Orange; was admitted into the convention as Earl of Argyle, though his father's attainder was not reversed; and in the claim of rights the sentence against him was declared to be, what most certainly it was, a reproach upon the nation. The establishment of the crown upon the Prince and Princess of Orange being carried by a great majority in the Scottish convention, the earl was sent from the nobility, with Sir James Montgomery and Sir John Dalrymple from the barons and boroughs, to offer the crown, in the name of the convention, to their Majesties, and tendered them the coronation oath; for which, and many other eminent services, he was admitted a member of the privy council, and, in 1690, made one of the Lords of the Treasury. He was afterwards

Campbell.

terwards

Campbell. terwards made a colonel of the Scots horse guards; and, in 1694, one of the extraordinary Lords of Session. He was likewise created Duke of Argyle, Marquis of Kintyre and Lorn, Earl of Campbell and Cowell, Viscount of Lochow and Glengla, Lord Iverary, Mull, Morvern, and Terrey, by letters-patent, bearing date at Kensington the 23d of June 1701. He sent over a regiment to Flanders for king William's service, the officers of which were chiefly of his own name and family, who bravely distinguished themselves through the whole course of the war. He married Elizabeth, daughter of Sir Lionel Talmaſh of Helmingham in the county of Suffolk, by Elizabeth duchess of Lauderdale his wife, daughter and heir of William Murray earl of Dysart, by whom he left issue two sons and a daughter; namely, John duke of Argyle, the subject of the next article; Archibald, who succeeded his brother as Duke of Argyle; and Lady Anne, married to James Stuart, second earl of Bute, by whom she had the present earl.

CAMPBELL (John), second duke of Argyle, and also duke of Greenwich and baron of Chatham, son to the subject of the preceding article, was born on the 10th of October 1680; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three pair of stairs high without receiving any hurt. At the age of 15, he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to king William, who in the year 1694 gave him the command of a regiment. In this situation he remained till the death of his father in 1703; when becoming duke of Argyle, he was soon after sworn of queen Anne's privy council, made captain of the Scotch horse guards, and appointed one of the extraordinary lords of session. In 1704, her Majesty reviving the Scottish order of the thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of *baron of Chatham* and *earl of Greenwich*, and in 1710 was made knight of the garter. His grace first distinguished himself in his military capacity at the battle of Oudenard; where he commanded as brigadier-general, with all the bravery of youth and the conduct of a veteran officer. He was present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory obtained over the French at the battle of Malplaquet, by dislodging them from the wood of Sart, and gaining a post of great consequence. In this sharp engagement, several musket-balls passed through the duke's clothes, hat, and peruke. Soon after this hot action, he was sent to take the command in Spain; and after the reduction of Port Mahon, he returned to England. His grace having now a seat in the house of lords, he censured the measures of the ministry with such freedom, that all his places were disposed of to other noblemen: but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander in chief of his majesty's forces in North Britain; and was the principal means and cause of the total extinction, at that time, of the rebellion in Scotland, without much

bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell earl of Braidalbin, of the same family and kindred, by some fatal error that ever misguided and misled that unhappy family of the Stuarts and all its adherents. The consequence was, that both sets of Campbells, from family affection, refused to strike a stroke, and retired out of the battle. He arrived at London March 6th 1716, and was in high favour: but, to the surprise of people of all ranks, he was in a few months divested of all his employments; and from this period to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719, he was again admitted into favour, appointed lord-steward of the household, and in April following was created duke of Greenwich. He continued in the administration during all the remaining part of that reign; and, after his late majesty's accession, till April 1740; when he delivered a speech with such warmth, that the ministry being highly offended, he was again dismissed from his employments. To these, however, on the change of the ministry, he was soon restored; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement; and died of a paralytic disorder on the 4th of October 1743. To the memory of his grace a very noble monument was erected in Westminster-Abbey, executed by the ingenious Roubilliac.

The duke of Argyle, though never first minister, was a very able statesman and politician, most steadily fixed in those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected; witness that application said to be made to him by one of the adherents of the Stuart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent the letter to the secretary of state; and it vexed him much even to have an application made him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witness his boldly attacking the great duke of Marlborough in the house of lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, though in all other respects he was the most able general of his time. The duke of Argyle, on all occasions, spoke well, with a firm, manly, and noble eloquence; and seems to deserve the character given of him by Pope:

Argyle the state's whole thunder born to wield,
And shake alike the senate and the field.

In private life, the duke's conduct was highly exemplary. He was an affectionate husband and an indulgent master. He seldom parted with his servants till age had rendered them incapable of their employments; and then he made provision for their subsistence. He was liberal to the poor, and particularly to persons of merit in distress: but though he was ready to patronize deserving persons, he was extremely cau-

tious

Campbell. tious not to deceive any by lavish promises, or leading them to form vain expectations. He was a strict economist, and paid his tradesmen punctually every month; and though he maintained the dignity of his rank, he took care that no part of his income should be wasted in empty pomp or unnecessary expences. He was twice married; and left five daughters, but no male issue. The titles of duke and earl of Greenwich and baron of Chatham became extinct at his death; but in his other titles he was succeeded by his brother Archibald earl of Ila, the subject of the next article.

CAMPBELL (Archibald), third Duke of Argyle, brother to the subject of the preceding article, was born at Hamhouse, in England, in June 1682, and was educated at the University of Glasgow. He afterwards applied himself to the study of the law at Utrecht; but, upon his father's being created a Duke, he betook himself to a military life, and served some time under the duke of Marlborough. Upon quitting the army, in which he did not long remain, he applied to the acquisition of that knowledge which would enable him to make a figure in the political world. In 1705, he was constituted treasurer of Scotland, and made a considerable figure in Parliament, though he was not more than twenty-three years of age. In 1706, he was appointed one of the commissioners for treating of the Union; and the same year was created Lord Ormsay, Dunoon, and Arrois, Viscount and Earl of Ilay. In 1708, he was made an extraordinary Lord of Session; and when the Union was effected, he was chosen one of the Sixteen Peers for Scotland, in the first Parliament of Great-Britain; and was constantly elected to every future Parliament till his death, except the fourth. In 1710, he was made Justice-General of Scotland. In 1711, he was called to the privy council; and upon the accession of George I. he was nominated lord register of Scotland. When the rebellion broke out in 1715, he again betook himself to arms, in defence of the house of Hanover, and by his prudent conduct in the West Highlands, he prevented General Gordon, at the head of three thousand men, from penetrating into the country, and raising levies. He afterwards joined his brother at Stirling, and was wounded at the battle of Dunblain. In 1725, he was appointed keeper of the privy seal; and, from this time, he was entrusted with the management of Scottish affairs. In 1734, upon his resigning the privy seal, he was made keeper of the great seal, which office he enjoyed till his death. Upon the decease of his brother, he became duke of Argyle, hereditary justice general, lieutenant, sheriff, and commissary of Argyleshire and the Western Isles, hereditary great master of the household, hereditary keeper of Dunstaffnage, Carrick, and several other castles. He was also chancellor of the University of Aberdeen; and laboured to promote the interest of that, as well as of the other universities of Scotland. He particularly encouraged the school of physic at Edinburgh, which has now acquired so high a reputation. Having the chief management of Scotch affairs, he was also extremely attentive to promote the trade, manufactures, and improvements of his country. It was by his advice that, after the rebellion in 1745, the Highlanders were employed in the royal army. He was a man of great endowments both natural and acquired, well versed in the laws of his country, and pos-

essed considerable parliamentary abilities. He was Campbell. likewise eminent for his skill in human nature, had great talents for conversation, and had collected one of the most valuable private libraries in Great Britain. He built himself a very magnificent seat at Inverary. The faculties of his mind continued sound and vigorous till his death, which happened suddenly on the 15th of April 1761, in the 79th year of his age. He was married, but had no issue; and was succeeded in his titles and the estates of the family by John Campbell, fourth duke of Argyle, son of the honourable John Campbell of Mammore, who was the second son of Archibald the ninth earl of Argyle.

The family of Argyle was hereditary justice-general for Scotland till abolished by the jurisdiction act. They are still hereditary masters of the king's household in Scotland, and keepers of Dunstaffnage and Carrick.

CAMPBELL (John), an eminent historical, biographical, and political writer, was born at Edinburgh, March 8, 1707-8. His father, Robert Campbell of Glenlyon, Esq; was captain of horse in a regiment commanded by the then earl of Hyndford; and his mother, Elizabeth, daughter of — Smith, Esq; of Windsor in Berkshire, had the honour of claiming a descent from the poet Waller. Our author, their fourth son, was at the age of five years brought from Scotland to Windsor, where he received the first principles of his education; and at a proper age, he was placed out as clerk to an attorney, being intended for the law. This profession, however, he never followed; but by a close application to the acquisition of knowledge of various kinds, became qualified to appear with great advantage in the literary world. In 1736, before he had completed his 30th year, he gave to the public, in two volumes folio, "The Military History of Prince Eugene and the Duke of Marlborough," enriched with maps, plans, and cuts. The reputation hence acquired, occasioned him soon after to be solicited to take a part in the "Ancient Universal History." Whilst employed in this capital work, Mr Campbell found leisure to entertain the world with other productions. In 1739, he published the "Travels and Adventures of Edward Brown, Esq;" 8vo. In the same year appeared his "Memoirs of the Bashaw Duke de Ripperda," 8vo, reprinted, with improvements, in 1740. These memoirs were followed, in 1741, by the "Concise History of Spanish America," 8vo. In 1742, he was the author of "A Letter to a Friend in the Country, on the Publication of Thurloe's State Papers;" giving an account of their discovery, importance, and utility. The same year was distinguished by the appearance of the 1st and 2d volumes of his "Lives of the English Admirals, and other eminent British Seamen." The two remaining volumes were completed in 1744; and the whole, not long after, was translated into German. This was the first of Mr Campbell's works to which he prefixed his name; and it is a performance of great and acknowledged merit. In 1743, he published "Hermippus revived;" a second edition of which, much improved and enlarged, came out in 1749, under the following title: "Hermippus Redivivus: or, the Sage's Triumph over old Age and the Grave. Wherein a method is laid down for prolonging the life and vigour of man. Including a Commentary upon an ancient Inscription, in which this great secret is revealed; supported

Campbell ported by numerous authorities. The whole interspersed with a great variety of remarkable and well-attested relations." This extraordinary tract had its origin in a foreign publication; but it was wrought up to perfection by the additional ingenuity and learning of Mr Campbell. In 1744, he gave to the public in two volumes folio, his "Voyages and Travels," on Dr Harris's plan, being a very distinguished improvement of that collection which had appeared in 1705. The time and care employed by Mr Campbell in this important undertaking, did not prevent his engaging in another great work, the "Biographia Britannica," which began to be published in weekly numbers in 1745, and extended to seven volumes folio; but our author's articles were only in the first four volumes; of which, Dr Kippis observes, they constitute the prime merit.

When the late Mr Doddsley formed the design of "The Preceptor," which appeared in 1748, Mr Campbell was to assist in the undertaking; and the parts written by him were the Introduction to Chronology, and the Discourse on Trade and Commerce, both of which displayed an extensive fund of knowledge upon these subjects. In 1750, he published the first separate edition of his "Present State of Europe;" a work which had been originally begun in 1746, in the "Museum," a very valuable periodical performance, printed for Doddsley. There is no production of our author's that hath met with a better reception. It has gone through six editions, and fully deserved this encouragement. The next great undertaking which called for the exertion of our author's abilities and learning, was "The Modern Universal History." This extensive work was published, from time to time, in detached parts, till it amounted to 16 volumes folio; and a second edition of it, in 8vo, began to make its appearance in 1759. The parts of it written by Mr Campbell were, the histories of the Portuguese, Dutch, Spanish, French, Swedish, Danish, and Ostend Settlements in the East-Indies; and the Histories of the Kingdoms of Spain, Portugal, Algarve, Navarre, and that of France, from Clovis to 1656. As our author had thus distinguished himself in the literary world, the degree of LL.D. was very properly and honourably conferred upon him, June 18, 1754, by the university of Glasgow.

His principal and favourite work was, "A political survey of Great Britain," 2 vol. 4to, published a short time before his death; in which the extent of his knowledge, and his patriotic spirit, are equally conspicuous. Dr Campbell's reputation was not confined to his own country, but extended to the remotest parts of Europe. As a striking instance of this, it may be mentioned, that in the spring of 1774, the empress of Russia was pleased to honour him with the present of her picture, drawn in the robes worn in that country in the days of John Basiliowitz, grand duke of Muscovy, who was contemporary with queen Elizabeth. To manifest the doctor's sense of her imperial majesty's goodness, a sett of the "Political Survey of Britain," bound in Morocco, highly ornamented, and accompanied with a letter descriptive of the triumphs and felicities of her reign, was forwarded to St Petersburg, and conveyed into her hands by prince Orloff, who had resided some months in this kingdom.

Dr Campbell in 1736 married Elizabeth, daughter of Benjamine Vobe, of Leominster, in the county of Hereford, gentleman, with whom he lived nearly 40 years in the greatest conjugal harmony and happiness. So wholly did he dedicate his time to books, that he seldom went abroad: but to relieve himself as much as possible from the inconveniences incident to a sedentary life, it was his custom, when the weather would admit, to walk in his garden; or otherwise in some room of his house, by way of exercise. By this method, united with the strictest temperance in eating, and an equal abstemiousness in drinking, he enjoyed a good state of health, though his constitution was delicate. His domestic manner of living did not preclude him from a very extensive and honourable acquaintance. His house, especially on a Sunday evening, was the resort of the most distinguished persons of all ranks, and particularly of such as had rendered themselves eminent by their knowledge or love of literature. He received foreigners, who were fond of learning, with an affability and kindness which excited in them the highest respect and veneration; and his instructive and cheerful conversation made him the delight of his friends in general. He was, during the latter part of his life, agent for the province of Georgia in North America; and died at the close of the year 1775, in the 67th year of his age. The Doctor's literary knowledge was by no means confined to the subjects on which he more particularly treated as an author; he was well acquainted with the mathematics, and had read much in medicine. It hath been with great reason believed, that if he had dedicated his studies to the last science, he would have made a very conspicuous figure in the physical profession. He was eminently versed in the different parts of sacred literature; and his acquaintance with the languages extended not only to the Hebrew, Greek, and Latin among the ancient, and to the French, Italian, Spanish, Portuguese, and Dutch, among the modern; but likewise to the Oriental tongues. He was particularly fond of the Greek language. His attainment of such a variety of knowledge was exceedingly assisted by a memory surprisingly retentive, and which indeed astonished every person with whom he was conversant. In communicating his ideas, he had an uncommon readiness and facility; and the style of his works, which had been formed upon the model of that of the celebrated bishop Sprat, was perspicuous, easy, flowing, and harmonious. To all these accomplishments of the understanding, Dr Campbell joined the more important virtues of a moral and pious character. His disposition was gentle and humane, and his manners kind and obliging. He was the tenderest of husbands, a most indulgent parent, a kind master, a firm and sincere friend. To his great Creator he paid the constant and ardent tribute of devotion, duty, and reverence; and in his correspondences he showed that a sense of piety was always nearest his heart.

CAMPBELLTOWN, a parliament town of Argyle-shire in Scotland, seated on the lough of Kilkeran, on the eastern shore of Kintyre or Cantyre, of which it is the capital. It hath a good harbour; and is now a very considerable place, though within these 50 years only a petty fishing town. It has in fact been created by the fishery: for it was appointed the

Campden place of rendezvous for the buffes; and above 260 have been seen in the harbour at once. The inhabitants are reckoned to be upwards of 8000 in number. W. Long. 5. 10. N. Lat. 54.

Camp-huy-sen.

CAMPDEN, a small town of Gloucestershire in England, containing about 200 houses. It gives title of Viscount, by courtesy, to Earl of Gainsborough his son. W. Long. 1. 50. N. Lat. 52.

CAMPEACHY, a town of Mexico in South America, seated on the east coast of a bay of the same name, on the west of the province of Yucataro. It is defended by a good wall and strong forts; but is neither so rich, nor carries on such a trade, as formerly; it having been the port for the sale of logwood, the place where it is cut being about 30 miles distant. It was taken by the English in 1596; by the buccaners in 1678; and by the Flibusters of St Domingo in 1685, who set it on fire and blew up the citadel. W. Long. 93. 7. N. Lat. 19. 20.

CAMPREACHY-Wood, in botany. See *HÆMATOXYLUM*.

CAMPEN, a strong town of Overijssel in the United Provinces. It hath a citadel and a harbour; but the latter is almost choked up with sand. It was taken by the Dutch in 1578, and by the French in 1672; but they abandoned it the following year. It is seated near the mouth of the river Yssel and Zuider See. E. Long. 5. 35. N. Lat. 52. 38.

CAMPESTRE, in antiquity, a sort of cover for the privities, worn by the Roman soldiers in their field exercises; being girt under the navel, and hanging down to the knees. The name is supposed to be formed from *campus*, the field or place where the Roman soldiers performed their exercises.

CAMPHORA, or **CAMPHIRE**, a solid concrete juice extracted from the wood of the *laurus comphora*. See *LAURUS*, *CHEMISTRY*, and *MATERIA MEDICA*.

Pure camphire is very white, pellucid, somewhat unctuous to the touch; of a bitterish aromatic taste, yet accompanied with a sense of coolness; of a very fragrant smell, somewhat like that of rosemary, but much stronger. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, malignant and epidemical distempers. In deliria, also, where opiates could not procure sleep, but rather aggravated the symptoms, this medicine has often been observed to procure it. All these effects, however, Dr Cullen attributes to its sedative property, and denies that camphire has any other medicinal virtues than those of an antispasmodic and sedative. He allows it to be very powerful, and capable of doing much good or much harm. From experiments made on different brute creatures, camphire appears to be poisonous to every one of them. In some it produced sleep followed by death, without any other symptom. In others, before death, they were awakened into convulsions and rage. It seems, too, to act chiefly on the stomach; for an entire piece swallowed, produced the abovementioned effects with very little diminution of weight.

CAMPHUYSEN, (Dirk Theodore Raphael), an eminent painter, was born at Gorcum in 1586. He learned the art of painting from Diederick Govertze; and by a studious application to it, he very soon not only equalled, but far surpassed his master. He had an uncommon genius, and studied nature with care,

judgement, and assiduity. His subjects were landscapes, mostly small, with ruinous buildings, huts of peasants, or views of villages on the banks of rivers, with boats and hoys, and generally he represented them by moonlight. His pencil is remarkably tender and soft, his colouring true nature and very transparent, and his expertness in perspective is seen in the proportional distances of his objects, which are excellently contrived, and have a surprising degree of nature and truth. As he left off painting at an age when others are scarcely qualified to commence artists, few of his work are to be met with, and they bring considerable prices; as they cannot but give pleasure to the eye of every observer. He painted his pictures with a thin body of colour, but they are handled with singular neatness and spirit. He practised in his profession only till he was 18 years of age, and being then recommended as a tutor to the sons of the lord of Nieupoort, he undertook the employment, and discharged it with so much credit, that he was appointed secretary to that nobleman. He excelled in drawing with a pen; and the designs which he finished in that manner are exceedingly valued.

CAMPIAN (Edmund), an English Jesuit, was born at London, of indigent parents, in the year 1540; and educated at Christ's hospital, where he had the honour to speak an oration before queen Mary on her accession to the throne. He was admitted a scholar of St John's college in Oxford at its foundation, and took the degree of master of arts in 1564. About the same time he was ordained by a bishop of the church of England, and became an eloquent Protestant preacher. In 1566, when queen Elizabeth was entertained by the university of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy act in St Mary's church. In 1568, he was junior proctor of the university. In the following year, he went over to Ireland, where he wrote a history of that kingdom, and turned papist; but being found rather too assiduous in persuading others to follow his example, he was committed to prison. He soon, however, found means to make his escape. He landed in England in 1571; and thence proceeded to Doway in Flanders, where he publicly recanted his former heresy, and was created bachelor of divinity. He went soon after to Rome, where, in 1573, he was admitted of the society of Jesus, and was sent by the general of that order to Vienna, where he wrote his tragedy called *Nectar et ambrosia*, which was acted before the emperor with great applause.

From Vienna he went to Prague in Bohemia, where he resided in the Jesuits college about six years, and then returned to Rome. From thence, in 1580, he was sent by Pope Gregory XIII. with the celebrated Father Parsons, to convert the people of England. From Pitts we learn, that, some time before, several English priests, inspired by the Holy Ghost, had undertaken to convert their countrymen; that 80 of these foreign seminaries, besides several others who by God's grace had been converted in England, were actually engaged in the pious work with great success; that some of them had suffered imprisonment, chains, tortures, and ignominious death, with becoming constancy and resolution: but seeing at last that the labour was abundant and the labourers few, they solicited the assistance of the

Campian.

Campian
||
Campistron

Jesuits; requesting, that though not early in the morning, they would at least in the third, sixth, or ninth hour, send labourers into the Lord's vineyard. In consequence of this solicitation, the above two were sent to England. They arrived in an evil hour for Campian, at Dover; and were next day joyfully received by their friends at London. He had not been long in England, before Walsingham the secretary of state, being informed of his uncommon assiduity in the cause of the church of Rome, used every means in his power to have him apprehended, but for a long time without success. However, he was at last taken by one Elliot, a noted priest-taker, who found him in the house of Edward Yates, Esq; at Lyford in Berkshire, and conducted him in triumph to London, with a paper on his hat, on which was written *Campian the Jesuit*. He was imprisoned in the Tower; where, Wood says, "he did undergo many examinations, abuses, wrackings, tortures;" *exquisitissimis cruciatibus tortus*, says Pitts. It is hoped, for the credit of our reformers, this torturing part of the story is not true. The poor wretch, however, was condemned, on the statute 25 Ed. III. for high treason; and butchered at Tyburn, with two or three of his fraternity. Howsoever criminal in the eye of the law, or of the English gospel, might be the zeal of this Jesuit for the salvation of the poor heretics of this kingdom, biographers of each persuasion unite in giving him a great and amiable character. "All writers (says the Oxford antiquary), whether Protestants or Popish, say, that he was a man of admirable parts; an elegant orator, a subtle philosopher and disputant, and an exact preacher whether in English or the Latin tongue, of a sweet disposition, and a well-polished man." Fuller, in his church-history, says, "he was of a sweet nature, constantly carrying about him the charms of a plausible behaviour, of a fluent tongue, and good parts." His History of Ireland, in two books, was written in 1570; and published, by Sir James Ware, from a manuscript in the Cotton library, Dublin, 1633, folio. He wrote also *Chronologia universalis*, a very learned work; and various other tracts.

CAMPICURSIO, in the ancient military art, a march of armed men for several miles, from and back again to the camp, to instruct them in the military pace. This exercise was nearly akin to the *decurfio*, from which it only differed, in that the latter was performed by horsemen, the former also by foot.

CAMPIDOCORES, or CAMPIDUCTORES, in the Roman army, were officers who instructed the soldiery in the discipline and exercises of war, and the art of handling their weapons to advantage. These are also sometimes called *campigeni*, and *armidoctores*.

CAMPIDUCTOR, in middle-age writers, signifies the leader or commander of an army, or party.

CAMPION, in botany, the English name of the LYCHNIS.

CAMPION a town of the kingdom of Tanguth in Tartary. It was formerly remarkable for being a place through which the caravans passed in the road from Bukharia to China. E. Long. 104. 53. N. Lat. 40. 25.

CAMPISTRON, a celebrated French dramatic author, was born in 1656. Racine directed his poetical talents to the theatre, and assisted him in his first pieces. He died in 1723.

CAMPITÆ, in church history, an appellation given to the donatists, on account of their assembling in the fields for want of churches. For a similar reason, they were also denominated *Montenses* and *Rupitani*.

CAMPLI, or CAMPOLI, a town of Italy, in the kingdom of Naples, and in the farther Abruzzo, situated in E. Long. 13. 55. N. Lat. 42. 38.

CAMPO MAJOR, a town of the province of Alentejo in Portugal. W. Long. 7. 24. N. Lat. 38. 50.

CAMPREDON, a town of Catalonia in Spain, seated at the foot of the Pyrenean mountains. The fortifications were demolished by the French in 1691. W. Long. 1. 56. N. Lat. 42. 20.

CAMPS (Francis de), abbot of Notre Dame at Sigi, was born at Amiens in 1643; and distinguished himself by his knowledge of medals, by writing an history of France, and several other works. He died at Paris in 1723.

CAMPVERE, See VEER.

CAMPUS, in antiquity, a field or vacant plain in a city, not built upon, left vacant on account of shows, combats, exercises, or other uses of the citizens.

CAMPUS Maii, in ancient customs, an anniversary assembly of our ancestors held on May-day, when they confederated together for the defence of the kingdom against all its enemies.

CAMPUS Martius, a large plain in the suburbs of ancient Rome, lying between the Quirinal and Capitoline mounts and the Tiber, thus called because consecrated to the god Mars, and set apart for military sports and exercises to which the Roman youth were trained, as the use and handling of arms, and all manner of feats of activity. Here were the races run, either with chariots or single horses; here also stood the villa publica, or palace for the reception of ambassadors, who were not permitted to enter the city. Many of the public comitia were held in the same field, part of which was for that purpose cantoned out. The place was also nobly decorated with statues, arches, columns, porticoes, and the like structures.

CAMPUS Sceleratus, a place without the walls of ancient Rome, where the Vestals who had violated their vows of virginity were buried alive.

CAMUL, a town of Asia, on the eastern extremity of the kingdom of Cialus, on the frontiers of Tangut. E. Long. 98. 5. N. Lat. 37. 15.

CAMUS, a person with a low flat nose, hollowed in the middle.

The Tartars are great admirers of camus beauties. Rubruquis observes, that the wife of the great Jenghiz Khan, a celebrated beauty, had only two holes for a nose.

CAMUS (John Peter), a French prelate born in 1582. He was author of a number of pious romances (the taste of his time), and other theological works, to the amount of 200 vols. His definition of politics is remarkable: *Ars non tam regendi, quam fallendi, homines*; "the art not so much of governing, as of deceiving mankind." He died in 1652.

CAN, in the sea-language, as can-pump, a vessel wherewith seamen pour water into the pump to make it go.

CAN-Buoy. See BOUY.

CAN-Hook, an instrument used to sling a cask by the ends of the staves: it is formed by fixing a broad and flat

Campitas
||
Can.

Cana,
Canaan.

flat hook at each end of a short rope; and the tackle by which the cask so slung may be hoisted or lowered, is hooked to the middle of the rope.

CANA (anc. geog.), a town on the confines of the Upper and Lower Galilee: memorable for the turning water into wine (John). The birth place of Simeon, called *Cananite* from this place, and of Nathaniel.

CANAAN, the fourth son of Ham. The irreverence of Ham towards his father Noah is recorded in Gen. ix. Upon that occasion the patriarch cursed him in a branch of his posterity: "Cursed," says he, "be Canaan; a servant of servants shall he be unto his brethren." This curse being pronounced, not against Ham the immediate transgressor, but against his son, who does not appear, from the words of Moses, to have been any ways concerned in the crime, hath occasioned several conjectures. Some have believed that Noah cursed Canaan, because he could not well have cursed Ham himself, whom God had not long before blessed. Others think Moses's chief intent in recording this prediction was to raise the spirits of the Israelites, then entering on a terrible war with the children of Canaan, by the assurance, that, in consequence of the curse, that people were destined by God to be subdued by them. For the opinion of those who imagine all Ham's race were here accursed, seems repugnant to the plain words of Scripture, which confines the malediction to Canaan and his posterity; and is also contrary to fact. Indeed, the prophecy of Noah, that Canaan "should be a servant of servants to his brethren," seems to have been wholly completed in him. It was completed with regard to Shem, not only in that a considerable part of the seven nations of the Canaanites were made slaves to the Israelites, when they took possession of their land, as part of the remainder of them were afterwards enslaved by Solomon; but also by the subsequent expeditions of the Assyrians and Persians, who were both descended from Shem; and under whom the Canaanites suffered subjection, as well as the Israelites; not to mention the conquest of part of Canaan by the Elamites, or Persians, under Chedorlaomer, prior to them all. With regard to Japhet, we find a completion of the prophecy, in the successive conquests of the Greeks and Romans in Palestine and Phœnicia, where the Canaanites were settled; but especially in the total subversion of the Carthaginian power by the Romans; besides some invasions of the northern nations, as the posterity of Thogarma and Magog; wherein many of them, probably, were carried away captive.

The posterity of Canaan were very numerous. His eldest son was Sidon, who at least founded and peopled the city of Sidon, and was the father of the Sidonians and Phœnicians. Canaan had besides ten sons, who were the fathers of so many people, dwelling in Palestine, and in part of Syria; namely, the Hittites, the Jebusites, the Amorites, the Girgasites, the Hivites, the Arkites, the Sinites, the Arvadites, the Zemarites, and Hamathites.

Land of CANAAN, the country so named from Canaan the son of Ham. It lies between the Mediterranean sea and the mountains of Arabia, and extends from Egypt to Phœnicia. It is bounded to the east by the mountains of Arabia; to the south by the wil-

derness of Paran, Idumæa, and Egypt; to the west by the Mediterranean, called in Hebrew the Great Sea; to the north by the mountains of Libanus. Its length from the city of Dan (since called Cæsarea Philippi, or Paneadis, which stands at the foot of these mountains) to Beersheba, is about 70 leagues; and its breadth from the Mediterranean sea to the eastern borders, is in some places 30. This country, which was first called Canaan, from Canaan the son of Ham, whose posterity possessed it, was afterwards called Palestine, from the people which the Hebrews call Philistines, and the Greeks and Romans corruptly Palestines, who inhabited the sea coasts, and were first known to them. It likewise had the name of the *Land of Promise*, from the promise God made Abraham of giving it to him; that of the *Land of Israel*, from the Israelites having made themselves masters of it; that of *Judah*, from the tribe of Judah, which was the most considerable of the twelve; and lastly, the happiness it had of being sanctified by the presence, actions, miracles, and death of Jesus Christ, has given it the name of the *Holy Land*, which it retains to this day.

The first inhabitants of this land therefore were the Canaanites, who were descended from Canaan, and the eleven sons of that patriarch. Here they multiplied extremely; trade and war were their first occupations; these gave rise to their riches, and the several colonies scattered by them over almost all the islands and maritime provinces of the Mediterranean. The measure of their idolatry and abominations was completed, when God delivered their country into the hands of the Israelites. In St Athanasius's time, the Africans still said they were descended from the Canaanites; and it is said, that the Punic tongue was almost entirely the same with the Canaanitish and Hebrew language. The colonies which Cadmus carried into Thebes in Bœotia, and his brother Cilix into Cilicia, came from the stock of Canaan. The isles of Sicily, Sardinia, Malta, Cyprus, Corfu, Majorca and Minorca, Gades and Ebusus, are thought to have been peopled by the Canaanites. Bochart, in his large work entitled *Canaan*, has set all this matter in a good light.

Many of the old inhabitants of the north-west of the land of Canaan, however, particularly on the coast or territories of Tyre and Sidon, were not driven out by the children of Israel, whence this tract seems to have retained the name of Canaan a great while after those other parts of the country, which were better inhabited by the Israelites, had lost the said name. The Greeks called this tract inhabited by the old Canaanites along the Mediterranean sea, Phœnicia; the more inland parts, as being inhabited partly by Canaanites, and partly by Syrians, Syrophœnicia: and hence the woman said by St Matthew (xv. 22.) to be a woman of Canaan, whose daughter Jesus cured, is said by St Mark (vii. 26.) to be a Syrophœnician by nation, as she was a Greek by religion and language.

CANADA, or the province of Quebec, an extensive country of North America, bounded on the north-east by the gulph of St Lawrence, and St John's river; on the south-west, by lands inhabited by the savage Indians, which are frequently included in this province; on the south, by the provinces of Nova Scotia, New England, and New York; and on the

Canaan,
Canada.

Canada.

north-west, by other Indian nations. Under the name of *Canada*, the French comprehended a very large territory; taking into their claim part of New Scotland, New England, and New York on the east; and extending it on the west as far as the Pacific Ocean. That part, however, which was reduced by the British arms in the last war, lies between 61 and 81 degrees of west longitude, and between 45 and 52 of north latitude. The climate is not very different from that of the northern British colonies; but as it is much further from the sea, and more to the northward, than most of those provinces, it has a much severer winter, though the air is generally clear; and, like most of those American tracts that do not lie too far to the northward, the summers are very hot, and exceeding pleasant. The soil in general is very good, and in many parts extremely fertile; producing many different sorts of grains, fruits, and vegetables. The meadow grounds, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. The uncultivated parts are a continued wood, composed of prodigiously large and lofty trees, of which there is such a variety of species, that even of those who have taken most pains to know them, there is not perhaps one that can tell half the number. Canada produces, among others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and female maple; three sorts of ash-trees, the free, the mungrel, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech-trees and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which made out of one piece will contain 20 persons; others are made of the bark; the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; the ribs of these canoes are made of boughs of trees. In the hollow elms, the bears and wild cats take up their lodging from November to April. The country produces also a vast variety of other vegetables, particularly tobacco, which thrives well. Near Quebec is a fine lead mine, and many excellent ones of iron have been discovered. It hath also been reported that silver is found in some of the mountains. The rivers are extremely numerous, and many of them very large and deep. The principal are, the Ouattauais, St John's, Seguinay, Despaires, and Trois Rivières; but all these are swallowed up by the great river St Lawrence. This river issues from the lake Ontario; and, taking its course north-east, washes Montreal, where it receives the Ouattauais, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes so broad and so deep, that ships of the line contributed in the last war to reduce that city. After receiving in its progress innumerable streams, it at last falls into the ocean at cape Rosiers, where it is 90 miles broad, and where the cold is intense and the sea boisterous. This river is the only one upon which any settlements of note are as yet formed; but it is very probable, that, in time to come, Canada, and those vast regions to the west, may be enabled of them-

selfes to carry on a considerable trade upon the great lakes of fresh water which these countries environ. Here are five lakes, the least of which is of greater extent than the fresh-water lakes to be found in any other part of the world: these are the lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is about 300 leagues in circuit; as also is that of Michigan, though like lake Erie it is rather long, and comparatively narrow. But the lake Superior is larger than any of these, being not less than 500 leagues in circumference. All these are navigable by any vessels, and they all communicate with each other; but the passage between Erie and Ontario is interrupted by a most stupendous fall or cataract, called the *falls of Niagara**. The river St Lawrence, as already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French built forts at these several straits, by which the lakes communicate with one another, and on that where the last of them communicates with the river. By these, while the country was in their possession, they effectually secured to themselves the trade of the lakes, and preserved an influence over all the Indian nations that lie near them.

The most curious and interesting part of the natural history of Canada is the animals there produced. These are stags, elks, deer, bears, foxes, martins, wild cats, ferrets, weasels, large squirrels of a greyish hue, hares and rabbits. The southern parts, in particular, breed great numbers of wild bulls, divers sorts of roe bucks, goats, wolves, &c. The marshes, lakes, and pools, with which this country abounds, swarm with otters and beavers, of which the white are highly valued, as well as the right black kind. A vast variety of birds are also to be found in the woods; and the river St Lawrence abounds with such quantities of fish, that it is affirmed by some writers, this would be a more profitable article than even the fur-trade.—There are in Canada a multitude of different Indian tribes: but these are observed to decrease in number where the Europeans are most numerous; owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. Their manners and way of living we have already particularly described†. The principal towns are Quebec, Trois Rivières, and Montreal. The commodities required by the Canadians from Europe are, wine, or rather rum; cloths, chiefly coarse; linen; and wrought iron. The Indian trade requires rum, tobacco, a sort of duffil blankets, gums, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds. While the country was in possession of the French, the Indians supplied them with poultry; and the French had traders, who, like the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the furs, &c. home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. On this occasion many solemnities were observed, guards

Canada.

Canada.

were placed, and the governor assisted to preserve order in so great and various a concourse of savage nations. But sometimes great disorders and tumults happened; and the Indians frequently gave for a dram all that they were possessed of. It is remarkable, that many of these nations actually passed by the English settlement of Albany in New York, and travelled 200 miles further to Montreal, though they could have purchased the goods they wanted cheaper at the former.

Since Britain became possessed of Canada, our trade with that country has generally employed 34 ships and 400 seamen; their exports, at an average of three years, in skins, furs, ginseng, snake-root, capillaire, and wheat, amount to 150,000*l*. Their imports from Great Britain are computed at nearly the same sum. It will, however, be always impossible to overcome certain inconveniences arising from the violence of the winter. This is so excessive from December to April, that the broadest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Another inconvenience arises from the falls in the river St Lawrence below Montreal, which prevent ships from penetrating to that emporium of inland commerce. Our communication therefore with Canada, and the immense regions beyond it, will always be interrupted during the winter-season, until roads are formed that can be travelled without danger from the Indians. For these savage people often commit hostilities against us, without any previous notice; and frequently, without any provocation, they commit the most horrid ravages for a long time with impunity.

Canada was undoubtedly discovered by Sebastian CABOT, the famous Italian adventurer, who sailed under a commission from Henry VII. But though the English monarch did not think proper to make any use of this discovery, the French quickly attempted it; we have an account of their fishing for cod on the banks of Newfoundland, and along the sea-coast of Canada, in the beginning of the 16th century. About the year 1506, one Denys, a Frenchman, drew a map of the gulph of St Lawrence; and two years after, one Aubert, a ship-master of Dieppe, carried over to France some of the natives of Canada. As the new country, however, did not promise the same amazing quantities of gold and silver produced by Mexico and Peru, the French for some years neglected the discovery. At last, in the year 1523, Francis I. a sensible and enterprising prince, sent four ships, under the command of Verazani, a Florentine, to prosecute discoveries in that country. The particulars of this man's first expedition are not known. All we can learn is, that he returned to France, and next year he undertook a second. As he approached the coast, he met with a violent storm; however, he came so near as to perceive the natives on the shore, making friendly signs to him to land. This being found impracticable by reason of the surf upon the coast, one of the sailors threw himself into the sea; but, endeavouring to swim back to the ship, a surge threw him on shore without signs of life. He was, however, treated by the natives with such care and humanity, that he recovered his strength, and was allowed to swim back to the ship, which immediately returned to France. This is all we know of Vera-

Canada.

zani's second expedition. He undertook a third, but was no more heard of, and it is thought that he and all his company perished before he could form any colony. In 1534, one Jaques Cartier of St Maloes set sail under a commission from the French king, and on the 10th of May arrived at Cape Bonavista in Newfoundland. He had with him two small ships besides the one in which he sailed. He cruised along the coasts of that island, on which he discovered inhabitants, probably the Eskimaux. He landed in several places along the coast of the Gulf, and took possession of the country in the king's name. On his return, he was again sent out with a commission, and a pretty large force: he returned in 1535, and passed the winter at St Croix; but the season proved so severe, that he and his companions must have died of the scurvy, had they not, by the advice of the natives, made use of the decoction of the tops and bark of the white pines. As Cartier, however, could produce neither gold nor silver, all that he could say about the utility of the settlement was disregarded; and in 1540, he was obliged to become pilot to one M. Roberval, who was by the French king appointed viceroy of Canada; and who sailed from France with five vessels. Arriving at the gulph of St Lawrence, they built a fort; and Cartier was left to command the garrison in it, while Roberval returned to France for additional recruits to his new settlement. At last, having embarked in 1549, with a great number of adventurers, neither he nor any of his followers were heard of more.

This fatal accident so greatly discouraged the court of France, that, for 50 years, no measure were taken for supplying with necessaries the settlers that were left. At last, Henry IV. appointed the Marquis de la Roche lieutenant-general of Canada and the neighbouring countries. In 1598 he landed on the isle of Sable, which he absurdly thought to be a proper place for a settlement, though it was without any port, and without product except briars. Here he left about 40 malefactors, the refuse of the French jails. After cruising for some time on the coast of Nova Scotia, without being able to relieve these poor wretches, he returned to France, where he died of a broken heart. His colony must have perished, had not a French ship been wrecked on the island, and a few sheep driven upon it at the same time. With the boards of the ship they erected huts; and while the sheep lasted they lived on them, feeding afterwards on fish. Their clothes wearing out, they made coats of seal-skins; and in this miserable condition they spent seven years, when Henry ordered them to be brought to France. The king had the curiosity to see them in their seal-skin dresses, and was so moved with their appearance, that he forgave them all their offences, and gave each of them 50 crowns to begin the world anew.

In 1600, one Chauvin, a commander in the French navy, attended by a merchant of St Malo, called *Pontgrave*, made a voyage to Canada, from whence he returned with a very profitable quantity of furs. Next year he repeated the voyage with the same good fortune, but died while he was preparing for a third. The many specimens of profit to be made by the Canadian trade, at last induced the public to think favourably of it. An armament was equipped, and the command of it given to Pontgrave, with powers to extend his discoveries.

Canal.

veries up the river St Lawrence. He sailed in 1603, having in his company Samuel Champlain, who had been a captain in the navy, and was a man of parts and spirit. It was not, however, till the year 1608, that the colony was fully established. This was accomplished by founding the city of Quebec, which from that time commenced the capital of all the settlements in Canada. The colony, however, for many years continued in a low way, and was often in danger of being totally exterminated by the Indians. As the particulars of these wars, however, could neither be entertaining, nor indeed intelligible, to many of our readers, we choose to omit them, and in general observe, that the French not only concluded a permanent peace with the Indians, but so much ingratiated themselves with them, that they could with the greatest ease prevail upon them at any time to murder and scalp the English in their settlements. These practices had a considerable share in bringing about the last war with France, when the whole country was conquered by the British in 1761. The most remarkable transaction in this conquest was the siege of QUEBEC; for a particular account of which, see that article. And for the transactions here during the late American war, see AMERICA (United States of), n^o 195, 200—207.

CANAL of COMMUNICATION, an artificial cut in the ground, supplied with water from rivers, springs, &c. in order to make a navigable communication betwixt one place and another.

The particular operations necessary for making artificial navigations depend upon a number of circumstances. The situation of the ground; the vicinity or connection with rivers; the ease or difficulty with which a proper quantity of water can be obtained; these and many other circumstances necessarily produce great variety in the structure of artificial navigations, and augment or diminish the labour and expence of executing them. When the ground is naturally level, and unconnected with rivers, the execution is easy, and the navigation is not liable to be disturbed by floods: but, when the ground rises and falls, and cannot be reduced to a level, artificial methods of raising and lowering vessels must be employed; which likewise vary according to circumstances.

A kind of temporary sluices are sometimes employed for raising boats over falls or shoals in rivers by a very simple operation. Two posts or pillars of mason-work, with grooves, are fixed, one on each bank of the river, at some distance below the shoal. The boat having passed these posts, planks are let down across the river by pulleys into the grooves, by which the water is dammed up to a proper height for allowing the boat to pass up the river over the shoal.

The Dutch and Fleemings at this day sometimes, when obstructed by cascades, form an inclined plane or rolling-bridge upon dry land, alongst which their vessels are drawn from the river below the cascade into the river above it. This, it is said, was the only method employed by the ancients, and is still used by the Chinese, who are said to be entirely ignorant of the nature and utility of locks. These rolling-bridges consist of a number of cylindrical rollers which turn easily on pivots, and a mill is commonly built near by, so that the same machinery may serve the double purpose of working the mill and drawing up vessels.

Canal.

A **Lock** is a basin placed lengthwise in a river or canal, lined with walls of masonry on each side, and terminated by two gates, placed where there is a cascade or natural fall of the country; and so constructed, that the basin being filled with water by an upper sluice to the level of the waters above, a vessel may ascend thro' the upper gate; or the water in the lock being reduced to the level of the water at the bottom of the cascade, the vessel may descend through the lower gate; for when the waters are brought to a level on either side, the gate on that side may be easily opened. But as the lower gate is strained in proportion to the depth of water it supports, when the perpendicular height of the water exceeds 12 or 13 feet, more locks than one become necessary. Thus, if the fall be 17 feet, two locks are required, each having $8\frac{1}{2}$ feet fall; and if the fall be 26 feet, three locks are necessary, each having 8 feet 8 inches fall. The side-walls of a lock ought to be very strong. Where the natural foundation is bad, they should be founded on piles and platforms of wood: they should likewise slope outwards, in order to resist the pressure of the earth from behind.

Plate CXIV. fig. 1. A perspective view of part of a canal: the vessel L, within the lock AC.—Fig. 2. Section of an open lock: the vessel L about to enter.—Fig. 3. Section of a lock full of water; the vessel L raised to a level with the water in the superior canal.—Fig. 4. Ground section of a lock. L, a vessel in the inferior canal. C, the under gate. A, the upper gate. GH, a subterraneous passage for letting water from the superior canal run into the lock. KF, a subterraneous passage for water from the lock to the inferior canal.

X and Y (fig. 1.) are the two flood-gates, each of which consists of two leaves, resting upon one another, so as to form an obtuse angle, in order the better to resist the pressure of the water. The first (X) prevents the water of the superior canal from falling into the lock; and the second (Y) dams up and sustains the water in the lock. These flood-gates ought to be very strong, and to turn freely upon their hinges. In order to make them open and shut with ease, each leaf is furnished with a long lever A b, A b; C b, C b. They should be made very tight and close, that as little water as possible may be lost.

By the subterraneous passage G H (fig. 2, 3, & 4) which descends obliquely, by opening the sluice G, the water is let down from the superior canal D into the lock, where it is stopt and retained by the gate C when shut, till the water on the lock comes to be on a level with the water in the superior canal D; as represented, fig. 3. When, on the other hand, the water contained by the lock is to be let out, the passage G H must be shut by letting down the sluice G, the gate A must be also shut, and the passage K F opened by raising the sluice K: a free passage being thus given to the water, it descends through K F, into the inferior canal, until the water in the lock is on a level with the water in the inferior canal B; as represented, fig. 2.

Now, let it be required to raise the vessel L (fig. 2) from the inferior canal B to the superior one D; if the lock happens to be full of water, the sluice G must be shut, and also the gate A, and the sluice K opened,

Canal.

Canal.

so that the water in the lock may run out till it is on a level with the water in the inferior canal B. When the water in the lock comes to be on a level with the water at B, the leaves of the gate C are opened by the levers C b, which is easily performed, the water on each side of the gate being in equilibrio; the vessel then sails into the lock. After this the gate C and the sluice K are shut, and the sluice G opened, in order to fill the lock, till the water in the lock, and consequently the vessel, be upon a level with the water in the superior canal D; as is represented in fig. 3. The gate A is then opened, and the vessel passes into the canal D.

Again, let it be required to make a vessel descend from the canal D into the inferior canal B. If the lock is empty, as in fig. 2. the gate C and sluice K must be shut, and the upper sluice G opened, so that the water in the lock may rise to a level with the water in the upper canal D. Then open the gate A, and let the vessel pass thro' into the lock. Shut the gate A and the sluice G; then open the sluice K, till the water in the lock be on a level with the water in the inferior canal; then the gate C is opened, and the vessel passes along into the canal B, as was required.

It is almost needless to spend time in enumerating the many advantages which necessarily result from artificial navigations. Their utility is now so apparent, that most nations in Europe give the highest encouragement to undertakings of this kind wherever they are practicable. The advantages of navigable canals did not escape the observation of the ancients. From the most early accounts of society we read of attempts to cut through large isthmuses, in order to make a communication by water, either betwixt different nations, or distant parts of the same nation, where land-carriage was long and expensive. Herodotus relates, that the Cnidians, a people of Caria in Asia Minor, designed to cut the isthmus which joins that peninsula to the continent; but were superstitious enough to give up the undertaking, because they were interdicted by an oracle. Several kings of Egypt attempted to join the Red-Sea to the Mediterranean. Cleopatra was exceedingly fond of this project. Soliman II. emperor of the Turks, employed 50,000 men in this great work. This canal was completed under the caliphate of Omar, but was afterwards allowed to fall into disrepair; so that it is now difficult to discover any traces of it. Both the Greeks and Romans intended to make a canal across the Isthmus of Corinth, which joins the Morea and Achaia, in order to make a navigable passage by the Ionian sea into the Archipelago. Demetrius, Julius Cæsar, Caligula, and Nero, made several unsuccessful efforts to open this passage. But, as the ancients were entirely ignorant of the use of water-locks, their whole attention was employed in making level cuts, which is probably the principal reason why they so often failed in their attempts. Charlemagne formed a design of joining the Rhine and the Danube, in order to make a communication between the ocean and the Black Sea, by a canal from the river Almutz which discharges itself into the Danube, to the Reditz, which falls into the Maine, and this last falls into the Rhine near Mayence: for this purpose he employed a prodigious number of workmen; but he met with so

many obstacles from different quarters, that he was obliged to give up the attempt.

The French at present have many fine canals: that of Briare was begun under Henry IV. and finished under the direction of cardinal Richelieu in the reign of Louis XIII. This canal makes a communication betwixt the Loire and the Seine by the river Loing. It extends 11 French great leagues from Briare to Montargis. It enters the Loire a little above Briare, and terminates in the Loing at Cepoi. There are 42 locks on this canal.

The canal of Orleans, for making another communication between the Seine and the Loire, was begun in 1675, and finished by Philip of Orleans, regent of France, during the minority of Louis XV. and is furnished with 20 locks. It goes by the name of the *canal of Orleans*; but it begins at the village of Combleux, which is a short French league from the town of Orleans.

But the greatest and most useful work of this kind is the junction of the ocean with the Mediterranean by the canal of Languedoc. It was proposed in the reigns of Francis I. and Henry IV. and was undertaken and finished under Louis XIV. It begins with a large reservoir 4000 paces in circumference, and 24 feet deep, which receives many springs from the mountain Noire. This canal is about 64 leagues in length, is supplied by a number of rivulets, and is furnished with 104 locks, of about eight feet rise each. In some places it passes over bridges of vast height; and in others it cuts thro' solid rocks for 1000 paces. At one end it joins the river Garonne near Tholouse, and terminates at the other in the lake Tau, which extends to the port of Cette. It was planned by Francis Riquet in the 1666, and finished before his death, which happened in the 1680.

In the Dutch, Austrian, and French Netherlands, there is a very great number of canals; that from Bruges to Ostend carries vessels of 200 tons.

The Chinese have also a great number of canals; that which runs from Canton to Peking extends about 825 miles in length, and was executed about 800 years ago.

It would be an endless task to describe the numberless canals in Holand, Russia, Germany, &c. We shall therefore confine ourselves to those that are either already finished, or at present executing, in our own country.

As the promoting of commerce is the principal intention of making canals, it is natural to expect that their frequency in any nation should bear some proportion to the trade carried on in it, providing the situation of the country will admit of them. The present state of England and Scotland confirms this observation. Though the Romans made a canal between the Nyne, a little below Peterborough, and the Witham, three miles below Lincoln, which is now almost entirely filled up, yet it is not long since canals were revived in England. They are now however become very numerous, particularly in the counties of York, Lincoln, and Cheshire. Most of the counties betwixt the mouth of the Thames and the Bristol channel are connected together either by natural or artificial navigations; those upon the Thames and Isis reaching within about

Canal.

20 miles of those upon the Severn. The duke of Bridgewater's canal in Cheshire runs 27 miles on a perfect level; but at Barton it is carried by a very high aqueduct bridge over the Irwell, a navigable river; so that it is common for vessels to be passing at the same time both under and above the bridge. It is likewise cut some miles into the hills, where the Duke's coal-mines are wrought.

A navigable canal betwixt the Forth and Clyde in Scotland, and which divides the kingdom in two parts, was first thought of by Charles II. for transports and small ships of war; the expence of which was to have been L. 500,000, a sum far beyond the abilities of his reign. It was again projected in the year 1722, and a survey made; but nothing more done till 1761, when the then Lord Napier, at his own expence, caused make a survey, plan, and estimate on a small scale. In 1764, the trustees for fisheries, &c. in Scotland caused make another survey, plan, and estimate of a canal five feet deep, which was to cost L. 79,000. In 1766, a subscription was obtained by a number of the most respectable merchants in Glasgow, for making a canal four feet deep and twenty-four feet in breadth; but when the bill was nearly obtained in Parliament, it was given up on account of the smallness of the scale, and a new subscription set on foot for a canal seven feet deep, estimated at L. 150,000. This obtained the sanction of Parliament; and the work was begun in 1768 by Mr Smeaton the engineer. The extreme length of the canal from the Forth to the Clyde is 35 miles, beginning at the mouth of the Carron, and ending at Dalmure Burnfoot on the Clyde, six miles below Glasgow, rising and falling 160 feet by means of 39 locks, 20 on the east side of the summit, and 19 on the west, as the tide does not ebb so low in Clyde as in the Forth by nine feet. Vessels drawing eight feet water, and not exceeding nineteen feet beam and seventy-three feet in length, pass with ease, the canal having afterwards been deepened to upwards of eight feet. The whole enterprise displays the art of man in a high degree. The carrying the canal through moss, quicksand, gravel, and rocks, up precipices and over valleys, was attended with inconceivable difficulties. There are eighteen draw-bridges and fifteen aqueduct bridges of note, besides small ones and tunnels. In the first three miles there are only six locks; but in the fourth mile there are no less than ten locks, and a very fine aqueduct bridge over the great road to the west of Falkirk. In the next six miles there are only four locks, which carry you to the summit. The canal then runs eighteen miles on a level, and terminates about a mile from Glasgow. In this course, for a considerable way the ground is banked about twenty feet high, and the water is sixteen feet deep, and two miles of it is made through a deep moss. At Kirkintulloch, the canal is carried over the water of Logie on an aqueduct arch of ninety feet broad. This arch was thrown over in three stretches, having only a centre of thirty feet, which was shifted on small rollers from one stretch to another; a thing new, and never attempted before with an arch of this size; yet the joinings are as fairly equal as any other part, and admired as a very fine piece of masonry. On each side there is a very considerable banking over the valley. The work was carried on till it came within six miles of its junction with

N^o 62.

the Clyde; when the subscription and a subsequent loan being exhausted, the work was stopt in 1775. The city of Glasgow, however, by means of a collateral branch, opened a communication with the Forth, which has produced a revenue of about L. 6000 annually; and, in order to finish the remaining six miles, the government in 1784 gave L. 50,000 out of the forfeited estates, the dividends arising from this sum to be applied to making and repairing roads in the Highlands of Scotland. Accordingly the work has been resumed; and by contract, under a high penalty, must be entirely completed in November 1789. The aqueduct bridge over the Kilven (now finished, and supposed the greatest of the kind in the world) consists of four arches, and carries the canal over a valley 65 feet high and 420 in length, exhibiting a very singular effort of human ingenuity and labour. To supply the canal with water was of itself a very great work. There is one reservoir of 50 acres 24 feet deep, and another of 70 acres 22 feet deep, into which many rivers and springs terminate, which it is thought will afford sufficient supply of water at all times. This whole undertaking when finished will cost about L. 200,000. It is the greatest of the kind in Britain, and without doubt will be of great national utility; though it is to be regretted that it had not been executed on a still larger scale, the locks being too short for transporting large masts.

CANAL, in anatomy, a duct or passage through which any of the juices flow.

CANANOR, a large maritime town of Asia, on the coast of Malabar, in a kingdom of the same name, with a very large and safe harbour. It formerly belonged to the Portuguese, and had a strong fort to guard it; but in 1683, the Dutch, together with the natives, drove them away; and after they became masters of the town, enlarged the fortifications. They have but a very small trade; but there is a town at the bottom of the bay independent of the Dutch, whose prince can bring 20,000 men into the field. The Dutch fort is large, and the governor's lodgings are at a good distance from the gate; so that, when there was a skirmish between the factory and the natives, he knew nothing of it till it was over. E. Long. 78. 10. N. Lat. 12. 0.

CANANOR, a small kingdom of Asia, on the coast of Malabar, whose king can raise a considerable army. The natives are generally Mahometans; and the country produces pepper, cardamons, ginger, mirobolans, and tamarinds, in which they drive a considerable trade.

CANARA, a kingdom of Asia, on the coast of Malabar. The inhabitants are Gentoos, or Pagans; and there is a pagod, or temple, called *Ramtrut*, which is visited every year by a great number of pilgrims. Here the custom of burning the wives with their husbands had its beginning, and is practised to this day. The country is generally governed by a woman who keeps her court at a town called *Baydor*, two days journey from the sea. She may marry whom she pleases; and is not obliged to burn with her husband, like her female subjects. They are so good observers of their laws, that a robbery or murder is scarce ever heard of among them. The Canarans have forts built of earth along the coast, which are garrisoned with 200 or 300 soldiers, to guard against the robberies of their neighbours.

lands.

bours. The lower grounds yield every year two crops of corn or rice; and the higher produce pepper, betel nuts, sanders wood, iron, and steel. The Portuguese clergy here live very loosely, and make no scruple of procuring women for strangers.

CANARIA (anc. geog.), one of the Fortunate Islands, a proof that these were what are now called the *Canaries*. Canaria had its name from its abounding with dogs of an enormous size, two of which were brought to Juba king of Mauritania. See the following article.

CANARIA, or the GRAND CANARY, an island in the Atlantic Ocean, about 180 miles from the coast of Africa. It is about 100 miles in circumference, and 33 in diameter. It is a fruitful island, and famous for the wine that bears its name. It also abounds with apples, melons, oranges, citrons, pomegranates, figs, olives, peaches, and plantains. The fir and palm trees are the most common. The towns are, Canary the capital, Gualdera, and Geria.

CANARY, or CIVIDAD DE PALMAS, is the capital of the island of Canaria, with an indifferent castle, and a bishop's see. It has also a court of inquisition, and the supreme council of the rest of the Canary-islands; as also four convents, two for men and two for women. The town is about three miles in compass, and contains 12,000 inhabitants. The houses are only one story high, and flat at the top; but they are well built. The cathedral is a handsome structure. W. Long. 15. 20. N. Lat. 28. 4.

CANARY-Islands, are situated in the Atlantic ocean, over against the empire of Morocco in Africa. They were formerly called the *Fortunate Islands*, on account of the temperate healthy air, and excellent fruits. The land is very fruitful, for both wheat and barley produce 130 for one. The cattle thrive well, and the woods are full of all sorts of game. The Canary singing birds are well known all over Europe. There are here sugar-canes in great abundance; but the Spaniards first planted vines here, from whence we have the wine called *Canary* or *Sack*.

These islands were not entirely unknown to the ancients; but they were a long while forgot, till John de Betencourt discovered them in 1402. It is said they were first inhabited by the Phœnicians, or Carthaginians, but on no certain foundation; nor could the inhabitants themselves tell from whence they were derived; on the contrary, they did not know there was any other country in the world. Their language, manners, and customs, had no resemblance to those of their neighbours. However, they were like the people on the coast of Barbary in complexion. They had no iron. After the discovery, the Spaniards soon got possession of them all, under whose dominions they are to this day, except Madeira, which belongs to the Portuguese. The inhabitants are chiefly Spaniards; though there are some of the first people remaining, whom they call *Guanches*, who are somewhat civilized by their intercourse with the Spaniards. They are a hardy, active, bold people, and live on the mountains. Their chief food is goat's milk. Their complexion is tawny, and their noses flat. The Spanish vessels, when they sail for the West Indies, always rendezvous at these islands, going and coming. Their number is 12. 1. Alegranza; 2. Canaria; 3. Ferro; 4. Fuerteventura; 5. Gomera; 6. Gratiósa; 7. Lancerotta; 8. Madeira; VOL. IV. Part I.

9. Palma; 10. Rocca; 11. Salvages; 12. Teneriff. West longitude from 12. to 21. north latitude from 27. 30. to 29. 30.

CANARY-Bird. See FRINGILLA. These birds are much admired for their singing, and take their name from the place from whence they originally came, viz. the Canary-islands; but of late years there is a sort of birds brought from Germany, and especially from Tirol, and therefore called *German birds*, which are much better than the others; though both are supposed to have originally come from the same place. The cocks never grow fat, and by some country people cannot be distinguished from common green-birds; though the Canary-birds are much lustier, have a longer tail, and differ much in the heaving of the passages of the throat when they sing. These birds being so much esteemed for their song, are sometimes sold at a high price, according to the goodness and excellency of their notes; so that it will always be advisable to hear one sing before he is bought. In order to know whether he is in good health, take him out of the store-cage, and put him in a clean cage by himself; if he stand up boldly, without crouching or shrinking in his feathers, look with a brisk eye, and is not subject to clap his head under his wing, it is a sign that he is in good health; but the greatest matter is to observe his dunging: if he bolts his tail like a nightingale after he has dunged, it is a sign he is not in good health, or at least that he will soon be sick; but if his dung be very thin like water, or of a slimy white without any blackness in it, it is a sign of approaching death. When in perfect health, his dung lies round and hard, with a fine white on the outside, dark within, and dries quickly; though a seed-bird seldom dungs so hard, unless he is very young.

Canary-birds are subject to many diseases, particularly imposthumes, which affect the head, cause them to fall suddenly from the perch, and die in a short time, if not speedily cured. The most approved medicine is an ointment made of fresh butter and capon's grease melted together. With this the top of the bird's head is to be anointed for two or three days, and it will dissolve the imposthume: but if the medicine has been too long delayed, then, after three or four times anointing, see whether the place of his head be soft; and if so, open it gently, and let out the matter, which will be like the yolk of an egg; when this is done, anoint the place, and the bird will be cured. At the same time he must have figs with his other food, and in his water a slice or two of liquorice, with white sugar-candy.

Canary-birds are distinguished by different names at different times and ages: such as are about three years old are called *runts*; those above two are named *eriffs*; those of the first year under the care of the old ones, are termed *branchers*; those that are new-flown, and cannot feed themselves, *pushers*; and those brought up by hand, *nestlings*.

The Canary-birds may be bred with us; and, if treated with proper care, they will become as vigorous and healthful as in the country from whence they have their name. The cages in which these birds are kept are to be made either of walnut-tree or oak, with bars of wire; because these, being woods of strength, do not require to be used in large pieces.

L

The

Canary-
bird.

Canary-
birds.

The common shape of cages, which is cylindric, is very improper for these birds; for this allows little room to walk, and without that the birds usually become melancholy. The most proper of all shapes is the high and long, but narrow.

If these birds eat too much, they grow over-fat, lose their shape, and their singing is spoiled; or at least they become so idle, that they will scarce ever sing. In this case their victuals is to be given them in a much smaller quantity, and they will by this means be recovered by degrees to all their beauty, and will sing as at first.

At the time that they are about to build their nests, there must be put into their cages some hay, dried thoroughly in the sun: with this must be mixed some moss dried in the same manner, and some stag's hair; and great care is to be taken of breeding the young, in the article of food. As soon as the young birds are eight days old, or somewhat more, and are able to eat and pick up food of themselves, they are to be taken out of the cage in which they were hatched, and each put separately into another cage, and hung up in a room where it may never have an opportunity of hearing the voice of any other bird. After they have been kept thus about eight days, they are to be excited to sing by a bird-pipe; but this is not to be blowed too much, or in too shrill a manner, lest they sing themselves to death.

For the first fifteen days the cages are to be covered with a black cloth, and for the fifteen days following with a green one. Five lessons in a day from the pipe are sufficient for these young creatures; and they must not be disturbed with several sounds at the same time, lest they confound and puzzle them: two lessons should be given them early in the morning, one about the middle of the day, and two more at night.

The genius and temper of the several birds of this kind are very different. The males are almost always melancholy, and will not sing unless they are excited to it by hearing others continually singing about them. The male bird of this kind will often kill the female put to him for breeding; and when there are several females together with the males, they will often do the same to one another from jealousy. It is therefore not easy to manage the article of their breeding well in this particular, unless in this manner: let two female birds be put into one cage, and when they have lived together some time, they will have contracted a sort of love for one another, which will not easily be dissolved. Put a male bird into the cage with these two, and every thing will go well; their friendship will keep them from quarrelling about his favours, and from danger of his mischievous disposition; for if he attacks one of them, in order to kill her, the other will immediately take her part; and after a few of these battles, the male will find that they are together an overmatch for him at fighting, and will then distribute his favours to them, and there will not fail of being a young breed or two, which are to be taken away from their parents, and educated as before directed. Some males watch the time of the female's laying, and devour the eggs as fast as she deposits them; and others take the young ones in their beak as soon as hatched, and crush them to death against the sides of the cage, or some other way destroy them. When a male has

been known once to have been guilty of this, he is to be shut up in a small cage, in the middle of the large one in which the female is breeding her young, and thus he will often comfort her with singing all day long, while she sits upon the eggs or takes care of the young ones; and when the time of taking away, to put them into separate cages, is come, the male is to be let out, and he will always after this live in friendship with the female.

If the male become sick during the time of the female's sitting or bringing up her young, he must be removed immediately, and only brought to the side of her cage at certain times, that she may see him, till he is perfectly cured; and then he is to be shut up again in his cage in the middle.

Canary-birds are various in their notes; some having a sweet song, others a lowish note, others a long song, which is best, as having the greatest variety of notes: but they sing chiefly either the titlark or nightingale notes. See *Song of Birds*.

CANCALLE, a town of France, in Upper Brittany, by the sea-side, where there is a road. Here the British landed in 1758, in their way to St Maloes, where they burnt a great number of ships in the harbour, and then retired without loss. This town was in their power; but they acted like generous enemies, and did no hurt to this nor any other on the coast. W. Long. 9. 13. N. Lat. 48. 41.

CANCELIER, in falconry, is when a light brown hawk, in her stooping, turns two or three times upon the wing, to recover herself before she seizes.

CANCELLI, a term used to denote lattice windows, of those made of cross bars disposed latticewise; it is also used for rails or ballusters inclosing the communion-table, a court of justice, or the like, and for the network in the inside of hollow bones.

CANCELLING, in the civil law, an act whereby a person consents that some former deed be rendered null and void. This is otherwise called *rescission*. The word comes from the Latin *cancellare* to encompass or pale a thing round. In the proper sense of the word, to cancel, is to deface an obligation, by passing the pen from top to bottom, or across it; which makes a kind of chequer lattice, which the Latins call *cancelli*.

CANCER, in zoology, a genus of insects belonging to the order of insecta aptera. The generic characters are these: they have eight legs, (seldom ten or six), besides the two large claws which answer the purpose of hands. They have two eyes at a considerable distance from each other, and for the most part supported by a kind of pedunculi or footstalks; the eyes are likewise elongated and moveable; they have two clawed palpi, and the tail is jointed. This genus includes the lobster, shrimp, &c. There are no less than 87 species of cancer, distinguished principally by the length of their tails and the margins of their breasts. The following are the most remarkable.

1. The gammarus, or common lobster, with a smooth thorax, short ferrated snout; very long antennæ; and between them two shorter ones, bifid; claws and fangs large, the greater tuberculated, the lesser ferrated on the inner edge; four pair of legs; six joints in the tail; tail-fins rounded. It inhabits all the rocky shores of our island, but chiefly where there is a depth of water. In Llyn in Caernarvonshire a certain small lobster,

Cancalle
||
Cancer.Common
lobster.

Cancer.

ster, nothing different except in size, burrows in the sand. They are brought in vast quantities from the Orkney isles, and many parts of the eastern coast of Scotland, to the London markets. Sixty or seventy thousand are annually brought from the neighbourhood of Montrose alone.—The lobster was well known to the ancients, and is well described by Aristotle under the name of *ασαλον*. It is found as far as the Hellespont; and is called at Constantinople *liczula* and *licpuda*.

Lobsters fear thunder, and are apt to cast their claws on a great clap: it is said that they will do the same on the firing of a great gun; and that, when men of war meet a lobster boat, a jocular threat is used, that, if the master does not sell them good lobsters, they will *salute him*.

The habitation of this species is in the clearest water, at the foot of rocks that impend over the sea. This has given opportunity of examining more closely into the natural history of the animal, than of many others who live in an element that prohibits most of the human researches, and limits the inquiries of the most inquisitive. Some lobsters are taken by hand; but the greater quantity in pots, a sort of trap formed of twigs, and baited with garbage; they are formed like a wire mouse-trap, so that when the lobster gets in, there is no return. These are fastened to a cord sunk in the sea, and their place marked by a buoy.—They begin to breed in the spring, and continue breeding most part of the summer. They propagate *more humano*, and are extremely prolific. Dr Baister says he counted 12,444 eggs under the tail, besides those that remained in the body unprotruded. They deposit those eggs in the sand, where they are soon hatched.

Lobsters change their crust annually. Previous to their putting off their old one, they appear sick, languid, and restless. They totally acquire a new coat in a few days; but during the time that they remain defenceless, they seek some very lonely place, for fear of being devoured by such of their brethren as are not in the same situation. It is also remarkable, that lobsters and crabs will renew their claws, if by accident they are torn off; and it is certain they will grow again in a few weeks, though they never attain to the size of the first. They are very voracious animals, and feed on sea-weeds, garbage, and all sorts of dead bodies. The pincers of one of the lobsters large claws are furnished with knobs, and those of the other are always serrated. With the former it keeps firm hold of the stalks of submarine plants, and with the latter it cuts and minces its food very dexterously. The knobbed or *numb* claw, as the fishermen call it, is sometimes on the right and sometimes on the left side indifferently. It is more dangerous to be seized by them with the cutting claw than the other; but, in either case, the quickest way to get disengaged from the creature is to pull off its claw. The female or *hen* lobster does not cast her shell the same year that she deposits her ova, or, in the common phrase, is in *berry*. When the ova first appear under her tail, they are small, and extremely black; but they become in succession almost as large as ripe elder-berries before they are deposited, and turn of a dark brown colour, especially towards the end of the time of her depositing them. They continue full, and depositing the ova in constant succession, as long as any of that black substance can be found in their body,

Cancer.

which, when boiled, turns of a beautiful red colour, and is called their *coral*. Hen-lobsters are found in berry at all times of the year, but chiefly in winter. It is a common mistake, that a berried hen is always in perfection for the table. When her berries appear large and brownish, she will always be found exhausted, watery, and poor. Though the ova be cast at all times of the year, they seem only to come to life during the warm summer months of July and August. Great numbers of them may then be found, under the appearance of tadpoles, swimming about the little pools left by the tides among the rocks, and many also under their proper form from half an inch to four inches in length. In casting their shells, it is hard to conceive how the lobster is able to draw the fish of their large claws out, leaving the shells entire and attached to the shell of their body, in which state they are constantly found. The fishermen say, the lobster pines before casting, till the fish of its large claw is no thicker than the quill of a goose, which enables it to draw its parts through the joints and narrow passage near the trunk. The new shell is quite membranaceous at first, but hardens by degrees. Lobsters only grow in size while their shells are in their soft state. They are chosen for the table, by their being heavy in proportion to their size; and by the hardness of their shells on their sides, which, when in perfection, will not yield to moderate pressure. Barnacles and other small fish adhering to them are reckoned certain signs of superior goodness. Cock-lobsters are in general better than the hens in winter; they are distinguished by the narrowness of their tails, and by their having a strong spine upon the centre of each of the transverse processes beneath the tail, which support the four middle plates of their tails. The fish of a lobster's claw is more tender, delicate, and easy of digestion, than that of the tail. In summer, the lobsters are found near the shore, and thence to about six fathoms water; in winter, they are seldom taken in less than 12 or 15 fathoms. Like other insects, they are much more active and alert in warm weather than in cold. In the water, they can run nimbly upon their legs or small claws; and, if alarmed, can spring, tail foremost, to a surprising distance, as swift as a bird can fly. The fishermen can see them pass about 30 feet; and, by the swiftness of their motion, suppose they may go much further. Athenæus remarks this circumstance, and says, that "the incurvated lobsters will spring with the activity of dolphins." Their eyes are raised upon moveable bases, which enables them to see readily every way. When frightened, they will spring from a considerable distance to their hold in the rock, and, what is not less surprising than true, will throw themselves into their hold in that manner through an entrance barely sufficient for their bodies to pass.

2. The strigofus, or plated lobster, with a pyramidal spiny snout; thorax elegantly plated, each plate marked near its junction with short striæ; claws much longer than the body, thick, echinated, and tuberculated; the upper fang trifid; only three legs spiny on their sides; tail broad. The largest of this species is about six inches long. It inhabits the coasts of Anglesea, under stones and fuci. It is very active; and, if taken, flaps its tail against the body with much violence and noise.

3. The astacus, or craw-fish, with a projecting snout

Cancer.
Crown fish,
prawn,
shrimp, &c.

slightly serrated on the sides; a smooth thorax; back smooth, with two small spines on each side; claws large, beset with small tubercles; two first pair of legs clawed, the two next subulated; tail consisting of five joints; the caudal fins rounded. It inhabits many of the rivers in England, lodged in holes which they form in the clayey banks. Cardan says, that this species indicates the goodness of water; for in the best water they are boiled into the reddest colour.

4. The serratus, or prawn, with a long serrated snout bending upwards; three pair of very long filiform feelers; claws small, furnished with two fangs; smooth thorax; five joints to the tail; middle caudal fin subulated, two outmost flat and rounded. It is frequent in several shores among loose stones; sometimes found at sea, and taken on the surface over 30 fathoms depth of water; cinereous when fresh, of a fine red when boiled.

5. The crangon, or shrimp, with long slender feelers, and between them two projecting laminae; claws with a single, hooked, moveable fang; three pair of legs; seven joints in the tail; the middle caudal fin subulated, the four others rounded and fringed, a spine on the exterior side of each of the outmost. It inhabits the shores of Britain in vast quantities, and is the most delicious of the genus.

6. The squilla, with a snout like a prawn, but deeper and thinner; the feelers longer in proportion to the bulk; the sub-caudal fins rather larger; is, at full growth, not above half the bulk of the former.—It inhabits the coasts of Kent; and is sold in London under the name of the *white shrimp*, as it assumes that colour when boiled.

7. The atomos, or atom-lobster, with a slender body; filiform antennae; three pair of legs near the head; behind which are two pair of oval vesiculae; beyond are three pair of legs, and a slender tail between the last pair. It is very minute, and the help of the microscope is often necessary for its inspection.

8. The pulex, or flea lobster, with five pair of legs, and two claws, imperfect; with 12 joints of the body. It is very common in fountains and rivulets; swims very swiftly in an incurvated posture on its back; embraces and protects its young between the legs; does not leap.

9. The locust, or locust-lobster, with four antennae; two pair of imperfect claws; the first joint ovated; body consists of 14 joints, in which it differs from the former. It abounds, in summer, on the shores, beneath stones and algae; leaps about with vast agility.

Hermit-crab.

10. The diogenes, soldier-crab, or hermit-crab, with rough claws; the left claw is the longest (this being the only difference between the *diogenes* and *bernardus*); the legs are subulated, and serrated along the upper ridge; the tail naked and tender, and furnished with a hook by which it secures itself in its lodging. This species is parasitic; and inhabits the empty cavities of turbinated shells, changing its habitation according to its increase of growth from the small *nerite* to the large *whelk*. Nature denies it the strong covering behind, which it hath given to others of this class; and therefore directs it to take refuge in the deserted cases of other animals. They crawl very fast with the shell on their back; and at the approach of danger draw themselves within the shell, and, thrusting out the larger claw,

will pinch very hard whatever molests them. Aristotle describes it very exactly under the name of *καρκινίον*. By the moderns it is called the *soldier*, from the idea of its dwelling in a tent; or the *hermit*, from retiring into a cell.

It is very diverting to observe this animal when wanting to change its shell. The little soldier is seen busily parading the shore along that line of pebbles and shells which is formed by the extremest wave; still, however, dragging its old incommodious habitation at its tail, unwilling to part with one shell, even though a troublesome appendage, till it can find another more convenient. It is seen stopping at one shell, turning it, and passing it by; going on to another, contemplating that for a while, and then slipping its tail from its old habitation to try on the new: this also is found to be inconvenient, and it quickly returns to its old shell again. In this manner it frequently changes, till at last it finds one light, roomy, and commodious; to this it adheres, though the shell be sometimes so large as to hide the body of the animal, claws and all. Yet it is not till after many trials, and many combats also, that the soldier is thus completely equipped; for there is often a contest between two of them for some well-looking favourite shell for which they are rivals. They both endeavour to take possession; they strike with their claws, they bite each other, till the weakest is obliged to yield by giving up the object of dispute. It is then that the victor immediately takes possession, and parades it in his new conquest three or four times back and forward upon the strand before his envious antagonist. When this animal is taken, it sends forth a feeble cry, endeavouring to seize the enemy with its nippers; which if it fastens upon, it will sooner die than quit the grasp.

The hermit-crabs frequent mostly those parts of the sea-shores which are covered with shrubs and trees, producing various wild fruits on which they subsist; though they will also feed on the fragments of fish and other animal substances cast on shore. When roasted in the shell, they are esteemed delicate. The hermit-crab, hung in the air, dissolves into a kind of oil, which speedily cures the rheumatism, if rubbed upon the part.

11. The vocans, or sand-crab, is but of a small size; its colour light brown, or dusky white. It has eight legs, and two claws, one of which is double the size of the other: these claws serve both to defend and to feed themselves with. The head has two square holes, which are receptacles for its eyes; out of which it thrusts them, and draws them in again at pleasure. Their abode is only on the sandy shores of Ilathera, and many others of the Bahama islands. They run very fast, and retreat from danger into little holes they make in the sand.

12. The grapsus, or red mottled crab, hath a round body, the legs longer and larger than in other kinds; the claws red; except which, the whole is mottled in a beautiful manner with red and white. These crabs inhabit the rocks hanging over the sea; they are the nimblest of all others, and run with surprising agility along the upright side of a rock, and even under the rocks that hang horizontally below the water. This they are often necessitated to do for escaping the assaults of rapacious birds that pursue them. These crabs never

Cancer.

Cancer.

Cancer.

Hermit Crab.

Horrid Crab.

Violet Crab.

Plated Lobster.

Cancer.

Cancer.

never go to land; but frequent mostly those parts of the promontories and islands of rocks in and near the sea, where, by the continual and violent agitation of the waves against the rocks, they are always wet, continually receiving the spray of the sea, which often washes them into it; but they instantly return to the rock again, not being able to live under water, and yet requiring more of that element than any of the crustaceous kinds that are not fish.

13. The *granulatus*, or rough-shelled crab: these crabs are pretty large, and are commonly taken from the bottom of the sea in shallow water; the legs are small in proportion to the body; the two claws are remarkably large and flat. The whole shell is covered over with innumerable little tubercles like shagreen: the colour is brown, variously stained with purple.

14. The *cancer erythropus*, or red-claw crab, is of a small size, and brown colour; it hath two claws of unequal bigness, red at the ends; and eight legs, which seem of less use to them than in other crabs; for when on the ground, they crawl with slow pace, dragging their bodies along; but they are mostly seen grasping with their claws, and hanging to some sea-plant, or other marine substance.

15. The *pisum*, or pea-crab, with rounded and smooth thorax, entire and blunt; with a tail of the size of the body, which commonly is the bulk of a pea. It inhabits the muscle, and has unjustly acquired the repute of being poisonous. The swelling after eating of muscles is wholly constitutional; for one that is affected by it, hundreds remain uninjured. Crabs either of this kind, or allied to them, the ancients believed to have been the consentaneous inmates of the *Pinnæ*, and other bivalves; which, being too stupid to perceive the approach of their prey, were warned of it by their vigilant friend. Oppian tells the fable prettily.

In clouded deeps below, the *pinna* hides,
And through the silent paths obscurely glides;
A stupid wretch, and void of thoughtful care,
He forms no bait, nor lays the tempting snare;
But the dull sluggard boasts a *crab* his friend,
Whose busy eyes the coming prey attend.
One room contains them, and the partners dwell
Beneath the convex of one sloping shell;
Deep in the watry vast the comrades rove,
And mutual interest binds their constant love;
That wiser friend the lucky juncture tells,
When in the circuit of his gaping shells
Fish wand'ring enter; then the bearded guide
Warns the dull mate, and pricks his tender side;
He knows the hint, nor at the treatment grieves,
But hugs th' advantage, and the pain forgives;
His closing shells the *pinna* sudden joins,
And 'twixt the pressing sides his prey confines:
Thus fed by mutual aid, the friendly pair
Divide their gains, and all the plunder share.

16. The *mænas*, or common crab, with three notches on the front; five serrated teeth on each side; claws ovated; next joint toothed; hind feet subulated; dirty green colour; red when boiled. It inhabits all our shores; and lurks under the algæ, or burrows under the sand. Is sold, and eaten by the poor of our capitals.

17. The *pagurus*, or black clawed crab, with a cre-

nated thorax; smooth body; quinque-dentated front; smooth claws and black tips; hind feet subulated. It inhabits the rocky coasts; is the most delicious meat of any; casts its shell between Christmas and Easter. The tips of the claws of this species are used in medicine; intended to absorb acidities in the stomach and bowels.

18. The *velutinus*, or velvet crab, with the thorax quinque-dentated; body covered with short, brown, velvet-like pile; claws covered with minute tubercles; small spines round the top of the second joint; hind legs broadly ovated.—This is among the species taken notice of by Aristotle on account of the broad feet, which, he says, assist them in swimming; as web-feet do the water-fowl. It inhabits the western coast of Anglesea.

19. The *horridus*, or horrid-crab, with a projecting bifurcated snout, the end diverging; body heart-shaped; with the claws and legs covered with long and very sharp spines.—It is a large species, and inhabits the rocks on the eastern coasts of Scotland. It is common to Norway and Scotland, as many of the marine animals and birds are.

20. The *uricola*, land-crab, or violet-crab, with Violet- a smooth entire thorax, and the two last joints of the crab- feet armed with spines. It inhabits the Bahama islands, as well as most lands between the tropics; and feeds upon vegetables.

These animals live not only in a kind of orderly society in their retreats in the mountains, but regularly once a year march down to the sea-side in a body of some millions at a time. As they multiply in great numbers, they choose the month of April or May to begin their expedition; and then sally out by thousands from the stumps of hollow trees, from the clefts of rocks, and from the holes which they dig for themselves under the surface of the earth. At that time the whole ground is covered with this band of adventurers; there is no setting down one's foot without treading upon them. The sea is their place of destination, and to that they direct their march with right-lined precision. No geometrician could send them to their destined station by a shorter course; they neither turn to the right nor left, whatever obstacles intervene; and even if they meet with a house, they will attempt to scale the walls to keep the unbroken tenor of their way. But though this be the general order of their route, they, upon other occasions, are obliged to conform to the face of the country; and if it is intersected with rivers, they are then seen to wind along the course of the stream. The procession sets forward from the mountains with the regularity of an army under the guidance of an experienced commander. They are commonly divided into three battalions; of which the first consists of the strongest and boldest males, that, like pioneers, march forward to clear the route and face the greatest dangers. These are often obliged to halt for want of rain, and to go into the most convenient encampment till the weather changes. The main body of the army is composed of females, which never leave the mountains till the rain is set in for some time, and then descend in regular battalia, being formed into columns of 50 paces broad, and three miles deep, and so close that they almost cover the ground. Three or four days after this, the rear-guard follows, a straggling

Cancer.

gling undisciplined tribe, consisting of males and females, but neither so robust nor so vigorous as the former. The night is their chief time of proceeding; but if it rains by day, they do not fail to profit by the occasion; and they continue to move forward in their slow uniform manner. When the sun shines and is hot upon the surface of the ground, they then make an universal halt, and wait till the cool of the evening. When they are terrified, they march back in a confused disorderly manner, holding up their nippers, with which they sometimes tear off a piece of the skin, and then leave the weapon where they inflicted the wound. They even try to intimidate their enemies; for they often clatter their nippers together, as if it were to threaten those that come to disturb them. But tho' they thus strive to be formidable to man, they are much more so to each other; for they are possessed of one most unfocial property, which is, that if any of them by accident is maimed in such a manner as to be incapable of proceeding, the rest fall upon and devour it on the spot, and then pursue their journey.

When, after a fatiguing march, and escaping a thousand dangers, (for they are sometimes three months in getting to the shore), they have arrived at their destined port, they prepare to cast their spawn. The peas are as yet within their bodies, and not excluded as is usual in animals of this kind, under the tail; for the creature waits for the benefit of sea-water to help the delivery. For this purpose the crab has no sooner reached the shore, than it eagerly goes to the edge of the water, and lets the waves wash over its body two or three times. This seems only a preparation for bringing their spawn to maturity; for, without farther delay, they withdraw to seek a lodging upon land: in the mean time the spawn grows larger, is excluded out of the body, and sticks to the barbs under the flap, or more properly the tail. This bunch is seen as big as an hen's egg, and exactly resembling the roes of herrings. In this state of pregnancy they once more seek the shore for the last time; and shaking off their spawn into the water, leave accident to bring it to maturity. At this time whole shoals of hungry fish are at the shore in expectation of this annual supply; the sea to a great distance seems black with them; and about two thirds of the crabs eggs are immediately devoured by these rapacious invaders. The eggs that escape are hatched under the sand; and, soon after, millions at a time of these little crabs are seen quitting the shore, and slowly travelling up to the mountains. The old ones, however, are not so active to return; they have become so feeble and lean, that they can hardly creep along, and the flesh at that time changes its colour. The most of them, therefore, are obliged to continue in the flat parts of the country till they recover, making holes in the earth, which they cover at the mouth with leaves and dirt, so that no air may enter. There they throw off their old shells, which they leave, as it were, quite whole; the place where they opened on the belly being unseen. At that time they are quite naked, and almost without motion for six days together, when they become so fat as to be delicious food. They have then under their stomachs four large white stones, which gradually decrease in proportion as the shell hardens, and, when

they come to perfection, are not to be found. It is at that time that the animal is seen slowly making its way back; and all this is most commonly performed in the space of six weeks.

This animal, when possessed of its retreats in the mountains, is impregnable: for, only subsisting upon vegetables, it seldom ventures out; and its habitation being in the most inaccessible places, it remains for a great part of the season in perfect security. It is only when impelled by the desire of bringing forth its young, and when compelled to descend into the flat country, that it is taken. At that time the natives wait for its descent in eager expectation, and destroy thousands; but, disregarding their bodies, they only seek for that small spawn which lies on each side of the stomach within the shell, of about the thickness of a man's thumb. They are much more valuable upon their return after they have cast their shell; for, being covered with a skin resembling soft parchment, almost every part except the stomach may be eaten. They are taken in the holes by feeling for them with an instrument; they are sought after by night, when on their journey, by flambeaux. The instant the animal perceives itself attacked, it throws itself on its back, and with its claws pinches most terribly whatever it happens to fasten on. But the dexterous crab-catcher takes them by the hinder legs in such a manner that the nippers cannot touch him, and thus he throws them into his bag. Sometimes also they are caught when they take refuge in the bottoms of holes in rocks by the sea-side, by clapping a stick at the mouth of the hole, which prevents their getting out; and then soon after, the tide coming, enters the hole, and the animal is found, upon its retiring, drowned in its retreat.

These crabs are of various sizes, the largest about six inches wide; they walk side-ways like the sea-crab, and are shaped like them: some are black, some yellow, some red, and others variegated with red, white, and yellow mixed. Some of these are poisonous; and several people have died of eating of the crabs, particularly of the black kind. The light-coloured are reckoned best; and when full in flesh, are very well tasted. In some of the sugar islands they are eat without danger; and are no small help to the negro slaves, who, on many of these islands, would fare very hard without them.

CANCER, in medicine, a roundish, unequal, hard, and livid tumour, generally seated in the glandulous parts of the body, supposed to be so called, because it appears at length with turgid veins shooting out from it, so as to resemble, as it is thought, the figure of a crab-fish; or, others say, because, like that fish, where it has once got, it is scarce possible to drive it away. See (the *Index* subjoined to) MEDICINE.

CANCER, in astronomy, one of the twelve signs, represented on the globe in the form of a crab, and thus marked (♋) in books. It is the fourth constellation in the starry zodiac, and that from which one quadrant of the ecliptic takes its denomination. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab-fish. As the latter walks backwards, so the former, in this part of his course, begins to go backwards, or recede from us; though the

disposi-

Cancer.

Cancherizante.
||
Candahar.

disposition of stars in this sign is by others supposed to have given the first hint to the representation of a crab.

Tropic of CANCER, in astronomy, a lesser circle of the sphere parallel to the equator, and passing through the beginning of the sign Cancer.

CANCHERIZANTE, or *CANCHERIZATO*, in the Italian music, a term signifying a piece of music that begins at the end, being the retrograde motion from the end of a song, &c. to the beginning.

CANCROMA, or *BOAT-BILL*, in ornithology, a genus of birds belonging to the order of *Grallæ*; the characters of which are: The bill is broad, with a keel along the middle; the nostrils are small, and lodged in a furrow; the tongue is small; and the toes are divided. There are two species:

1. The *Cochlearia*, or Crested Boat-bill, is of the size of a fowl; the length 22 inches. The bill is four inches long, and of a singular form, not unlike a boat with the keel uppermost, or, as some think, like the bowls of two spoons, placed with the hollow parts together; the upper mandible has a prominent ridge at the top, and on each side of this a long channel, at the bottom of which the nostrils are placed; these are oval, and situated obliquely; the general colour of the bill is dusky, or in some specimens dark brown; the skin between the under jaw capable of distension: from the hind head springs a long black crest, the feathers which compose it narrow, and end in a point; the middle ones are six inches in length, the others lessen by degrees, the outer ones being not more than one inch: between the bill and eye the skin is bare and dusky; the plumage on the forehead white; the rest of the bird of a pale bluish ash-colour; across the lower part of the neck behind is a transverse band of brownish black, which passes forwards on each side towards the breast, ending in a point, but does not encompass it: the fore part of the neck, and under parts, are bluish white, except the belly and thighs, which are rufous: the feathers which hang over the breast are loose, like those of the heron: the tail is three inches and a half long, and the wings, when closed, reach nearly to the end of it: the leg is three inches in length; and the thigh, from its insertion to the knee, four; the middle toe two inches and a half; the bare part above the knee one inch and a half: the colour of the bare parts yellowish brown; claws black: the toes are connected at the base by a membrane, which, as in the umbrell, is deepest in the outer one.—It inhabits Cayenne, Guiana, and Brasil, and chiefly frequents such parts as are near the water: in such places it perches on the trees which hang over the streams, and, like the kingfisher, drops down on the fish which swim beneath. It has been thought to live on crabs likewise, whence the Linnæan name

2. The *Cancrophaga*, or Brown Boat-bill, a distinct species, according to Linnæus, but which Mr Latham considers as only a variety, is of the size of the former; the head and crest the same; the upper parts, instead of ash-colour, are of a pale rufous brown; the tail rufous ash; and the under parts wholly of a cream colour; the bill and legs of a yellow brown. Its place and manners the same with those of the preceding.

CANDAHAR, a province of Persia, bounded on the north by the province of Balk; on the east, by

that of Cabul; on the south, by Buchor and Sablestan; and on the west, by Sigestan. There have been bloody wars between the Indians and Persians on account of this province; but in 1650 it fell to the Persians. The inhabitants are known by the name of *Aghuans*, or *Affghans*, who have often endeavoured to throw off the yoke. But, in 1737, they were severely punished for such an attempt. See *PERSIA*.

CANDAHAR, the capital of the above province, is seated on a mountain; and being a place of great trade, has a considerable fortress. The caravans that travel from Persia and the parts about the Caspian sea to the East Indies, choose to pass through Candahar, because there is no danger of being robbed on this road, and provisions are very reasonable. The religion is Mahometanism, but there are many Banians and Guebres. E. Long. 67. 5. N. Lat. 33. 0.

CANDAULES, the last king of Lydia, of the family of the Heraclides. See *LYDIA*.

CANDELARES (from *candela* a candle), the name of an order in the former editions of Linnæus's *Fragments of a natural method*, consisting of these three genera, *rhizophora*, *nyssa*, and *mimusops*. They are removed, in the latter editions, into the order *HOLORACEÆ*; which see.

CANDIA, the modern name of the island of Crete (see *CRETE*). The word is a variation of *Khunda*, which was originally the Arabian name of the metropolis only, but in time came to be applied to the whole island.

Candia came into the possession of the Venetians by purchase in the year 1194, as related under the article *CRETE*; and soon began to flourish under the laws of that wise republic. The inhabitants, living under the protection of a moderate government, and being encouraged by their masters, engaged in commerce and agriculture. The Venetian commandants readily afforded to those travellers who visited the island, that assistance which is necessary to enable them to extend and improve useful knowledge. Belon, the naturalist, is lavish in praise of their good offices, and describes, in an interesting manner, the flourishing state of that part of the island which he visited.

The seat of government was established at Candia. The magistrates and officers, who composed the council, resided there. The provisor-general was president. He possessed the chief authority; and his power extended over the whole principality. It continued in the possession of the Venetians for five centuries and an half. Cornaro held the chief command at the time when it was threatened with a storm, on the side of Constantinople. The Turks, for the space of a year, had been employed in preparing a vast armament. They deceived the Venetian, by assuring him that it was intended against Malta. In the year 1645, in the midst of a solemn peace, they appeared unexpectedly before Crete with a fleet of 400 sail, having on board 60,000 land forces, under the command of four pachas. The emperor Ibrahim, under whom this expedition was undertaken, had no fair pretext to offer in justification of his enterprize. He made use of all that perfidy which characterizes the people of the east, to impose on the Venetian senate. He loaded their ambassador with presents, directed his fleet to bear for Cape Matapan, as if they had been going beyond the

Candahar
||
Candia.

Candia.

Archipelago; and caused the governors of Tina and Cerigna to be solemnly assured, that the republic had nothing to fear for her possessions. At the very instant when he was making those assurances, his naval armament entered the gulf of Canea; and, passing between that city and St Theodore, anchored at the mouth of Platania.

The Venetians, not expecting this sudden attack, had made no preparations to repel it. The Turks landed without opposition. The isle of St Theodore is but a league and an half from Canea. It is only three quarters of a league in compass. The Venetians had erected two forts there; one of which, standing on the summit of the highest eminence, on the coast of that little isle, was called Turluru; the other, on a lower situation, was named St Theodore. It was an important object to the Mussulmans to make themselves masters of that rock, which might annoy their ships. They immediately attacked it with ardour. The first of those fortresses, being destitute of soldiers and cannon, was taken without striking a blow. The garrison of the other consisted of no more than 60 men. They made a gallant defence, and stood out till the last extremity; and when the Turks at last prevailed, their number was diminished to ten, whom the captain-pacha cruelly caused to be beheaded.

Being now masters of that important post, as well as of Lazaret, an elevated rock, standing about half a league from Canea, the Turks invested the city by sea and land. General Cornaro was struck, as with a thunder-clap, when he learned the descent of the enemy. In the whole island there were no more than a body of 3500 infantry, and a small number of cavalry. The besieged city was defended only by 1000 regular troops, and a few citizens, who were able to bear arms. He made haste to give the republic notice of his distress; and posted himself off the road, that he might the more readily succour the besieged city. He threw a body of 250 men into the town, before the lines of the enemy were completed. He afterwards made several attempts to strengthen the besieged with other reinforcements; but in vain. The Turks had advanced in bodies close to the town, had carried a half-moon battery, which covered the gate of Retimo; and were battering the walls night and day with their numerous artillery. The besieged defended themselves with resolute valour, and the smallest advantage which the besiegers gained cost them dear. General Cornaro made an attempt to arm the Greeks, particularly the Spachiots, who boasted loudly of their valour. He formed a battalion of these. But the æra of their valour was long past. When they beheld the enemy, and heard the thunder of the cannon, they took to flight; not one of them would stand fire.

While the senate of Venice were deliberating on the means to be used for relieving Canea, and endeavouring to equip a fleet, the Mahometan generals were sacrificing the lives of their soldiers to bring their enterprise to a glorious termination. In different engagements they had already lost 20,000 warriors; but, descending into the ditches, they had undermined the walls, and blown up the most impregnable forts with explosions of powder. They sprung one of those mines beneath the bastion of St Demetri. It overturned a considerable part of the wall, which crushed all the

Nº 63.

defenders of the bastion. That instant the besiegers sprung up with their sabres in their hands, and taking advantage of the general consternation of the besieged on that quarter, made themselves masters of the post. The besieged, recovering from their terror, attacked them with unequalled intrepidity. About 400 men assailed 2000 Turks already firmly posted on the wall, and pressed upon them with such obstinate and dauntless valour, that they killed a great number, and drove the rest down into the ditch. In this extremity, every person in the city was in arms. The Greek monks took up muskets; and the women, forgetting the delicacy of their sex, appeared on the walls among the defenders, either supplying the men with ammunition and arms, or fighting themselves; and several of those daring heroines lost their lives.

For 50 days the city held out against all the forces of the Turks. If, even at the end of that time, the Venetians had sent a naval armament to its relief, the kingdom of Candia might have been saved. Doubtless, they were not ignorant of this well known fact. The north wind blows straight into the harbour of Canea. When it blows a little briskly, the sea rages. It is then impossible for any squadron of ships, however numerous, to form in line of battle in the harbour, and to meet an enemy. If the Venetians had set out from Cerigo with a fair wind, they might have reached Canea in five hours, and might have entered the harbour with full sails, without being exposed to one cannon-shot; while none of the Turkish ships would have dared to appear before them; or if they had ventured, must have been driven back on the shore, and dashed in pieces among the rocks. But, instead of thus taking advantage of the natural circumstances of the place, they sent a few galleys, which, not daring to double Cape Spada, coasted along the southern shore of the island, and failed of accomplishing the design of their expedition.

At last, the Canceans, despairing of relief from Venice, seeing three breaches made in their walls, thro' which the infidels might easily advance upon them, exhausted with fatigue, and covered with wounds, and reduced to the number of 500 men, who were obliged to scatter themselves round the walls, which were half a league in extent, and undermined in all quarters, demanded a parley, and offered to capitulate. They obtained very honourable conditions; and after a glorious defence of two months, which cost the Turks 20,000 men, marched out of the city with the honours of war. Those citizens, who did not chuse to continue in the city, were permitted to remove; and the Ottomans, contrary to their usual practice, faithfully observed their stipulations.

The Venetians, after the loss of Canea, retired to Retimo. The captain-pacha laid siege to the citadel of the Sude, situated in the entrance of the bay, on an high rock, of about a quarter of a league in circumference. He raised earthen-batteries, and made an ineffectual attempt to level its ramparts. At last, despairing of taking it by assault, he left some forces to block it up from all communication, and advanced towards Retimo. That city, being unwallled, was defended by a citadel, standing on an eminence which overlooks the harbour. General Cornaro had retired thither. At the approach of the enemy, he advanced

5

from

Candia.

Candia. from the city, and waited for them in the open field. In the action, inattentive to his own safety, he encouraged the soldiers, by fighting in the ranks. A glorious death was the reward of his valour; but his fall determined the fate of Retimo.

The Turks having landed additional forces on the island, they introduced the plague, which was almost a constant attendant on their armies. This dreadful pest rapidly advanced, and, like a devouring fire, wasting all before it, destroyed most part of the inhabitants. The rest, fleeing in terror before its ravages, escaped into the Venetian territories, and the island was left almost desolate.

The siege of the capital commenced in 1646, and was protracted much longer than that of Troy. Till the year 1648, the Turks scarce gained any advantages before that city. They were often routed by the Venetians, and sometimes compelled to retire to Retimo. At that period Ibrahim was solemnly deposed, and his eldest son, at the age of nine years, was raised to the throne, under the name of Mahomet IV. Not satisfied with confining the sultan to the horrors and obscurity of a dungeon, the partizans of his son strangled him on the 19th of August, in the same year. That young prince, who mounted the throne by the death of his father, was afterwards expelled from it, and condemned to pass the remainder of his life in confinement.

In the year 1649, Ussuin Pacha, who blockaded Candia, receiving no supplies from the Porte, was compelled to raise the siege, and retreat to Canea. The Venetians were then on the sea with a strong squadron. They attacked the Turkish fleet in the bay of Smyrna, burnt 12 of their ships and 2 galleys, and killed 6000 of their men. Some time after, the Mahometans having found means to land an army on Candia, renewed the siege of the city with greater vigour, and made themselves masters of an advanced fort that was very troublesome to the besieged; which obliged them to blow it up.

From the year 1650 till 1658, the Venetians, continuing masters of the sea, intercepted the Ottomans every year in the straits of the Dardanelles, and fought them in four naval engagements; in which they defeated their numerous fleets, sunk a number of their caravels, took others, and extended the terror of their arms even to the walls of Constantinople. That capital became a scene of tumult and disorder. The Grand Signior, alarmed, and trembling for his safety, left the city with precipitation.

Such glorious success revived the hopes of the Venetians, and depressed the courage of the Turks. They converted the siege of Candia into a blockade, and suffered considerable losses. The Sultan, in order to exclude the Venetian fleet from the Dardanelles, and to open to his own navy a free and safe passage, caused two fortresses to be built at the entrance of the straits. He gave orders to the Pacha of Canea to appear again before the walls of Candia, and to make every possible effort to gain the city. In the mean time, the republic of Venice, to improve the advantages which they had gained, made several attempts on Canea. In 1660, that city was about to surrender to their arms, when the Pacha of Rhodes, hastening to its relief, reinforced the defenders with a body of 2000 men. He happily

VOL. IV. Part I.

Candia. doubled the extremity of Cape Melec, though within sight of the Venetian fleet, which was becalmed off Cape Spada, and could not advance one fathom to oppose an enemy considerably weaker than themselves.

Kiopruli, son and successor to the visir of that name, who had long been the support of the Ottoman empire, knowing that the murmurs of the people against the long continuance of the siege of Candia were rising to an height, and fearing a general revolt, which would be fatal to himself and his master, set out from Byzantium about the end of the year 1666 at the head of a formidable army. Having escaped the Venetian fleet, which was lying off Canea with a view to intercept him, he landed at *Palio Castro*, and formed his lines around Candia. Under his command were four Pachas, and the flower of the Ottoman forces. Those troops, being encouraged by the presence and the promises of their chiefs, and supported by a great quantity of artillery, performed prodigies of valour. All the exterior forts were destroyed. Nothing now remained to the besieged but the bare line of the walls, unprotected by fortresses; and these being battered by an incessant discharge of artillery, soon gave way on all quarters. Still, however, what posterity may perhaps regard as incredible, the Caneans held out three years against all the forces of the Ottoman empire. At last they were going to capitulate, when the hope of assistance from France reanimated their valour, and rendered them invincible. The expected succours arrived on the 26th of June 1669. They were conducted by the duke of Noailles. Under his command were a great number of French noblemen, who came to make trial of their skill in arms against the Turks.

Next day after their arrival, the ardour of the French prompted them to make a general sally. The duke of Beaufort, admiral of France, assumed the command of the forlorn hope. He was the first to advance against the Mussulmans, and was followed by a numerous body of infantry and cavalry. They advanced furiously upon the enemy, attacked them within their trenches, forced the trenches, and would have compelled them to abandon their lines and artillery, had not an unforeseen accident damped their courage. In the midst of the engagement a magazine of powder was set on fire; the foremost of the combatants lost their lives; the French ranks were broken; several of their leaders, among whom was the duke of Beaufort, disappeared for ever; the soldiers fled in disorder; and the duke of Noailles, with difficulty, effected a retreat within the walls of Candia. The French accused the Italians of having betrayed them; and on that pretext prepared to set off sooner than the time agreed upon. No intreaties of the commandant could prevail with them to delay their departure; so they reembarked. Their departure determined the fate of the city. There were now no more than five hundred men to defend it. Morosini capitulated with Kiopruli, to whom he surrendered the kingdom of Crete, excepting only the Sude, Grabusa, and Spina-Longua. The grand visir made his entrance into Candia on the 4th of October 1670; and stayed eight months in that city, inspecting the reparation of its walls and fortresses.

The three fortresses left in the hands of the Venetians

M

Candia.

tians by the treaty of capitulation remained long after in their possession. At last they were all taken, one after another. In short, after a war of thirty years continuance, in the course of which more than two hundred thousand men fell in the island, and it was deluged with streams of Christian and Mahometan blood, Candia was entirely subdued by the Turks, in whose hands it still continues.

Of the climate of Candia travellers speak with rapture. The heat is never excessive; and in the plains violent cold is never felt. In the warmest days of summer the atmosphere is cooled by breezes from the sea. Winter properly begins here with December and ends with January; and during that short period snow never falls on the the lower grounds, and the surface of the water is rarely frozen over. Most frequently the weather is as fine then as it is in Britain at the beginning of June. These two months have received the name of *winter*, because in them there is a copious fall of rain, the sky is obscured with clouds, and the north winds blow violently; but the rains are favourable to agriculture, the winds chase the clouds towards the summits of the mountains, where a repository is formed for those waters which are to fertilize the fields; and the inhabitants of the plain suffer no inconvenience from these transient blasts. In the month of February, the ground is overspread with flowers and rising crops. The rest of the year is almost one continued fine day. The inhabitants of Crete never experience any of those mortifying returns of piercing cold, which are so frequently felt in Britain and even more southern countries; and which, succeeding suddenly after the cherishing heats of spring, nip the blossoming flowers, wither the open buds, destroy half the fruits of the year, and are fatal to delicate constitutions. The sky is always unclouded and serene; the winds are mild and refreshing breezes. The radiant sun proceeds in smiling majesty along the azure vault, and ripens the fruits on the lofty mountains, the rising hills, and the plains. The nights are no less beautiful; their coolness is delicious. The atmosphere not being overloaded with vapours, the sky unfolds to the observer's view a countless profusion of stars; those numerous stars sparkle with the most vivid rays, and strew the azure vault in which they appear fixed, with gold, with diamonds, and with rubies. Nothing can be more magnificent than this sight, and the Cretans enjoy it for six months in the year.

To the charms of the climate other advantages are joined which augment their value: There are scarce any morasses in the island; the waters never stand here in a state of stagnation; they flow in numberless streams from the tops of the mountains, and form here and there large fountains or small rivers that empty themselves into the sea; the elevated situation of their springs causes them to dash down with such rapidity, that they never lose themselves in pools or lakes; consequently insects cannot deposit their eggs upon them, as they would be immediately hurried down into the sea; and Crete is not infested like Egypt with those clouds of insects which swarm in the houses, and whose sting is insufferably painful; nor is the atmosphere here loaded with those noxious vapours which rise from marshy grounds.

The mountains and hills are overspread with various

kinds of thyme, savoury, wild thyme, and with a multitude of odoriferous and balsamic plants; the rivulets which flow down the vallies are overhung with myrtles and laurel roses; clumps of orange, citron, and almond trees, are plentifully scattered over the fields; the gardens are adorned with tufts of Arabian jasmine. In spring, they are bestrewed with beds of violets; some extensive plains are arrayed in saffron; the cavities of the rocks are fringed with sweet smelling dittany. In a word, from the hills, the vales, and the plains, on all hands, there arise clouds of exquisite perfumes, which embalm the air, and render it a luxury to breathe it.

As to the inhabitants, the Mahometan men are generally from five feet and an half to six feet tall. They bear a strong resemblance to ancient statues; and it must have been after such models that the ancient artists wrought. The women also are generally beautiful. Their dress does not restrain the growth of any part of their bodies, and their shape therefore assumes those admirable proportions with which the hand of the Creator has graced his fairest workmanship on earth. They are not all handsome or charming; but some of them are beautiful, particularly the Turkish ladies. In general, the Cretan women have a rising throat, a neck gracefully rounded, black eyes sparkling with animation, a small mouth, a fine nose, and cheeks delicately coloured with the fresh vermilion of health. But the oval of their form is different from that of Europeans, and the character of their beauty is peculiar to their own nation.

The quadrupeds belonging to the island are not of a ferocious temper. There are no lions, tigers, bears, wolves, foxes, nor indeed any dangerous animal here. Wild goats are the only inhabitants of the forests that overspread the lofty mountains; and these have nothing to fear but the ball of the hunter; hares inhabit the hills and the plain; sheep graze in security on the thyme and the heath; they are folded every night, and the shepherd sleeps soundly without being disturbed with the fear that wild animals may invade and ravage his folds.

The Cretans are very happy in not being exposed to the troublesome bite of noxious insects, the poison of serpents, and the rapacity of the wild beasts of the desert. The ancients believed that the island enjoyed these singular advantages, on account of its having been the birth-place of Jupiter. "The Cretans (say *Ælian*) celebrate in their songs the beneficence of Jupiter, and the favour which he conferred on their island, which was the place of his birth and education, by freeing it from every noxious animal, and even rendering it unfit for nourishing those noxious animals that are introduced into it from foreign countries."

Dittany holds the first rank among the medicinal plants which are produced in Crete. The praises bestowed on the virtues of this plant by the ancients are altogether extravagant; yet we perhaps treat the medicinal virtues of this plant with too much contempt. Its leaf is very balsamic, and its flower diffuses around it a delicious odour. At present the inhabitants of the island apply it with success on various occasions. The leaf, when dried and taken in an infusion with a little sugar, makes a very pleasant drink, of a finer flavour than tea. It is there an immediate cure for a weak

Candia.

Candia weak stomach, and enables it to recover its tone after a bad digestion.

Diseases are very rare in a country whose atmosphere is exceedingly pure; and in Candia, epidemical diseases are unknown. Fevers prevail here in summer, but are not dangerous; and the plague would be wholly unknown, had not the Turks destroyed the lazarets that were established by the Venetians, for strangers to do quarantine in. Since the period when these were demolished, it is occasionally introduced by ships from Smyrna and Constantinople. As no precautions are taken against it, it gains ground, and spreads over the island from one province to another; and as the colds and heats are never intemperate, it sometimes continues its ravages for six months at a time.

This fine country is infested with a disease somewhat less dangerous than the plague, but whose symptoms are somewhat more hideous; that disease is the leprosy. In ancient times, Syria was the focus in which it raged with most fury: and from Syria it was carried into several of the islands of the Archipelago. It is infectious, and is instantaneously communicated by contact. The victims who are attacked by it, are driven from society, and confined to little ruinous houses on the highway. They are strictly forbidden to leave these miserable dwellings, or hold intercourse with any person. Those poor wretches have generally beside their huts a small garden producing pulse, and feeding poultry; and with that support, and what they obtain from passengers, they find means to drag out a painful life in circumstances of shocking bodily distress. Their bloated skin is covered with a scaly crust, speckled with red and white spots; which afflict them with intolerable itchings. A hoarse and tremulous voice issues from the bottom of their breasts. Their words are scarce articulated; because their distemper inwardly preys upon the organs of speech. These frightful spectres gradually lose the use of their limbs. They continue to breathe till such time as the whole mass of their blood is corrupted, and their bodies entirely in a state of putrefaction. The rich are not attacked by this distemper: it confines itself to the poor, chiefly to the Greeks. But those Greeks observe strictly their four lents; and eat nothing during that time but salt fish, botorgo, salted and smoked pickled olives, and cheese. They drink plentifully of the hot and muddy wines of the island. The natural tendency of such a regimen must be, to fire the blood, to thicken the fluid part of it, and thus at length to bring on a leprosy.

Candia is at present governed by three Pachas, who reside respectively at Candia, Canea, and Retimo. The first, who is always a Pacha of three tails, may be considered as viceroy of the island. He enjoys more extensive powers than the others. To him the inspection of the forts and arsenals is entrusted. He nominates to such military employments as fall vacant, as well as to the governments of the Sude, Grabusa, Spina Longua, and Gira-petra. The governors of these forts are denominated Beys. Each of them has a constable and three general officers under him: one of whom is commander of the artillery; another of the cavalry; and the third of the janissaries.

The council of the pacha consists of a kyaia, who is the channel through which all orders are issued, and

all favours bestowed; an aga of the janissaries, colonel-general of the troops, who has the chief care of the regulation of the police; two topigi bachi; a defterdar, who is treasurer-general for the imperial revenues; a keeper of the imperial treasury; and the chief officers of the army. This government is entirely military, and the power of the pacha serasquier is absolute. The justice of his sentences is never called into question; they are instantly carried into execution.

The people of the law are the musti, who is the religious head, and the cadi. The first interprets those laws which regard the division of the patrimony among the children of a family, successions, and marriages;—in a word, all that are contained in the Koran; and he also decides on every thing that relates to the ceremonies of the Mussulman religion. The cadi cannot pronounce sentence on affairs connected with these laws, without first taking the opinion of the musti in writing, which is named *Faifsa*. It is his business to receive the declarations, complaints, and donations of private persons; and to decide on such differences as arise among them. The pacha is obliged to consult those judges when he puts a Turk legally to death; but the pacha, who is dignified with three tails, sets himself above all laws, condemns to death, and sees his sentence executed, of his own proper authority. All the mosques have their Itam, a kind of curate, whose duty is to perform the service. There are schoolmasters in the different quarters of the city. These persons are much respected in Turkey, and are honoured with the title of Effendi.

The garrison of Candia consists of forty-six companies, composing a military force of about ten thousand men. All these forces do not reside constantly in the city, but they may be mustered in a very short time. They are all regularly paid every three months, excepting the janissaries, none of whom but the officers receive pay. The different gradations of this military body do not depend on the pacha. The council of each company, consisting of veterans, and of officers in actual service, has the power of naming to them. A person can occupy the same post for no longer than two years; but the post of *Sorbagi*, or captain, which is purchased at Constantinople, is held for life. The *ousta*, or cook, is also continued in his employment as long as the company to which he belongs is satisfied with him. Each company has its almoner, denominated *imam*.

The garrisons of Canea and Retimo, formed on a similar plan, are much less numerous. The first consists of about three thousand men, the other of five hundred; but as all the male children of the Turks are enrolled among the janissaries as soon as born, the number of these troops might be greatly augmented in time of war; but, to say the truth, they are far from formidable. Most of them have never seen fire, nor are they ever exercised in military evolutions.

The pachas of Canea and Retimo are no less absolute, within the bounds of their respective provinces, than the pacha of Candia. They enjoy the same privileges with him, and their council consists of the same officers. These governors chief object is to get rich as speedily as possible; and in order to accomplish that end, they practise all the arts and cruelties of oppression, to squeeze money from the Greeks. In truth,

M 2 those

Candia.

Candia.

those poor wretches run to meet the chains with which they are loaded. Envy, which always preys upon them, continually prompts them to take up arms. If some one among them happen to enjoy a decent fortune, the rest assiduously seek some pretence for accusing him before the pacha, who takes advantage of these dissensions, to seize the property of both the parties. It is by no means astonishing, that under so barbarous a government, the number of the Greeks is daily diminished. There are scarcely

150,000 Greeks
in the island, sixty-five thousand of whom pay the carach.

The Turks have not possessed the island for more than one hundred and twenty years; yet, as they are not exposed to the same oppression, they have multiplied in it, and raised themselves upon the ruin of the ancient inhabitants. Their number amounts to

200,000 Turks.
The Jews, of whom there are not many in the island, amount only to

200.
Total is 350,200 souls.

This fertile country is in want of nothing but industrious husbandmen, secure of enjoying the fruit of their labours. It might maintain four times its present number of inhabitants.

Antiquity has celebrated the island of Crete as containing an hundred populous cities; and the industry of geographers has preserved their names and situations. Many of these cities contained no fewer than thirty thousand inhabitants;—and by reckoning them, on an average, at six thousand each, we shall in all probability be rather within than beyond the truth. This calculation gives for an hundred cities

600,000
By allowing the same number as inhabitants of the towns, villages, and all the rest of the island, 600,000

the whole number of the inhabitants of ancient Crete will amount to

1,200,000
This number cannot be exaggerated. When Candia was in the hands of the Venetians, it was reckoned to contain nine hundred fourscore and sixteen villages.

It appears, therefore, that when the island of Crete enjoyed the blessing of liberty, it maintained to the number of eight hundred and forty-nine thousand eight hundred more inhabitants than it does at present. But since those happier times, she has been deprived of her laws by the tyranny of the Romans; has groaned under the destructive sway of the monarchs of the lower empire; has been exposed for a period of an hundred and twenty years to the ravages of the Arabians; has next passed under the dominion of the Venetians; and has at last been subjected to the despotism of the Turks, who have produced a dreadful depopulation in all the countries which have been subdued by their arms.

The Turks allow the Greeks the free exercise of their religion, but forbid them to repair their churches or monasteries; and accordingly they cannot obtain permission to repair their places of worship, or religious houses, but by the powerful influence of gold. From this article the pachas derive very considerable sums.

They have twelve bishops as formerly, the first of whom assumes the title of Archbishop of Gortynia. He resides at Candia; in which city the metropolitan church of the island stands. He is appointed by the patriarch of Constantinople; and has the right of nominating to all the other bishoprics of the island; the names of which are, Gortynia, Cnossou, Mirabella, Hyera, Gira-petra, Arcadia, Cherronefe, Lambis, Milopotamo, Retimo, Canea, Cifamo. These bishoprics are nearly the same as under the reign of the Greek emperors. The patriarch wears a triple tiara, writes his signature in red ink, and answers for all the debts of the clergy. To enable him to fulfil his engagements, he lays impositions on the rest of the bishops, and particularly on the monasteries, from which he draws very handsome contributions. He is considered as the head of the Greeks, whom he protects, as far as his slender credit goes. The orders of government are directed to him on important occasions; and he is the only one of all the Greeks in the island who enjoys the privilege of entering the city on horseback.

CANDIA, is the capital of the above island, situated on its northern coast, in E. Long. 25. 0. N. Lat. 35. 30. It stands on the same situation which was formerly occupied by Heraclea, and is the seat of government under the Turks. Its walls, which are more than a league in compass, are in good repair, and defended by deep ditches, but not protected by any exterior fort. Towards the sea, it has no attacks to fear; because the shallowness of the harbour renders it inaccessible to ships of war.

The Porte generally commits the government of this island to a Pacha of three tails. The principal officers, and several bodies of the Ottoman soldiery, are stationed here. This city, when under the Venetians, was opulent, commercial, and populous; but it has now lost much of its former strength and grandeur. The harbour, naturally a fine basin, in which ships are securely sheltered from every storm, is every day becoming narrower and shallower. At present it admits only boats, and small ships after they have discharged a part of their freight. Those vessels, which the Turks freight at Candia, are obliged to go almost empty to the ports of Standie, whither their cargoes are conveyed to them in barks. Such inconveniences are highly unfavourable to commerce; and as government never thinks of removing them, the trade of Candia is therefore considerably decayed.

Candia, which was embellished by the Venetians with regular streets, handsome houses, a fine square, and a magnificent cistern, contains at present but a small number of inhabitants, notwithstanding the vast extent of the area inclosed within its walls. Several divisions of the city are void of inhabitants. That in which the market-place stands is the only one which discovers any stir of business, or show of affluence. The Mahometans have converted most of the Christian temples into mosques; yet they have left two churches to the Greeks, one to the Armenians, and a synagogue to the Jews. The Capuchins possess a small convent, with a chapel in which the vice-consul of France hears mass. At present he is the only Frenchman who attends it, as the French merchants have taken up their residence at Canea.

West of the city of Candia is an extensive range of hills;

Candia.

Candiac
||
Candidati.

hills, which are a continuation of mount Ida, and of which the extremity forms the promontory of Dion. On the way to Dion, we find Palio Castro, on the shore; a name which the modern Greeks give indifferently to all remains of ancient cities. Its situation corresponds to that of the ancient Panormus, which stood north-west from Haraclea.

The river which runs west of Candia was anciently known by the name of Triton; near the source of which Minerva sprung from the brain of Jove. Loaxus is a little farther distant. About a league east of that city, the river Ceratus flows through a delightful vale. According to Strabo, in one part of its course it runs near by Gnoſſus. A little beyond that, is another river supposed to be Therenus, on the banks of which, fable relates that Jupiter consummated his marriage with Juno. For the space of more than half a league round the walls of Candia there is not a single tree to be seen. The Turks cut them all down in the time of the siege, and laid waste the gardens and orchards. Beyond that extent, the country is plentifully covered with corn and fruit trees. The neighbouring hills are overspread with vineyards, which produce the malmsey of mount Ida,—worthy of preference at the table of the most exquisite connoisseur in wines. That species of wine, though little known, has a fine flavour, a very pleasant relish, and is highly esteemed in the island.

CANDIAC (John Lewis), a premature genius, born at Candiac in the diocese of Nismes in France, in 1719. In the cradle he distinguished his letters: at 13 months, he knew them perfectly: at three years of age, he read Latin, either printed or in manuscript: at four, he translated from that tongue: at six, he read Greek and Hebrew; was master of the principles of arithmetic, history, geography, heraldry, and the science of medals; and had read the best authors on almost every branch of literature. He died of a complication of disorders, at Paris, in 1726.

CANDIDATE, a person who aspires to some public office.

In the Roman commonwealth, they were obliged to wear a white gown during the two years of their soliciting a place. This garment, according to Plutarch, they wore without any other clothes, that the people might not suspect they concealed money for purchasing votes, and also that they might more easily show to the people the scars of those wounds they had received in fighting for the defence of the commonwealth. The candidates usually declared their pretensions a year before the time of election, which they spent in making interest and gaining friends. Various arts of popularity were practised for this purpose, and frequent circuits made round the city, and visits and compliments to all sorts of persons, the process of which was called *ambitus*. See *AMBITUS*.

CANDIDATI MILITES, an order of soldiers, among the Romans, who served as the emperor's bodyguards to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called *candidati*, because clothed in white, either that they might be more conspicuous, or because they were considered in the way of preferment.

CANDISH, a considerable province of Asia, in the

dominions of the Great Mogul, bounded by Chytor and Malva on the north, Orixia on the east, Decan on the south, and Guzarat on the west. It is populous and rich; and abounds in cotton, rice, and indigo. Brampore is the capital town.

CANDLE, a small taper of tallow, wax, or spermaceti; the wick of which is commonly of several threads of cotton, spun and twisted together.

A tallow-candle, to be good, must be half sheep's and half bullock's tallow; for hog's tallow makes the candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an inconstant vibratory flame, which is both prejudicial to the eyes and insufficient for the distinct illumination of objects.

There are two sorts of tallow-candles; the one dipped, the other moulded: the former are the common candles; the others are the invention of the sieur le Brege at Paris.

As to the method of making candles in general: After the tallow has been weighed, and mixed in the due proportions, it is cut into very small pieces, that it may melt the sooner; for the tallow in lumps, as it comes from the butchers, would be in danger of burning or turning black, if it were left too long over the fire. Being perfectly melted and skimmed, they pour a certain quantity of water into it, proportionable to the quantity of tallow. This serves to precipitate to the bottom of the vessel the impurities of the tallow which may have escaped the skimmer. No water, however, must be thrown into the tallow designed for the three first dips; because the wick, being still quite dry, would imbibe the water, which makes the candles crackle in burning, and renders them of bad use. The tallow, thus melted, is poured into a tub, through a coarse sieve of horse-hair, to purify it still more, and may be used after having stood three hours. It will continue fit for use 24 hours in summer and 15 in winter. The wicks are made of spun cotton, which the tallow-chandlers buy in skains, and which they wind up into bottoms or clues. Whence they are cut out, with an instrument contrived on purpose, into pieces of the length of the candle required; then put on the sticks or broaches, or else placed in the moulds, as the candles are intended to be either dipped or moulded.

Wax-candles are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these, there are several kinds: some of a conical figure, used to illuminate churches, and in processions, funeral ceremonies, &c. (see *TAPER*); others of a cylindrical form, used on ordinary occasions. The first are either made with a ladle or the hand. 1. To make wax-candles with the ladle. The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended over a large basin of copper tinned, and full of melted wax: a large ladle full of this wax is poured gently on the tops of the wicks one after another, and this operation continued till the candle arrive at its destined bigness; with this precaution, that the three first ladles be poured on at the top of the wick, the fourth at the height of $\frac{1}{4}$, the fifth at $\frac{1}{2}$, and the sixth at $\frac{3}{4}$, in order to give the candle its pyramidal form. Then the candles are taken down, kept warm,

and

Candle

and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom. 2. As to the manner of making wax-candles by the hand, they begin to soften the wax, by working it several times in hot water, contained in a narrow but deep caldron. A piece of the wax is then taken out, and disposed by little and little around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing still as they descend towards the neck. In other respects the method is nearly the same as in the former case. However, it must be observed, that, in the former case, water is always used to moisten the several instruments, to prevent the wax from sticking; and in the latter, oil of olives, or lard, for the hands, &c. The cylindrical wax-candles are either made as the former, with a ladle, or drawn. Wax-candles drawn, are so called, because actually drawn in the manner of wire, by means of two large rollers of wood, turned by a handle, which, turning backwards and forwards several times, pass the wick through melted wax contained in a brass basin, and at the same time through the holes of an instrument like that used for drawing wire fastened at one side of the basin.

If any chandlers mix with their wares any thing deceitfully, &c. the candles shall be forfeited. Stat. 23 Eliz. and a tax or duty is granted on candles, by 8 and 9 Anne, cap. 6. made for sale, of one penny a pound, besides the duty upon tallow, by 8 Anne, cap. 9. And by 24 Geo. III. cap. 11. an additional duty of an halfpenny a pound: and by the same an additional duty of an halfpenny a pound is laid upon all candles imported (except those of wax and spermaceti, for which see *Wax-Candles*), subject also to the two additional 5 per cents. imposed by 19 and 22 Geo. III. besides the duty of 2½d. formerly imposed by 2 W. sess. 2. cap. 4. 8 Anne, cap. 9. and 9 Anne, cap. 6. And every maker of candles, other than wax candles, for sale, shall annually take out a licence at L. 1. The maker of candles shall, in four weeks within the bills, and elsewhere in six weeks, after entry, clear off the duties on pain of double duty: nor sell any after default in payment on pain of double value; 8 Anne, cap. 9. The makers of candles are not to use melting houses, without making a true entry, on pain of L. 100, and to give notice of making candles to the excise officer for the duties; and of the number, &c. or shall forfeit L. 50, stat. 11. Geo. I. cap. 30. See also 23 Geo. II. cap. 21. and 26 Geo. II. cap. 32. No maker of candles for sale shall begin to make candles, without notice first given to the officer, unless from September 29th to March 25th yearly, between seven in the morning and five in the evening, and from March 25th to September 29th, between five in the morning and seven in the evening, on pain of L. 10, 10 Anne, cap. 26. The penalty of obstructing the officer is L. 20, and of removing candles before they are surveyed L. 20, 8 Anne, cap. 9. The penalty of privately making candles is the forfeiture of the same and utensils, and L. 100, 5 Geo. III. cap. 43. And the penalty of mingling weighed with unweighed candles, of removing them before they are weighed, or of concealing them, is the forfeiture of L. 100, 11 Geo. cap. 30. Candles, for which the duty hath been paid, may be exported, and the duty drawn back; but

no draw-back shall be allowed on the exportation of any foreign candles imported. 8 Ann. cap. 9. 23 Geo. II. cap. 21.

The Roman candles were at first little strings dipt in pitch, or surrounded with wax; though afterwards they made them of the papyrus, covered likewise with wax; and sometimes also of rushes, by stripping off the outer rind, and only retaining the pith.—For religious offices, wax candles were used; for vulgar uses, those of tallow. Lord Bacon proposes candles of divers compositions and ingredients, as also of different sorts of wicks; with experiments of the degrees of duration, and light of each. Good housewives bury their candles in flour or bran, which it is said increases their lasting almost half.

Experiments to determine the real and comparative value of burning CANDLES of different sorts and sizes.

N. B. The time that one candle lasted was taken from an average of several trials in each size.

It is observable, in optics, that the flame of two candles joined, give a much stronger light than both of them separate. The observation was suggested by Dr Franklin. Probably the union of the two flames produces a greater degree of heat, whereby the vapour is attenuated, and the particles of which light consists more copiously emitted.

Lighting a CANDLE by a small spark of electricity. This method, which is an invention of Dr Ingenhoufz, is recorded in the Phil. Trans. vol. 68. It is done by a small phial, having eight or ten inches of metallic coating, or even less, charged with electricity, which may be done at any time of the night by a person who has an electric machine in his room. "When I have occasion to light a candle," says he, "I charge a small coated phial, whose knob is bent outwards, so as to hang a little over the body of the phial; then I wrap some loose cotton over the extremity of a long brass pin or a wire, so as to stick moderately fast to its substance. I next roll this extremity of the pin wrapped up with cotton in some fine powder of resin, (which I always keep in readiness upon the table for this purpose, either in a wide-mouthed phial or in a loose

Candle

Candle,
Candle-
berry.

loose paper); this being done, I apply the extremity of the pin or wire to the external coating of the charged phial, and bring as quickly as possible the other extremity wrapped round with cotton to the knob: the powder of resin takes fire, and communicates its flame to the cotton, and both together burn long enough to light a candle. As I do not want more than half a minute to light my candle in this way, I find it a readier method than kindling it by a flint and steel, or calling a servant. I have found, that powder of white or yellow resin lights easier than that of brown. The *farina lycopodii* may be used for the same purpose: but it is not so good as the powder of resin, because it does not take fire quite so readily, requiring a stronger spark not to miss: besides, it is soon burnt away. By dipping the cotton in oil of turpentine, the same effect may be as readily obtained, if you take a jar somewhat greater in size. This oil will inflame so much the readier if you strew a few fine particles of brasa upon it. The pin dust is the best for this purpose; but as this oil is scattered about by the explosion, and when kindled fills the room with much more smoke than the powder of resin, I prefer the last."

CANDLE-Bombs, a name given to small glass bubbles, having a neck about an inch long, with a very slender bore, by means of which a small quantity of water is introduced into them, and the orifice afterwards closed up. This stalk being put through the wick of a burning candle, the vicinity of the flame soon rarifies the water into steam, by the elasticity of which the glass is broken with a loud crack.

CANDLE is also a term of medicine, and is reckoned among the instruments of surgery. Thus the *candela fumalis*, or the *candela pro fuffitu odorata*, is a mass of an oblong form, consisting of odoriferous powders, mixed up with a third or more of the charcoal of willow or lime tree, and reduced to a proper consistence with a mucilage of gum tragacanth, labdanum, or turpentine. It is intended to excite a grateful smell without any flame; to correct the air, to fortify the brain, and to excite the spirits.

Medicated CANDLE, the same with **BOUGIE**.

CANDLE. Sale or auction by inch of candle, is when a small piece of candle, being lighted, the bystanders are allowed to bid for the merchandize that is selling; but the moment the candle is out, the commodity is adjudged to the last bidder.

There is also an excommunication by inch of candle; when the sinner is allowed to come to repentance while a candle continues burning; but after it is consumed, he remains excommunicated to all intents and purposes.

Rush-CANDLES, used in different parts of England, are made of the pith of a sort of rushes, peeled or stripped of the skin, except on one side, and dipped in melted grease.

CANDLER-Wood, slips of pine about the thickness of a finger, used in New England and other colonies to burn instead of candles, giving a very good light. The French inhabitants of Tortuga use slips of yellow fantal-wood for the same purpose, and under the same denomination, which yields a clear flame though of a green colour.

CANDLEBERRY TREE, in botany, the English name of the **MYRICA**.

CANDLEMAS, a feast of the church held on the second day of February, in honour of the purification of the Virgin Mary. It is borrowed from the practice of the ancient Christians, who on that day used abundance of lights both in their churches and processions, in memory, as is supposed, of our Saviour's being on that day declared by Simon "to be a light to lighten the Gentiles." In imitation of this custom, the Roman-catholics on this day consecrate all the tapers and candles which they use in their churches during the whole year. At Rome, the Pope performs that ceremony himself; and distributes wax-candles to the cardinals and others, who carry them in procession through the great hall of the Pope's palace. This ceremony was prohibited in England by an order of council in 1548.

CANDLEMAS, (2d Feb.) is made one of the four terms of the year for paying and receiving rents or borrowed money, &c.—In the courts of law, Candlemas terms begin 15th January, and ends 3d February.

CANDLESTICK, an instrument to hold a candle, made in different forms, and of all sorts of matter.

The golden candlestick was one of the sacred utensils made by Moses to be placed in the Jewish tabernacle. It was made of hammered gold, a talent in weight. It consisted of seven branches supported by a base or foot. These branches were adorned at equal distances with six flowers like lilies, and with as many bowls and knobs placed alternately. Upon the stock and six branches of the candlestick were the golden lamps, which were immoveable, wherein were put oil and cotton.

These seven lamps were lighted every evening, and extinguished every morning. The lamps had their tongs or snuffers to draw the cotton in or out, and dishes underneath them to receive the sparks or droppings of the oil. This candlestick was placed in the antichamber of the sanctuary on the south side, and served to illuminate the altar of perfume and the tabernacle of the shew-bread. When Solomon had built the temple of the Lord, he placed in it ten golden candlesticks of the same form as that described by Moses, five on the north and five on the south side of the holy place: But after the Babylonish captivity, the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. This sacred utensil, upon the destruction of the temple by the Romans, was lodged in the temple of peace built by Vespasian; and the representation of it is still to be seen on the triumphal arch at the foot of mount Palatine, on which Vespasian's triumph is delineated.

CANDY, a large kingdom of Asia, in the island of Ceylon. It contains about a quarter of the island; and as it is encompassed with high mountains, and covered with thick forests, through which the roads and paths are narrow and difficult, the king has them guarded to prevent his subjects from going into other countries. It is full of hills, from whence rivulets proceed which are full of fish; but as they run among the rocks, they are not fit for boats: however, the inhabitants are very dexterous in turning them to water their land, which is fruitful in rice, pulse, and hemp. The king is absolute, and his subjects are idolaters. The capital town is of the same name.

CANDY, a town of Asia, and capital of a kingdom of

Candlemas
||
Candy.

Candy
||
Canea.

of the same name, in the island of Ceylon. It has been often burnt by the Portuguese, when they were masters of these coasts. The houses are very poor, low, and badly furnished. E. Long. 79. 12. N. Lat. 7. 35.

CANDY, or *Sugar-Candy*, a preparation of sugar made by melting and crystallizing it six or seven times over, to render it hard or transparent. It is of three kinds, white, yellow, and red. The white comes from the loaf-sugar, the yellow from the cassonado, and the red from the muscavado.

CANDYING, the act of preserving simples in substance, by boiling them in sugar. The performance of this originally belonged to the apothecaries, but is now become a part of the business of the confectioner.

CANE, in botany. See *ARUNDO* and *CALAMUS*.

CANE, denotes also a walking stick. It is customary to adorn it with a head of gold, silver, agate, &c. Some are without knots, and very smooth and even; others are full of knots abouts two inches distance from one another. These last have very little elasticity, and will not bend so well as the others.

Canes of Bengal are the most beautiful which the Europeans bring into Europe. Some of them are so fine, that people work them into bowls or vessels, which being varnished over in the inside, with black or yellow lacca, will hold liquors as well as glass or China ware does; and the Indians use them for that purpose.

CANE is also the name of a long measure, which differs according to the several countries where it is used. At Naples the cane is equal to 7 feet $3\frac{1}{2}$ inches English measure: the cane of Tholouse and the Upper Languedoc, is equal to the varre of Arragon, and contains five feet $8\frac{1}{2}$ inches; at Montpellier, Provence, Dauphine, and the Lower Languedoc, to six English feet $5\frac{1}{2}$ inches.

CANEA, a considerable town of the island of Candia, where a bashaw resides. It was built by the Venetians, and occupies part of the site of the ancient *CYDONIA*. It is but about two miles in compass; encircled on the land side with a single wall, extremely thick; and defended by a broad and deep ditch, cut through a bed of rock, which extends all around the wall. By cutting it still deeper, they might cause the sea to flow round its ramparts; on which they have raised high platforms, that their great guns might command a wider extent of the adjacent plain. The city has only one gate, the gate of Retimo, protected by an half-moon battery, which is the only exterior fort. The side which faces the sea is the best fortified. On the left of the harbour are four batteries, rising one above another, and planted with a number of large cannons of cast metal, marked with the arms of Venice. The first of these batteries stands close on the brink of the sea. The right side of the harbour is defended only by a strong wall, extending along a chain of pointed rocks which it is dangerous for ships to approach. At the extremity of this wall, there is an old castle, falling into ruins. Beneath that castle, the Venetians had immense arsenals, vaulted with stone. Each of these vaults was of sufficient length, breadth, and height, to serve as a work-shop for building a ship of the line. The ground is sloping, and the outermost part of these capacious arsenals is on a level with the sea; so that it

Nº 63.

was very easy to launch the ships built there into the water. The Turks are suffering that magnificent work to fall into ruins.

The city of Canea is laid out on a fine plan. The streets are large and straight; and the squares adorned with fountains. There are no remarkable buildings in it. Most of the houses are flat-roofed, and have only one story. Those contiguous to the harbour are adorned with galleries, from which you enjoy a delightful prospect. From the windows you discover the large bay formed between Cape Spada and Cape Melec, and all the ships that are entering in or passing out. The harbour, at present, receives ships of 200 tons burden; and it might be enlarged so as to admit the largest frigates. Its mouth is exposed to the violence of the north winds, which sometimes swell the billows above the ramparts. But, as it is narrow, and the bottom is good, ships that are well moored run no danger. At the time when Tournefort visited Crete, Canea did not contain more than five or six thousand inhabitants. But, at present, when the gates of Gira-Petra, Candia, and Retimo are choaked up, the merchants have retired to Canea; and it is reckoned to contain 16,000 souls. The environs of the town are admirable; being adorned with forests of olive-trees mixed with fields, vineyards, gardens, and brooks bordered with myrtle-trees and laurel-roses. The chief revenue of this town consists in oil-olive. E. Long. 24. 15. N. Lat. 35. 28.

CANELLA, in botany: A genus of the monogynia order belonging to the dodecandria class of plants; and in the natural method ranking under the 12th order, *Holoracea*. The calyx is three lobed; the petals are five; the antheræ 16, growing to an urceolated or bladder-shaped nectarium; and the fruit is a trilocular berry, with two seeds. There is but one species, the alba; which grows usually about 20 feet high, and eight or ten inches in thickness, in the thick woods of most of the Bahama islands. The leaves are narrow at the stalk, growing wider at their ends, which are broad and rounding, having a middle rib only; they are very smooth, and of a light shining green. In May and June the flowers, which are pentapetalous, come forth in clusters at the ends of the branches: they are red, and very fragrant, and are succeeded by round berries, of the size of large peas, green, and when ripe (which is in February) purple, containing two shining black seeds, flat on one side, otherwise not unlike in shape to a kidney bean: these seeds in the berry are enveloped in a slimy mucilage. The whole plant is very aromatic, the bark particularly, being more used in distilling, and in greater esteem, in the more northern parts of the world than in Britain.

The bark is the canella alba of the shops. It is brought to us rolled up into long quills, thicker than cinnamon, and both outwardly and inwardly of a whitish colour, lightly inclining to yellow. Infusions of it in water are of a yellowish colour, and smell of the canella; but they are rather bitter than aromatic. Tinctures in rectified spirit have the warmth of the bark, but little of its smell. Proof-spirit dissolves the aromatic as well as the bitter matter of the canella, and is therefore the best menstruum.

The canella is the interior bark freed from an outward thin

Pl. CXVI.

Cancerma-cochlearia.

Cassida.

Cantharis, diff. spec.

Canelle
||
Canes.

thin rough one, and dried in the shade. The shops distinguish two sorts of canella, differing from each other in the length and thickness of the quills: they are both the bark of the same tree; the thicker being taken from the trunk, and the thinner from the branches. This bark is a warm pungent aromatic, though not of the most agreeable kind: nor are any of the preparations of it very grateful.

Canella alba is often employed where a warm stimulant to the stomach is necessary, and as a corrigent of other articles. It is now, however, little used in composition by the London college; the only official formula which it enters being the pulvis aloeticus: but with the Edinburgh college it is an ingredient in the tinctura amara, vinum amatum, vinum rhei, &c. It is useful as covering the taste of some other articles.— This bark has been confounded with that called Winter's bark, which belongs to a very different tree. See WINTERA.

CANELLE, or CANE-LAND, a large country in the island of Ceylon, called formerly the *kingdom of Cota*. It contains a great number of cantons, the principal of which are occupied by the Dutch. The chief riches of this country consist in cinnamon, of which there are large forests. There are five towns on the coast, some forts, and a great number of harbours. The rest of the country is inhabited by the natives; and there are several rich mines, from whence they get rubies, sapphires, topazes, cats-eyes, and several other precious stones.

CANEPHORÆ, in Grecian antiquity, virgins who, when they became marriageable, presented certain baskets full of little curiosities to Diana, in order to get leave to depart out of her train, and change their state of life.

CANEPHORIA, in Grecian antiquity, a ceremony which made part of a feast, celebrated by the Athenian virgins on the eve of their marriage-day. At Athens the canephoria consisted in this; that the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of presents to engage the goddess to make the marriage-state happy; or, as the scholiast of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddess, the protectrix of virginity, for abandoning her party; or as a ceremony to appease her wrath. Suidas calls it a festival in honour of Diana.

CANEPHORIA, is also the name of a festival in honour of Bacchus, celebrated particularly by the Athenians, on which the young maids carried golden baskets full of fruit, which baskets were covered, to conceal the mystery from the uninitiated.

CANES, in Egypt and other eastern countries, a poor sort of buildings for the reception of strangers and travellers. People are accommodated in these with a room at a small price, but with no other necessities; so that, excepting the room, there are no greater accommodations in these houses than in the deserts, only that there is a market near.

CANES Venatici, in astronomy, the grey-hounds, two new constellations, first established by Hevelius, between the tail of the Great Bear and Bootes's arms, above the Coma Berenices. The first is called *asterion*, being that next the Bear's tail; the other *chara*. They

VOL. IV. Part. I.

comprehend 23 stars, of which Tycho only observed two. The longitudes and latitudes of each are given by Hevelius. In the British Catalogue they are 25.

CANETO, a strong town of Italy in the duchy of Mantua, seated on the river Oglio, which was taken by the Imperialists in 1701, by the French in 1702, afterwards by the Imperialists, and then by the French in 1705. E. Long. 10. 45. N. Lat. 40. 55.

CANGA, in the Chinese affairs, a wooden clog borne on the neck, by way of punishment for divers offences. The canga is composed of two pieces of wood notched, to receive the criminal's neck; the load lies on his shoulders, and is more or less heavy according to the quality of his offence. Some cangas weigh 200lb; the generality from 50 to 60. The Mandarins condemn to the punishment of the canga. Sentence of death is sometimes changed for this kind of punishment.

CANGE (Charles du Fresne sieur du), one of the most learned writers of his time, was born at Amiens in 1601, and studied at the Jesuits college in that city. Afterwards he applied himself to the study of the law at Orleans, and gained great reputation by his works; among which are, 1. The history of the empire of Constantinople under the French emperors. 2. John Cinnamus's six books of the history of the affairs of John and Manuel Comnenus, in Greek and Latin, with historical and philological notes. 3. *Glossarium ad Scriptores mediæ & infimæ Latinitatis*.

CANGI, CEANGI, or *Cangani*, anciently a people of Britain, concerning whose situation antiquaries have been much perplexed. They are all the same people. Camden discovered some traces of them in many different and distant places, as in Somersetshire, Wales, Derbyshire, and Cheshire; and he might have found as plain vestiges of them in Devonshire, Dorsetshire, Essex, Wiltshire, &c. Mr Horsley and others are no less perplexed and undetermined in their opinions on this subject. But Mr Baxter seems to have discovered the true cause of all this perplexity, by observing that the Cangi or Ceangi were not a distinct nation seated in one particular place, but such of the youth of many different nations as were employed in pasturage, in feeding the flocks and herds of their respective tribes. Almost all the ancient nations of Britain had their ceangi, their pastoritia pubes, the keepers of their flocks and herds, who ranged about the country in great numbers, as they were invited by the season and plenty of pasture for their cattle. This is the reason that vestiges of their name are to be found in so many different parts of Britain; but chiefly in those parts which are most fit for pasturage. These ceangi of the different British nations, naturally brave, and rendered still more hardy by their way of life, were constantly armed for the protection of their flocks from wild beasts; and these arms they occasionally employed in the defence of their country and their liberty.

CANGIAGIO, or CAMBIASI (Ludovico), one of the most eminent of the Genoese painters, was born in 1527. His works at Genoa are very numerous; and he was employed by the king of Spain to adorn part of the Escorial. It is remarked of him, that he was not only a most expeditious and rapid painter, but also that he worked equally well with both hands;

N

and

Caneto
||
Cangiagio.

Canicula
||
Canine.

and by that unusual power he executed more designs, and finished more grand works with his own pencil, in a much shorter time, than most other artists could do with several assistants. He died in 1585.

In the royal collection at Paris, there is a Sleeping Cupid, as large as life, and likewise Judith with her attendant; which are painted by Cangiagio, and are an honour to that master. And in the Pembroke collection at Wilton, is a picture, reputed the work of Cangiagio, representing Christ bearing his Cross.

CANICULA, is a name proper to one of the stars of the constellation *canis major*, called also simply the *dog-star*; by the Greeks *μειγις*, *Sirius* *. Canicula is the tenth in order in the Britannic catalogue; in Tycho's and Ptolemy's it is the second. It is situated in the mouth of the constellation; and is of the first magnitude, being the largest and brightest of all the stars in the heavens. From the rising of this star not cosmically, or with the sun, but heliacally, that is, its emergence from the sun's rays, which now happens about the 15th day of August, the ancients reckoned their *dies caniculares*, or dog-days. The Egyptians and Ethiopians began their year at the rising of the canicula, reckoning to its rise again the next year, which is called the *annus canarius*, or canicular year. This year consisted ordinarily of 365 days, and every fourth year of 366, by which it was accommodated to the civil year. The reason of their choice of the canicula before the other stars to compute their time by, was not only the superior brightness of that star, but because its heliacal rising was in Egypt a time of singular note, as falling on the greatest augmentation of the Nile, the reputed father of Egypt. Ephestion adds, that from the aspect and colour of canicula, the Egyptians drew prognostics concerning the rise of the Nile; and, according to Florus, predicted the future state of the year; so that the first rising of this star was annually observed with great attention.

CANICULUM, or CANICULUS, in the Byzantine antiquities, a golden standish or ink-vessel, decorated with precious stones, wherein was kept the sacred *encaustum*, or red ink, wherewith the emperors signed their decrees, letters, &c. The word is by some derived from *canis*, or *caniculus*; alluding to the figure of a dog which it represented, or rather because it was supported by the figures of dogs. The caniculum was under the care of a particular officer of state.

CANINA, the north part of the ancient Epirus, a province of Greece, which now belongs to the Turks, and lies off the entrance of the gulph of Venice. The principal town is of the same name, and is seated on the sea-coast, at the foot of the mountains of Chimera. E. Long. 19. 25. N. Lat. 40. 55.

CANINANA, in zoology, the name of a species of serpent found in America, and esteemed one of the less poisonous kinds. It grows to about two feet long; and is green on the back, and yellow on the belly. It feeds on eggs and small birds; the natives cut off the head and tail, and eat the body as a delicate dish.

CANINE, whatever partakes of, or has any relation to, the nature of a dog.

CANINE Appetite, amounts to much the same with BULIMY.

CANINE Madness. See (the Index subjoined to) MEDICINE.

CANINE Teeth, are two sharp edged teeth in each jaw; one on each side, placed between the incisores and molares.

CANINI (John Angelo and Marc Anthony,) brothers and Romans, celebrated for their love of antiquities. John excelled in designs for engraving on stones, particularly heads; Marc engraved them. They were encouraged by Colbert to publish a succession of heads of the heroes and great men of antiquity, designed from medals, antique stones, and other ancient remains; but John died at Rome soon after the work was begun: Marc Anthony, however, procured assistance, finished and published it in Italian in 1669. The cuts of this edition were engraved by Canini, Picard, and Valet; and a curious explanation is given, which discovers the skill of the Canini's in history and mythology. The French edition of Amsterdam, 1731, is spurious.

CANIS, or DOG, in zoology, a genus of quadrupeds, belonging to the order of *feræ*. The characters of the dog are these: he has six fore-teeth in the upper jaw, those in the sides being longer than the intermediate ones, which are lobated; in the under jaw there are likewise six fore-teeth, those on the sides being lobated. He has six grinders in the upper, and seven in the lower jaw. The teeth called *dog-teeth* are four, one on each side, both in the lower and upper jaw; they are sharp-pointed, bent a little inward, and stand at a distance from any of the rest.

There are 14 species of this genus, viz.

I. The FAMILIARIS, or Domestic Dog, is distinguished from the other species by having his tail bent to the left side; which mark is so singular, that perhaps the tail of no other quadruped is bent in this manner. Of this species there are a great number of varieties. Linnaeus enumerates 11, and Buffon gives figures of no less than 27. The mastiff is about the size of a wolf, with the sides of the lips hanging down, and a full robust body. The large Danish dog differs only from the former in being fuller in the body, and generally of a larger size. The greyhound is likewise the same with the mastiff; but its make is more slender and delicate. Indeed the difference betwixt these three dogs, although perfectly distinguishable at first sight, is not greater than that betwixt a Dutchman, a Frenchman, and an Italian. The shepherd's dog, the wolf-dog, and what is commonly called the *Siberian dog*, to which may be joined the Lapland dog, the Canada dog, and, in general, all those which have straight ears and a pointed snout, are all one kind, differing only in thickness, the roughness or smoothness of their skin, the length of their legs and tails. The hound or beagle, the terrier, the braque or harrier, and the spaniel, may be considered as the same kind: they have the same form and the same instincts; and differ only in the length of their legs, and size of their ears, which in each of them are long, soft, and pendulous. The bull-dog, the small Danish dog, the Turkish dog, and the Iceland dog, may likewise be considered as the same kind, all the varieties in their appearance taking their rise merely from climate. For instance, the Turkish dog, which has no hair, is nothing else but the small Danish dog transported to a warm climate, which makes the hair fall off. A dog of any kind loses its hair in very warm climates. But this is not the only change which arises from difference of climate. In some countries, the voice is changed;

and CXX.

Canis.

ged; in others, dogs become altogether silent. In some climates they lose the faculty of barking, and howl like wolves, or yelp like foxes. Warm climates even change their form and instincts: they turn ill-shaped, and their ears become straight and pointed. It is only in temperate climes that dogs preserve their natural courage, ardour, and sagacity.

Dr Caius has left, among several other tracts relating to natural history, one written expressly on the species of British dogs; besides a description of the variety of dogs then existing in this country, he has added a systematic table of them, which we shall here insert, and explain by a brief account of each kind.

SYNOPSIS OF BRITISH DOGS.

I. The most generous kinds.	Dogs of chase.	Hounds.	Terrier Harrier Blood-hound
			Gaze-hound Gre-hound Leviner, or Lyemmer Tumbler
	Fowlers.		Spaniel Setter Water-spaniel, or finder
II. Farm Dogs.	Lap Dogs.		Spaniel gentle, or comforter Shepherd's dog Mastiff, or ban dog.
			Wappe Turnspit Dancer.

1. a. The first variety is the *terrarius* or terrier, which takes its name from its subterraneous employ; being a small kind of hound used to force the fox or other beasts of prey out of their holes; and, in former times, rabbits out of their burrows into nets.

b. The *leverarius*, or harrier, is a species well known at present: it derives its name from its use, that of hunting the hare; but under this head may be placed the fox hound, which is only a stronger and fleetier variety, applied to a different chase.

c. The *sanguinarius*, blood-hound, or *steut-hounde* of the Scots, was a dog of great use, as already noticed under the article *Blood-Hound*.

The next subdivision of this species of dogs comprehends those that hunt by the eye; and whose success depends either upon the quickness of their sight, their swiftness, or their subtilty.

d. The *agaseus*, or gaze-hound, was the first: it chased indifferently the fox, hare, or buck. It would select from the herd the fattest and fairest deer; pursue it by the eye; and, if lost for a time, recover it again by its singular distinguishing faculty; nay, should the beast rejoin the herd, this dog would fix unerringly on the same. This species is now lost, or at least unknown to us.

e. The next kind is the *leporarius*, or gre-hound. Dr Caius informs us, that it takes its name *quod præcipui*

gradus sit inter canes, "the first in rank among dogs:" that it was formerly esteemed so, appears from the forest-laws of king Canute, who enacted that no one under the degree of a gentleman should presume to keep a gre-hound; and still more strongly from an old Welsh saying which signifies, that "you may know a gentleman by his hawk, his horse, and his gre-hound."

The variety called the *Highland gre-hound*, and now become very scarce, is of very great size, strong, deep-chested, and covered with long rough hair. This kind was much esteemed in former days, and used in great numbers by the powerful chieftains in their magnificent hunting-matches. It had as sagacious nostrils as the blood-hound, and was as fierce.

f. The third species is the *levinarius*, or *lorarius*; the *leviner* or *lyemmer*: the first name is derived from the lightness of the kind; the other from the old word *lyemme*, a thong; this species being used to be led in a thong, and slipped at the game. Our author says that this dog was a kind that hunted both by scent and fight; and in the form of its body observed a medium between the hound and the gre-hound. This probably is the kind now known among us by the name of the *Irish gre-hound*, a dog now extremely scarce in that kingdom, the late king of Poland having procured from them as many as possible. They were of the kind called by Buffon *le grand Danois*, and probably imported there by the Danes who long possessed that kingdom. Their use seems originally to have been for the chase of wolves with which Ireland swarmed till the latter end of the last century. As soon as these animals were extirpated, the numbers of the dogs decreased; for, from that period, they were kept only for state.

g. The *vertagus*, or tumbler, is a fourth species; which took its prey by mere subtilty, depending neither on the sagacity of its nose, nor its swiftness: if it came into a warren, it neither barked, nor ran on the rabbits; but by a seeming neglect of them, or attention to something else, deceived the object till it got within reach, so as to take it by a sudden spring. This dog was less than the hound, more scraggy, had pricked up ears, and by Dr Caius's description seems to answer to the modern lurcher.

The third subdivision of the more generous dogs comprehends those which were used in fowling.

h. First, the *Hispaniolus*, or spaniel; from the name, it may be supposed that we were indebted to Spain for this breed. There were two varieties of this kind: the first used to spring the game, which are the same with our starters. The other variety was used only for the net, and was called *index* or the setter; a kind well known at present. This kingdom has been long remarkable for producing dogs of this sort, particular care having been taken to preserve the breed in the utmost purity. They are still distinguished by the name of *English Spaniels*; so that, notwithstanding the derivation of the name, it is probable they are natives of Great Britain.

i. The *aquaticus*, or finder, was another species used in fowling; was the same with our water-spaniel; and was used to find or recover the game that was shot.

k. The *Meliteus*, or *fotor*, the spaniel gentle or comforter of Dr Caius (the modern lap-dog), was the last of this division. The Maltese little dogs were as much esteemed by the fine ladies of past times as those of Bologna are among the modern. Old Hollingshed is ridiculously severe on the fair of his days for their

Canis.

Canis.

* The reign
of Queen
Elizabeth.

excessive passion for these little animals; which is sufficient to prove that it was, in his time*, a novelty.

2. The second grand division of dogs comprehends the *rustici*, or those that were used in the country.

a. The first species is the *pastoralis*, or shepherd's dog; which is the same that is used at present, either in guarding our flocks, or in driving herds of cattle. This kind is so well trained for these purposes as to attend to every part of the herd, be it ever so large; confine them to the road; and force in every straggler, without doing it the least injury.

b. The next is the *villaticus*, or *catenarius*; the mastiff or ban dog; a species of great size and strength, and a very loud barker. Caius tells us that three of these were reckoned a match for a bear; and four for a lion: but from an experiment made in the Tower of London, that noble quadruped was found an unequal match to only three. Two of the dogs were disabled in the combat, but the third forced the lion to seek for safety by flight. The English bull-dog seems to belong to this species; and probably is the dog our author mentions under the title of *lanarius*. Great Britain was so noted for its mastiffs, that the Roman emperors appointed an officer in this island under the name of *procurator synegii*, whose sole business was to breed, and transmit from hence to the amphitheatre, such as would prove equal to the combats of the place. Grattius speaks in high terms of the excellency of the British dog.

Cynegaticon,
lin. 175.

Atque ipsos libeat penetrare Britannos?

O quanta est merces, et quantum impendia supra!

Si non ad speciem, mentiturosq; decores

Protinus: hæc una est catulis jactura Britannis.

At magnum cum venit opus, præmendaque virtus,

Et vocat extremo præceps discrimine Mavors,

Non tunc egregios tantum admirare Molossos.

If Britain's distant coast we dare explore,
How much beyond the coast the valued store?

If shape and beauty not alone we prize,
Which nature to the British hound denies:

But when the mighty toil the huntsman warms,
And all the soul is rous'd by fierce alarms,
When Mars calls furious to th' ensanguin'd field,
Even bold *Molossians* then to these must yield.

Strabo tells us that the mastiffs of Britain were trained to war, and were used by the Gauls in their battles; and it is certain a well trained mastiff might be of use in distressing such half-armed and irregular combatants as the adversaries of the Gauls seem generally to have been before the Romans conquered them.

3. The last division is that of the *degeneres*, or curs.

a. The first of these was the *wappe*, a name derived from its note; its only use was to alarm the family by barking, if any person approached the house.

b. Of this class was the *versator*, or turn-spit; and lastly the *salitator* or dancing-dog; or such as was taught variety of tricks, and carried about by idle people as a shew. These *degeneres* were of no certain shape, being mongrels or mixtures of all kinds of dogs.

M. de Buffon has given a genealogical table of all the known dogs, in which he makes the *chien de berger*, or shepherd's dog, the origin of all, because it is naturally the most sensible. This table or tree is intended not only to exhibit the different kinds of dogs, but

to give an idea of their varieties as arising from a degeneration in particular climates, and from a commixture of the different races. It is constructed in the form of a geographical chart, preserving as much as possible the position of the different climates to which each variety naturally belongs. The shepherd's dog, as already mentioned, is the root of the tree. This dog, when transported into Lapland, or other very cold climates, assumes an ugly appearance, and shrinks into a smaller size: but, in Russia, Iceland, and Siberia, where the climate is less rigorous, and the people a little more advanced in civilization, he seems to be better accomplished. These changes are occasioned solely by the influence of those climates, which produce no great alteration in the figure of this dog; for, in each of these climates, his ears are erect, his hair thick and long, his aspect wild, and he barks less frequently, and in a different manner, than in more favourable climates, where he acquires a finer polish. The Iceland dog is the only one that has not his ears entirely erect; for their extremities are a little inclined; and Iceland, of all the northern regions, has been longest inhabited by half civilized men.

The same shepherd's dog, when brought into temperate climates, and among a people perfectly civilized, as Britain, France, Germany, would, by the mere influence of the climate, lose his savage aspect, his erect ears, his rude, thick, long hair, and assume the figure of a bull dog, the hound, and the Irish greyhound. The bull-dog and Irish greyhound have their ears still partly erect, and very much resemble, both in their manners and sanguinary temper, the dog from which they derive their origin. The hound is farthest removed from the shepherd's dog; for his ears are long and entirely pendulous. The gentleness, docility, and even the timidity of the hound, are proofs of his great degeneration, or rather of the great perfection he has acquired by the long and careful education bestowed on him by man.

The hound, the harrier, and the terrier, constitute but one race; for, it has been remarked, that in the same litter, hounds, harriers, and terriers, have been brought forth, though the female hound had been covered by only one of these three dogs. I have joined the common harrier to the Dalmatian dog, or harrier of Bengal, because they differ only in having more or fewer spots on their coat. I have also linked the turn-spit, or terrier with crooked legs, with the common terrier; because the defect in the legs of the former has originally proceeded from a disease similar to the rickets, with which some individuals had been affected, and transmitted the deformity to their descendants.

The hound, when transported into Spain and Barbary, where all animals have fine, long, bushy hair, would be converted into the spaniel and water-dog. The great and small spaniel, which differ only in size, when brought into Britain, have changed their white colour into black, and become, by the influence of climate, the great and little King Charles's dog: To these may be joined the pyrame, which is only a King Charles's dog, black like the others, but marked with red on the four legs, and a spot of the same colour above each eye, and on the muzzle.

The Irish greyhound, transported to the north, is become the great Danish dog; and, when carried to the south, was converted into the common greyhound.

The

CXXXI.

Shepherds Dog.*Pomeranian D.**Siberian D.**Iceland D.**Gre-hound.**Irish Gre-hound.**Danish D.*

[Faint, illegible text, likely bleed-through from the reverse side of the page]

Canis.

The largest gre-hounds come from the Levant, those of a smaller size from Italy; and those Italian gre-hounds, carried into Britain, have been still farther diminished.

The great Danish dog, transported into Ireland, the Ukraine, Tartary, Epirus, and Albania, has been changed into the Irish gre-hound, which is the largest of all dogs.

The bull-dog, transported from Britain to Denmark, is become the little Danish dog; and the latter, brought into warm climates, has been converted into the Turkish dog. All these races, with their varieties, have been produced by the influence of climate, joined to the effects of shelter, food, and education. The other dogs are not pure races, but have proceeded from commixtures of those already described. I have marked, in the table, by dotted lines, the double origin of these mongrels.

The gre-hound and Irish gre-hound have produced the mongrel gre-hound, called also the gre-hound with wolf's hair. The muzzle of this mongrel is less pointed than that of the true gre-hound, which is very rare in France.

The great Danish dog and the large spaniel have produced the Calabrian dog, which is a beautiful animal, with long bushy hair, and larger than the Irish gre-hound.

The spaniel and terrier have produced the dog called *burgos*.

From the spaniel and little Danish dog has proceeded the lion-dog, which is now very rare.

The dogs with long, fine, crisped hair, called the *bouffe dogs*, and which are larger than the water-dog, proceed from the spaniel and water-dog.

The little water-dog comes from the water-dog and small spaniel.

From the bull-dog and Irish gre-hound proceeds a mongrel called the *maffiff*, which is larger than the bull-dog, and resembles the latter more than the Irish gre-hound.

The pug-dog proceeds from the bull-dog and small Danish dog.

All these dogs are simple mongrels, and are produced by the commixture of two pure races. But there are other dogs, called *double mongrels*, because they proceed from the junction of a pure race with a mongrel. The bastard pug-dog is a double mongrel from a mixture of the pug-dog with the little Danish dog. The Alicant dog is also a double mongrel, proceeding from the pug-dog and small spaniel. The Maltese, or lap-dog, is a double mongrel, produced between the small spaniel and little water-dog.

Lastly, there are dogs which may be called *triple mongrels*, because they are produced by two mixed races. Of this kind are the Artois and Islois dogs, which are produced by the pug-dog and the bastard pug-dog; to which may be added the dogs called *street-dogs*, which resemble no particular kind, because they proceed from races which have previously been several times mixed.

THE following is a systematic catalogue of all the known dogs, as arranged by Mr Pennant in his *History of Quadrupeds*:

1. Shepherd's dog (*Canis domesticus*, Lin. *Le Chien*

de Berger, Buff.); so called, because it becomes without discipline almost instantly the guardian of the flocks, keeps them within bounds, reduces the stragglers to their proper limits, and defends them from the attacks of the wolves. We have this variety in England; but it is small and weak. It is the *pastoralis* of Caius above mentioned. Those of France and the Alps are very large and strong; sharp-nosed; erect and sharp eared; very hairy, especially about the neck; and have their tails turned up or curled: and by accident their faces often show the marks of their combats with the wolf.

Its varieties or nearest allies are: *a*, Pomeranian dog. *b*, Siberian dog. The other varieties in the inland parts of the empire and Siberia noticed by Buffon, are chiefly from the shepherd's dog: and there is a high-limbed taper-bodied kind, the common dog of the Calmuc and independent Tartars, excellent for the chase and all uses.

2. The hound, or dog with long, smooth, and pendulous ears. This is the same with the blood-hound in Caius's Table, (*le Chien courant*, Buff. *Canis sagax*, Lin.). It is the head of the other kinds with smooth and hanging ears: *a*, Harrier; *b*, Dalmatian, vulgarly the Danish, a beautiful spotted dog; *c*, Turnspit; *d*, Water-dog, great and small.

From this stock branches out another race with pendent ears, covered with long hairs, and less in size; which form,

3. The Spaniel; (*Canis avicularius*, Lin.) Those of this kind vary in size from the setting dog to the springing spaniels, and some of the little lap-dogs; as,

a, King Charles's. Charles II. never went out except attended by numbers of this kind. *b*, *Le pyrame* of Buffon. For this sort, though common in Britain, there is no English name. It is black, marked on the legs with red, and having a spot of the same colour above each eye. *c*, The Shock-dog.

4. Dogs with short pendent ears, and long legs and bodies; as,

a, Irish gre-hound; (*le Matin*, Buff.): a variety once very frequent in Ireland, and used in the chase of the wolf; now very scarce. Probably the same with the leviner in Caius's table, described above.

b, Common gre-hound, described above under Caius's table; (*le Levrier et Schreiber*, Buff. *Canis graius*, Lin.) Its varieties are, 1. Italian gre-hound, small and smooth: 2. Oriental gre-hound, tall, slender, with very pendulous ears, and very long hairs on the tail hanging down a great length.

c, Danish dog, of a stronger make than a gre-hound: the largest of dogs; (*le Grand Danois*, Buff.) Mr Pennant thinks it probable, that of this kind were the dogs of Epirus, mentioned by Aristotle, lib. iii. c. 21; or those of Albania, the modern Schirwan or East Georgia, so beautifully described by Pliny, lib. viii. c. 40. Perhaps to this head may be referred the vast dogs of Thibet, said by Marco Paolo to be as big as asses, and used in that country to take wild beasts, and especially the wild oxen called *Beyamini*.

d, Mastiff, (*le Dogue de forte race*, Buff. *Canis molossus*, Lin.): Very strong and thick made; the head large; the lips great, and hanging down on each side; a fine and noble countenance; grows to a great size. A British kind. See above under Dr Caius's table.

5. Dogs with short pendent ears, short compact bodies.

Canis.

Canis.

bodies, short noses, and generally short legs. *a*, Bull-dog (*le Dogue*, Buff.), with a short nose, and under jaw longer than the upper: a cruel and very fierce kind, often biting before it barks; peculiar to England; the breed scarcer than it has been since the barbarous custom of bull-baiting has declined. *b*, Pug-dog, (*le Doguin*, Buff.): A small species; an innocent resemblance of the last. *c*, Bastard pug, (*le Roquet*, Buff.) *d*, Naked, (*le chien Turc*, Buff.): A degenerate species with naked bodies; having lost their hair by the heat of climate.

Dogs are found in the Society islands, New Zealand, and the Low islands; there are also a few in New Holland. Of these are two varieties:

a, Resembling the sharp-nosed pricked-ear shepherd's cur. Those of New Zealand are of the largest sort. In the Society islands they are the common food, and are fattened with vegetables, which the natives cram down their throats as we serve turkeys when they will voluntarily eat no more. They are killed by strangling, and the extravasated blood is preserved in cocoa-nut shells, and baked for the table. They grow very fat, and are allowed, even by Europeans who have got over their prejudices, to be very sweet and palatable. But the taste for the flesh of these animals was not confined to the islanders of the Pacific ocean. The ancients reckoned a young and fat dog excellent food, especially if it had been castrated: Hippocrates placed it on a footing with mutton and pork; and in another place says, that the flesh of a grown dog is wholesome and strengthening, of puppies relaxing. The Romans admired sucking puppies: they sacrificed them also to their divinities, and thought them a supper in which the gods themselves delighted.

b, The barbet, whose hair being long and filky, is greatly valued by the New-Zelanders for trimming their ornamental drefs. This variety is not eaten. The islanders never use their dogs for any purposes but what we mention; and take such care of them as not to suffer them even to wet their feet. They are excessively stupid, have a very bad nose for smelling, and seldom or never bark, only now and then howl. The New Zealanders feed their dogs entirely with fish.

The Marquesas, Friendly Islands, New Hebrides, New Caledonia, and Easter Isle, have not yet received those animals.

HAVING thus traced the varieties of the Dog, and noticed the peculiarities of each, we shall now give its general natural history.

From the structure of the teeth, it might be concluded *a priori* that the dog is a carnivorous animal. He does not, however, eat indiscriminately every kind of animal substance. There are some birds, as the *colymbus arcticus*, which the water-dog will lay hold of with keenness, but will not bring out of the water, because its smell is exceedingly offensive to him. He will not eat the bones of a goose, crow, or hawk: but he devours even the putrid flesh of most other animals. He is possessed of such strong digestive powers, as to draw nourishment from the hardest bones. When flesh cannot be procured, he will eat fish, fruits, succulent herbs, and bread of all kinds. When oppressed with sickness, to which he is very subject, especially in the beginning of summer, and before ill weather, in order

to procure a puke, he eats the leaves of the quicken-grass, the bearded wheat-grass, or the rough cock's-foot grass, which gives him immediate relief. When he steals a piece of flesh, as conscious of the immorality of the action, he runs off with his tail hanging and bent in betwixt his feet.

His drink is water, which he takes in small quantities at a time, by licking with his tongue. He is in some measure obliged to lick in this manner, otherwise his nose would be immersed in the water.

His excrements are generally hard scybals, which, especially after eating bones, are white, and go by the name of *album græcum* among physicians. This album græcum was for a long time in great repute as a septic; but it is now entirely disregarded. He does not throw out his excrements promiscuously upon every thing that happens to be in the way, but upon stones, trunks of trees, or barren places. This is a wise institution of nature; for the excrements of a dog destroy almost every vegetable or animal substance. They are of such a putrid nature, that if a man's shoe touches them when recently expelled, that particular part will rot in a few days. He observes the same method in making his urine, which he throws out at a side. It is remarkable, that a dog will not pass a stone or a wall against which any other dog has pissed, without following his example, although a hundred should occur in a few minutes, in so much that it is astonishing how such a quantity can be secreted in so short a time.

The dog is an animal not only of quick motion, but remarkable for travelling very long journeys. He can easily keep up with his master, either on foot or horseback, for a whole day. When fatigued, he does not sweat, but lolls out his tongue. Every kind of dog can swim; but the water-dog excels in that article.

The dog runs round when about to lie down, in order to discover the most proper situation. He lies generally on his breast, with his head turned to one side, and sometimes with his head above his two fore-feet. He sleeps little, and even that does not seem to be very quiet; for he often starts, and seems to hear with more acuteness in sleep than when awake. They have a tremulous motion in sleep, frequently move their legs, and bark, which is an indication of dreaming.

Dogs are possessed of the sensation of smelling in a high degree. They can trace their master by the smell of his feet in a church, or in the streets of a populous city. This sensation is not equally strong in every kind. The hound can trace game, or his master's steps, 24 hours afterwards. He barks more furiously the nearer he approaches the fowls, unless he be beat and trained to silence.

The dog eats enviously, with oblique eyes; is an enemy to beggars; bites at a stone flung at it; is fond of licking wounds; howls at certain notes in music, and often urines on hearing them.

With regard to the propagation of dogs, the females admit the males before they are 12 months old. They remain in season 10, 12, or even 15 days, during which time they will admit a variety of males. They come in season generally twice in the year, and more frequently in the cold than in the hot months. The male discovers the condition of the female by the smell; but she seldom admits him the first six or seven days. One coitus

Canis.

Canis.

coitus will make her conceive a great number of young; but, when not restrained, she will admit several dogs every day: she seems to have no choice or predilection, except in favour of large dogs: from this circumstance it sometimes happens, that a small female, who has admitted a mastiff, perishes in bringing forth her young. During the time of copulation, these animals cannot separate themselves, but remain united so long as the erection subsists. This is owing to the structure of the parts. The dog has not only a bone in his penis, but in the middle of the corpus cavernosum there is a large hollow, which is blown up in the time of erection to a considerable bulk. The female, on the other hand, has a larger clitoris than perhaps any other animal: besides, a large firm protuberance rises in the time of copulation, and remains perhaps longer than that of the male, and prevents him from retiring till it subsides: accordingly, after the act of copulation is over, the male turns about in order to rest himself on his legs, and remains in that position till the parts turn flaccid. The female goes with young about nine weeks. They generally bring forth from six to twelve puppies. Those of a small size bring forth five, four, and sometimes but two. They continue to copulate and bring forth during life, which lasts generally about 14 or 15 years. The whelps are commonly blind, and cannot open their eyes till the 10th or 12th day: the males are like the dog, the females like the bitch. In the fourth month, they lose some of their teeth, which are soon succeeded by others.

The dog has such a strong resemblance to the wolf and the fox, that he is commonly supposed to be the production of one or other of these animals tamed and civilized. Buffon informs us, that he kept a young dog and a young wolf together till they were three years of age, without their discovering the least inclination to copulate. He made the same experiment upon a dog and a fox; but their antipathy was rather increased when the female was in season. From these experiments he concludes, that dogs, wolves, and foxes, are perfectly distinct genera of animals. There has, however, been lately an instance to the contrary: Mr Brooke, animal-merchant in Holborn, turned a wolf to a Pomeranian bitch in heat; the congress was immediate, and as usual between dog and bitch: she produced ten puppies. Mr Pennant saw one of them at Gordon Castle, that had very much the resemblance of a wolf, and also much of its nature; being slipped at a weak deer, it instantly caught at the animal's throat and killed it. "I could not learn (says Mr Pennant) whether this mongrel continued its species; but another of the same kind did, and stocked the neighbourhood of Fochabers, in the county of Moray (where it was kept), with a multitude of curs of a most wolfish aspect.—There was lately living a mongrel offspring of this kind. It greatly resembled its wolf parent. It was first the property of Sir Wolstein Dixey; afterwards of Sir Willughby Aston. During day it was very tame; but at night sometimes relapsed into ferocity. It never barked, but rather howled; when it came into fields where sheep were it would feign lameness, but if no one was present would instantly attack them. It had been seen in copulation with a bitch, which afterwards pupped: the breed was imagined to resemble in many respects the supposed

fire. It died between the age of five and six.—The bitch will also breed with the fox. The woodman of the manor of Mongewell, in Oxfordshire, has a bitch, which constantly follows him, the offspring of a tame dog-fox by a shepherd's cur; and she again has had puppies by a dog. Since there are such authentic proofs of the further continuance of the breed, we may surely add the wolf and fox to the other supposed stocks of these faithful domestics."

With regard to the natural disposition of the dog: in a savage state, he is fierce, cruel, and voracious; but, when civilized and accustomed to live with men, he is possessed of every amiable quality. He seems to have no other desire than to please and protect his master. He is gentle, obedient, submissive, and faithful. These dispositions, joined to his almost unbounded sagacity, justly claim the esteem of mankind. Accordingly no animal is so much caressed or respected: he is so ductile, and so much formed to please, that he assumes the very air and temper of the family in which he resides.

An animal endowed with such uncommon qualities must answer many useful purposes. His fidelity and vigilance are daily employed to protect our persons, our flocks, or our goods. The acuteness of his smell gains him employment in hunting: he is frequently employed as a turnspit: at Brussels and in Holland he is trained to draw little carts to the herb-market; and in the northern regions draws a sledge with his master in it, or loaden with provisions. The Kamschatkans, Esquimaux, and Greenlanders, strangers to the softer virtues, treat these poor animals with great neglect. The former, during summer, the season in which they are useless, turn them loose to provide for themselves; and recall them in October into their usual confinement and labour: from that time till spring they are fed with fish-bones and *opana*, i. e. putrid fish preserved in pits, and served up to them mixed with hot water. Those used for draught are castrated; and four, yoked to the carriage, will draw five poods, or a hundred and ninety English pounds, besides the driver; and thus loaden, will travel 30 versts, or 20 miles a-day; or if unloaden, on hardened snow, on sliders of bone, a hundred and fifty versts, or a hundred English miles.

It is pretty certain, Mr Pennant observes, that the Kamschatkan dogs are of wolfish descent; for wolves abound in that country, in all parts of Siberia, and even under the arctic circle. If their master is flung out of his sledge, they want the affectionate fidelity of the European kind, and leave him to follow, never stopping till the sledge is overturned, or else stopped by some impediment. The great traveller of the 13th century, Marco Polo, had knowledge of this species of conveyance from the merchants who went far north to traffic for the precious furs. He describes the sledges; adds, that they were drawn by six great dogs; and that they changed them and the sledges on the road, as we do at present in going post. The Kamschatkans make use of the skins of dogs for clothing, and the long hair for ornament: some nations are fond of them as a food; and reckon a fat dog a great delicacy. Both the Asiatic and American savages use these animals in sacrifices to their gods, to bespeak favour or avert evil. When the Koreki dread any infection, they kill a dog, wind the intestines round two poles, and pass between them.

The

Canis.

The Greenlanders are not better masters. They leave their dogs to feed on muscles or berries; unless in a great capture of seals, when they treat them with the blood and garbage. These people also sometimes eat their dogs; use the skins for coverlets, for clothing, or to border and seam their habits; and their best thread is made of the guts. These northern dogs in general are large; and in the frigid parts at least have the appearance of wolves: are usually white, with a black face; sometimes varied with black and white, sometimes all white; rarely brown or all black: have sharp noses, thick hair, and short ears; and seldom bark, but set up a sort of growl or savage howl. They sleep abroad; and make a lodge in the snow, lying with only their noses out. They swim most excellently; and will hunt in packs the ptarmigan, arctic fox, polar bear, and seals lying on the ice. The natives sometimes use them in the chase of the bear. They are excessively fierce; and, like wolves, instantly fly on the few domestic animals introduced into Greenland. They will fight among themselves even to death. Canine madness is unknown in Greenland. Being to the natives in the place of horses, the Greenlanders fasten to their sledges from four to ten; and thus make their visits in savage state, or bring home the animals they have killed. Egede says that they will travel over the ice 15 German miles in a day, or 60 English, with sledges loaden with their masters and five or six large seals.

Those of the neighbouring island of Iceland have a great resemblance to them. As to those of Newfoundland, it is not certain that there is any distinct breed: most of them are curs, with a cross of the mastiff: some will, and others will not, take the water, absolutely refusing to go in. The country was found uninhabited, which makes it more probable that they were introduced by the Europeans; who use them, as the factory does in Hudson's bay, to draw firing from the woods to the forts. The savages who trade to Hudson's bay make use of the wolfish kind to draw their furs.

It is singular, that the race of European dogs show as strong an antipathy to this American species as they do to the wolf itself. They never meet with them, but they show all possible signs of dislike, and will fall on and worry them; while the wolfish breed, with every mark of timidity, puts its tail between its legs, and runs from the rage of the others. This aversion to the wolf is natural to all genuine dogs; for it is well known that a whelp, which has never seen a wolf, will at first fight tremble, and run to its master for protection: an old dog will instantly attack it. Yet these animals may be made to breed with one another as above shown; and the following abstract of a letter from Dr Pallas to Mr Pennant, dated October 5th 1781, affords a further confirmation of the fact. "I have seen at Moscow about twenty spurious animals from dogs and black wolves. They are for the most part like wolves, except that some carry their tails higher, and have a kind of hoarse barking. They multiply among themselves: and some of the whelps are greyish, rusty, or even of the whitish hue of the arctic wolves; and one of those I saw, in shape, tail, and hair, and even in barking, so like a cur, that was it not for his head and ears, his ill-natured look, and

N^o 63.

fearfulness at the approach of man, I should hardly have believed that it was of the same breed."

The dog is liable to many diseases, as the scab, madness, &c. and he seldom wants the tænia or tape-worm in his guts, especially if he drinks dirty water.

II. The second species of this genus is the *LUPUS*, The Wolf, or Wolf. He has a long head, pointed nose, ears erect and sharp, long legs well clothed with hair; tail bushy and bending down, with the tip black; head and neck ash-coloured; body generally pale brown tinged with yellow: sometimes found white, and sometimes entirely black. The wolf is larger and fiercer than a dog. His eyes sparkle, and there is a great degree of fury and wildness in his looks. He draws up his claws when he walks, to prevent his tread from being heard. His neck is short, but admits of very quick motion to either side. His teeth are large and sharp; and his bite is terrible, as his strength is great. The wolf, cruel, but cowardly and suspicious, flies from man; and seldom ventures out of the woods, except pressed by hunger: but when this becomes extreme, he braves danger, and will attack men, horses, dogs, and cattle of all kinds; even the graves of the dead are not proof against his rapacity. These circumstances are finely described, in the following lines:

By wintry famine rous'd, ———
Cruel as death, and hungry as the grave!
Burning for blood! bony, and ghastly, and grim!
Assembling wolves in raging troops descend;
And, pouring o'er the country, bear along,
Keen as the north-wind sweeps the glossy snow.
All is their prize. They fasten on the steed,
Press him to earth, and pierce his mighty heart.
Nor can the bull his awful front defend,
Or shake the murdering savages away.
Rapacious at the mother's throat they fly,
And tear the screaming infant from her breast.
The god-like face of man avails him nought.
Even beauty, force divine! at whose bright glance
The generous lion stands in soften'd gaze,
Here bleeds, a hapless undistinguish'd prey.
But if, appris'd of the severe attack,
The country be shut up, lur'd by the scent,
On church-yards drear (inhuman to relate!)
The disappointed prowlers fall, and dig
The shrouded body from the grave; o'er which,
Mix'd with foul shades and frighted ghosts, they howl.

THOMSON'S WINTER.

The wolf, unlike the dog, is an enemy to all society, and keeps no company even with those of his own species. When several wolves appear together, it is not a society of peace, but of war; it is attended with tumult and dreadful prowlings, and indicates an attack upon some large animal, as a stag, an ox, or a formidable mastiff. This military expedition is no sooner finished, than they separate, and each returns in silence to his solitude. There is even little intercourse between the males and females: They feel the mutual attractions of love but once a-year, and never remain long together. The females come in season in winter: many males follow the same female; and this association is more bloody than the former; for they growl, chafe, fight, and tear one another, and often sacrifice

him

him that is preferred by the female. The female commonly flies a long time, fatigues her admirers, and retires, while they sleep, with the most alert or most favourite male.

The season of love continues only twelve or fifteen days; it commences with the oldest females; the young ones are not so early disposed. The males have no marked period, but are equally ready at all times. They go from female to female, according as they are in a condition to receive them. They begin with the old females about the end of December, and finish with the young ones in the month of February or beginning of March. The time of gestation is about three months and a half; and young whelps are found from the end of April to the month of July. The wolves copulate like the dogs, and have an osseous penis, surrounded with a ring, which swells and hinders them from separating. When the females are about to bring forth, they search for a concealed place in the inmost recesses of the forest. After fixing on the spot, they make it smooth and plain for a considerable space, by cutting and tearing up with their teeth all the brambles and brush-wood. They then bring great quantities of moss, and prepare a commodious bed for their young, which are generally five or six, though sometimes they bring forth seven, eight, and even nine, but never less than three. They come into the world blind, like the dogs; the mother suckles them some weeks, and soon learns them to eat flesh, which she prepares for them by tearing it into small pieces. Some time after she brings them field-mice, young hares, partridges, and living fowls. The young wolves begin by playing with these animals, and at last worry them; then the mother pulls off the feathers, tears them in pieces, and gives a part to each of her young. They never leave their den till the end of six weeks or two months. They then follow their mother, who leads them to drink in the hollow trunk of a tree, or in some neighbouring pool. She conducts them back to the den, or, when any danger is apprehended, obliges them to conceal themselves elsewhere. Though, like other females, the she-wolf is naturally more timid than the male; yet when her young are attacked, she defends them with intrepidity; she loses all sense of danger, and becomes perfectly furious. She never leaves them till their education is finished, till they are so strong as to need no assistance or protection, and have acquired talents fit for rapine, which generally happens in ten or twelve months after their first teeth (which commonly fall out in the first month) are replaced.

Wolves acquire their full growth at the end of two or three years, and live 15 or 20 years. When old, they turn whitish, and their teeth are much worn. When full, or fatigued, they sleep, but more during the day than the night, and it is always a kind of slight slumber. They drink often; and, in the time of drought, when there is no water in the hollows, or in the trunks of old trees, they repair, several times in a day, to the brooks or rivulets. Though extremely voracious, if supplied with water, they can pass four or five days without meat.

The wolf has great strength, especially in the anterior parts of the body, in the muscles of the neck and jaws. He carries a sheep in his mouth, and, at the same time, outruns the shepherds; so that he can only

be stopped or deprived of his prey by dogs. His bite is cruel, and always more obstinate in proportion to the smallness of the resistance; for when an animal can defend itself, he is cautious and circumspect. He never fights but from necessity, and not from motives of courage. When wounded with a ball, he cries; and yet, when dispatching him with bludgeons, he complains not. When he falls into a snare, he is so overcome with terror, that he may be either killed or taken alive without resistance: he allows himself to be chained, muzzled, and led where you please, without exhibiting the least symptom of resentment or discontent.

The senses of the wolf are excellent, but particularly his sense of smelling, which often extends farther than his eye. The odour of carrion strikes him at the distance of more than a league. He likewise scents live animals very far, and hunts them a long time by following their tract. When he issues from the wood, he never loses the wind. He stops upon the borders of the forest, smells on all sides, and receives the emanations of living or dead animals brought to him from a distance by the wind. Though he prefers living to dead animals; yet he devours the most putrid carcases. He is fond of human flesh; and, if stronger, he would perhaps eat no other. Wolves have been known to follow armies, to come in troops to the field of battle, where bodies are carelessly interred, to tear them up, and to devour them with an insatiable avidity. And, when once accustomed to human flesh, these wolves ever after attack men, prefer the shepherd to the flock, devour women, and carry off children. Wolves of this vicious disposition are called *Loups garous* by the French peasants, who suppose them to be possessed with some evil spirits; and of this nature were the *were-wulfs* of the old Saxons.

The wolf inhabits the continents of Europe, Asia, Africa, and America; Kamtschatka, and even as high as the arctic circle. The wolves of North America are the smallest; and, when reclaimed, are the dogs of the natives: the wolves of Senegal the largest and fiercest; they prey in company with the lion. Those of the Cape are grey striped with black; others are black.—They are found in Africa as low as the Cape; and are believed to inhabit New Holland, animals resembling them having been seen there by the late circumnavigators. Dampier's people also saw some half-starved animals in the same country, which they supposed to be wolves. In the east, and particularly in Persia, wolves are exhibited as spectacles to the people. When young, they are learned to dance, or rather to perform a kind of wrestling with a number of men. Chardin tells us, that a wolf, well educated in dancing, is sold at 500 French crowns. This fact proves, that these animals, by time and restraint, are susceptible of some kind of education. M. Buffon brought up several of them: "When young, or during their first year (he informs us), they are very docile, and even caressing; and, if well fed, neither disturb the poultry nor any other animal: but, at the age of 18 months or two years, their natural ferocity appears, and they must be chained, to prevent them from running off and doing mischief. I brought up one till the age of 18 or 19 months, in a court along with fowls, none of which he ever attacked; but, for his first essay, he killed the whole in one night, with-

Canis.

out eating any of them. Another, having broken his chain, run off, after killing a dog with whom he had lived in great familiarity."

Whole countries are sometimes obliged to arm, in order to destroy the wolves. Princes have particular equipages for this species of hunting, which is both useful and necessary. Hunters distinguish wolves into *young*, *old*, and *very old*. They know them by the tracks of their feet. The older the wolf, his feet is the larger. The she-wolf's feet are longer and more slender; her heel is also smaller, and her toes thinner. A good blood-hound is necessary for hunting the wolf: and, when he falls into the scent, he must be coaxed and encouraged; for all dogs have an aversion from the wolf, and proceed with coldness in the chase. When the wolf is raised, the grey-hounds are let loose in pairs, and one is kept for dislodging him, if he gets under cover; the other dogs are led before as a reserve. The first pair are let loose after the wolf, and are supported by a man on horse-back; then the second pair are let loose at the distance of seven or eight hundred paces; and, lastly, the third pair, when the other dogs begin to join and to teaze the wolf. The whole together soon reduce him to the last extremity; and the hunters complete the business by stabbing him with a dagger. The dogs have such a reluctance to the wolf's flesh, that it must be prepared and seasoned before they will eat it. The wolf may also be hunted with beagles or hounds; but as he darts always straight forward, and runs for a whole day without stopping, the chase is irksome, unless the beagles be supported by grey-hounds, to teaze him, and give the hounds time to come up.

Wolves are now so rare in the populated parts of America, that the inhabitants leave their sheep the whole night unguarded: yet the governments of Pennsylvania and New Jersey did some years ago allow a reward of twenty shillings, and the last even thirty shillings, for the killing of every wolf. Tradition informed them what a scourge those animals had been to the colonies; so they wisely determined to prevent the like evil. In their infant state, wolves came down in multitudes from the mountains, often attracted by the smell of the corpses of hundreds of Indians who died of the small-pox, brought among them by the Europeans: but the animals did not confine their insults to the dead, but even devoured in their huts the sick and dying savages.

Besides being hunted, wolves are destroyed by pit-falls, traps, or poison. A peasant in France who kills a wolf, carries its head from village to village, and collects some small reward from the inhabitants: the Kirghis-Cossacks take the wolves by the help of a large hawk called *berkut*, which is trained for the diversion, and will fasten on them and tear out their eyes. Britain, a few centuries ago, was much infested by them. It was, as appears by Hollingshed, very noxious to the flocks in Scotland in 1577; nor was it entirely extirpated till about 1680, when the last wolf fell by the hand of the famous Sir Ewen Cameron. We may therefore with confidence assert the non-existence of these animals, notwithstanding M. de Buffon maintains that the English pretend to the contrary. It has been a received opinion, that the other parts of these kingdoms were in early times delivered from this pest by the care of king Edgar. In England he attempted

to effect it, by commuting the punishments of certain crimes into the acceptance of a certain number of wolves tongues from each criminal; and in Wales by converting the tax of gold and silver into an annual tax of 300 wolves heads. But, notwithstanding these his endeavours, and the assertions of some authors, his scheme proved abortive. We find, that some centuries after the reign of that Saxon monarch, these animals were again increased to such a degree as to become again the object of royal attention: accordingly Edward I. issued out his royal mandate to Peter Corbet to superintend and assist in the destruction of them in the several counties of Gloucester Worcester, Hereford, Salop, and Stafford; and in the adjacent county of Derby (as Camden, p. 902, informs us), certain persons at Wormhill held their lands by the duty of hunting and taking the wolves that infested the country, whence they were styled *wolve-hunt*. To look back into the Saxon times, we find, that in Athelstan's reign wolves abounded so in Yorkshire, that a retreat was built at Flixton in that county, "to defend passengers from the wolves, that they should not be devoured by them:" and such ravages did those animals make during winter, particularly in January, when the cold was severest, that the Saxons distinguished that month by the name of the *wolf-month*. They also called an outlaw *wolf's-head*, as being out of the protection of the law, proscribed, and as liable to be killed as that destructive beast. Ireland was infested by wolves for many centuries after their extinction in England; for there are accounts of some being found there as late as the year 1710, the last presentment for killing of wolves being made in the county of Cork about that time.

In many parts of Sweden the number of wolves has been considerably diminished by placing poisoned carcasses in their way: but in other places they are found in great multitudes. Hunger sometimes compels them to eat lichens: these vegetables were found in the body of one killed by a soldier; but it was so weak, that it could scarcely move. It probably had fed on the lichen vulpinus, which is a known poison to these animals. Madness, in certain years, is apt to seize the wolf. The consequences are often very melancholy. Mad wolves will bite hogs and dogs, and the last again the human species. In a single parish 14 persons were victims to this dreadful malady. The symptoms are the same with those attendant on the bite of a mad dog. Fury sparkles in their eyes; a glutinous saliva distils from their mouths; they carry their tails low, and bite indifferently men and beasts. It is remarkable that this disease happens in the depth of winter, so can never be attributed to the rage of the dog-days. Often, towards spring, wolves get upon the ice of the sea, to prey on the young seals, which they catch asleep: but this repast often proves fatal to them; for the ice, detached from the shore, carries them to a great distance from land, before they are sensible of it. In some years a large district is by this means delivered from these pernicious beasts; which are heard howling in a most dreadful manner, far in the sea. When wolves come to make their attack on cattle, they never fail attempting to frighten away the men by their cries; but the sound of the horn makes them fly like lightning.

There is nothing valuable in the wolf but his skin, which

Canis.

Canis.

which makes a warm durable fur. His flesh is so bad, that it is rejected with abhorrence by all other quadrupeds; and no animal but a wolf will voluntarily eat a wolf. The smell of his breath is exceedingly offensive. As, to appease hunger, he swallows indiscriminately every thing he can find, corrupted flesh, bones, hair, skins half tanned and covered with lime, he vomits frequently, and empties himself oftener than he fills. In fine, the wolf is consummately disagreeable; his aspect is base and savage, his voice dreadful, his odour insupportable, his disposition perverse, his manners ferocious; odious and destructive when living, and, when dead, he is perfectly useless.

Hyæna.

III. The HYÆNA has a straight jointed tail, with the hair of its neck erect, small naked ears, and four toes on each foot. It inhabits Asiatic Turkey, Syria, Persia, and Barbary. Like the jackal, it violates the repositories of the dead, and greedily devours the putrid contents of the grave; like it, preys on the herds and flocks; yet, for want of other food, will eat the roots of plants, and the tender shoots of the palms: but, contrary to the nature of the former, it is an unfociable animal; is solitary, and inhabits the chafms of the rocks. The superstitious Arabs, when they kill one, carefully bury the head, lest it should be employed for magical purposes; as the neck was of old by the Theffalian forcerefs.

Viscera non lyncis, non dira nodus hyæna

Defuit.

Lucan, vi. 672.

The ancients were wild in their opinion of the hyæna; they believed that its neck consisted of one bone without any joint; that it changed its sex; imitated the human voice; had the power of charming the shepherds, and, as it were, rivetting them to the place they stood on: no wonder that an ignorant Arab should attribute preternatural powers to its remains. They are cruel, fierce, and untameable animals, of a most malevolent aspect; have a sort of obstinate courage, which will make them face stronger quadrupeds than themselves. Kæmpfer relates, that he saw one which had put two lions to flight, regarding them with the utmost coolness. Their voice is hoarse, a disagreeable mixture of growling and roaring.

Mr Pennant describes a variety of this species, undistinguished by former naturalists, which he calls the *spotted hyæna*. It has a large and flat head; some long hairs above each eye; very long whiskers on each side of the nose; a short black mane; hair on the body short and smooth; ears short and a little pointed, their outside black, inside cinereous; face and upper part of the head black; body and limbs reddish brown, marked with distinct black round spots; the hind legs with black transverse bars; the tail short, black, and full of hair. It inhabits Guinea, Ethiopia, and the Cape: lives in holes in the earth, or cliffs of the rocks; preys by night; howls horribly; breaks into the folds, and kills two or three sheep; devours as much as it can, and carries away one for a future repast; will attack mankind, scrape open graves, and devour the dead. Bosman has given this creature the name of *jackal*; by which Buffon being misled, makes it synonymous with the common jackal. This hyæna is called the *tiger-wolf* by the colonists at the Cape, where it is a very common and formidable beast of prey. Of this ani-

mal, formerly but imperfectly known, the following account is given by Dr Sparmann in his voyage to the Cape.

"The night, or the dusk of the evening only, is the time in which these animals seek their prey, after which they are used to roam about both separately and in flocks. But one of the most unfortunate properties of this creature is, that it cannot keep its own counsel. The language of it cannot easily be taken down upon paper; however, with a view to make this species of wolf better known than it has been hitherto, I shall observe, that it is by means of a sound something like the following, *aduaæ*, and sometimes *ooao*, yelled out with a tone of despair (at the interval of some minutes between each howl), that nature obliges this, the most voracious animal in all Africa, to discover itself, just as it does the most venomous of all the American serpents, by the rattle in its tail, itself, to warn every one to avoid its mortal bite. This same rattle-snake would seem, in consequence of thus betraying its own designs, and of its great inactivity (to be as it were nature's step-child), if, according to many credible accounts, it had not the wondrous property of charming its prey by fixing its eye upon it. The like is affirmed also of the tiger-wolf. This creature, it is true, is obliged to give information against itself; but, on the other hand, is actually possessed of the peculiar gift of being enabled, in some measure, to imitate the cries of other animals; by which means this arch-deceiver is sometimes lucky enough to beguile and attract calves, foals, lambs, and other animals. Near some of the larger farms, where there is a great deal of cattle, this ravenous beast is to be found almost every night; and at the same time frequently from one hour to another betraying itself by its howlings, gives the dogs the alarm. The peasants assured me, that the cunning of the wolves was so great (adding, that the trick had now and then even succeeded with some of them), that a party of them, half flying and half defending themselves, would decoy the whole pack of dogs to follow them to the distance of a gun-shot or two from the farm, with a view to give an opportunity to the rest of the wolves to come out from their ambushade, and, without meeting with the least resistance, carry off booty sufficient for themselves and their fugitive brethren. As the tiger-wolf, though a much larger and stronger animal, does not venture, without being driven to the utmost necessity, to measure its strength with the common dog, this is certainly an evident proof of its cowardice. Neither does this same voracious beast dare openly to attack oxen, cows, horses, or any of the larger animals, while they make the least appearance as if they would defend themselves, or even as long as they do not betray any signs of fear. On the other hand, it has art enough to rush in upon them suddenly and unexpectedly, at the same time setting up a horrid and strange cry, so as to set them a running in consequence of the fright, that it may afterwards keep close to their heels with safety, till it has an opportunity with one bite or stroke to rip up the belly of its prey (even though it should be so large an animal as a draught-ox), or else give it some dangerous bite, and so at one single bout make itself master of its antagonist. On this account the peasants are obliged to drive their cattle home every evening before

Canis.

Canis

it is dark, excepting the more considerable droves of draught-oxen, which they let roam about day and night to seek their food unattended, by reason that they are used both to the country and the artifices of the wolves, and can therefore the easier depend upon and defend each other.

" Travellers, on the other hand, who are obliged to keep on in their journey, frequently suffer great losses by turning their cattle out at night; especially of the young ones, which are easiest scared. The Hottentots informed me that it was still within the memory of man, that the tiger-wolf was bold enough to steal upon them and molest them in their huts, particularly by carrying off their children. This, however, is now no longer the case; a circumstance, perhaps, proceeding from the introduction of fire-arms into the country, a circumstance which, in these latter times, has caused this, as well as other wild beasts, to stand in greater awe of man than it did formerly. I have heard the following story of the tiger-wolf mentioned, as being related in a certain treatise on the Cape, of which I now cannot exactly remember the title. The tale is laughable enough, though perhaps not quite so probable. ' At a feast near the Cape one night, a trumpeter who had got his fill was carried out of doors, in order that he might cool himself, and get sober again. The scent of him soon drew thither a tiger-wolf, which threw him on his back, and dragged him along with him as a corpse, and consequently a fair prize, up towards Table-mountain. During this, however, our drunken musician waked, enough in his senses to know the danger of his situation, and to sound the alarm with his trumpet, which he carried fastened to his side. The wild beast, as may easily be supposed, was not less frightened in his turn.' Any other besides a trumpeter would, in such circumstances, have undoubtedly been no better than wolf's meat.

" In the mean while it is certain, that these wolves are to be found almost every dark night about the shambles at the Cape, where they devour the offals of bones, skin, &c. which are thrown out there in great quantities, and drag away with them what they cannot eat. The inhabitants repay these good offices of the hyæna with a free and unlimited privilege of access and egress. The dogs too hereabouts, perfectly accustomed to their company, are said never to throw any impediment in their way; so that the beast, entertained and fed in the very heart of the town, has been seldom known to do any mischief there. It is likewise a well-known fact, that these wolves, in different parts of Africa, exhibit different degrees of courage; this, however, may perhaps proceed from their being of different species in different parts.

" Yet in this very greediness of the hyæna, and its disposition to consume every thing it can get at, the provident economy of nature is abundantly evinced. The flowery fields at the Cape would certainly soon become hideous and disfigured with carcases and skeletons, the relicks of the great quantity of game of all sorts which graze and die there in succession, were not the tiger-wolf manifestly subservient to nature in the regulation of her police, by clearing her theatre from them; nay, I had almost said the wolf alone: for lions and tigers, for example, never eat bones, and are not very fond of carcases. These are serviceable in

another way. They make the other animals vigilant and attentive to the functions for which nature has designed them; and besides answering several other intentions of providence, they serve, in conjunction with mankind, to keep in a just equilibrium the increase of the animal kingdom; so that it may not exceed the supplies afforded it by the vegetable part of the creation, and by this means prevent the necessary renewal of the latter by seeds, &c. and thus, by desolating it and laying it waste, in the end impoverish and destroy themselves, and die most wretched victims to want and hunger; so that, notwithstanding the immense quantities of game existing in this country, there are very seldom found any bones in the haunts they have left, and never after the tiger, lion, jackal, wild cat, and wild dog. These latter animals, that they may not encumber and litter the ground which nature has ordained them to clear, never go out of their dens and caverns when they find themselves sick and disabled; but there, oppressed with hunger and disease, await the transitory moment, when they must pay obedience to nature's last law."

IV. The MEXICANUS has a smooth crooked tail. The Mexican. The body is ash-coloured, variegated with yellow spots. It is a native of Mexico, and is called the *mountain-cat* by Seba. It agrees with the European wolf in its manners; attacks cattle, and sometimes men.

V. The VULPES, or Fox, has a straight tail, white at the point. His body is yellowish, or rather straw-coloured; his ears are small and erect; his lips are whitish, and his forefeet black. From the base of the tail a strong scent is emitted, which to some people is very fragrant, and to others extremely disagreeable. The fox is a native of almost every quarter of the globe, and is of such a wild and savage nature that it is impossible fully to tame him. He is esteemed to be the most sagacious and the most crafty of all beasts of prey. The former quality he shows in his method of providing himself with an asylum, where he retires from pressing dangers, where he dwells, and where he brings up his young: and his craftiness is chiefly discovered by the schemes he falls upon in order to catch lambs, geese, hens, and all kinds of small birds. The fox fixes his abode on the border of the wood, in the neighbourhood of cottages: he listens to the crowing of the cocks and the cries of the poultry. He scents them at a distance; he chooses his time with judgment; he conceals his road as well as his design; he slips forward with caution, sometimes even trailing his body, and seldom makes a fruitless expedition. If he can leap the wall, or get in underneath, he ravages the court-yard, puts all to death, and then retires softly with his prey, which he either hides under the herbage, or carries off to his kennel. He returns in a few minutes for another, which he carries off, or conceals in the same manner, but in a different place. In this way he proceeds till the progress of the sun, or some movements perceived in the house, advertise him that it is time to suspend his operations, and to retire to his den. He plays the same game with the catchers of thrushes, wood-cocks, &c. He visits the nets and bird-lime very early in the morning, carries off successively the birds which are entangled, and lays them in different places, especially near the sides of high-ways, in the furrows, under the herbage or brushwood, where they sometimes lie

Canis. lie two or three days; but he knows perfectly where to find them when he is in need. He hunts the young hares in the plains, seizes old ones in their seats, never misses those which are wounded, digs out the rabbits in the warrens, discovers the nests of partridges and quails, seizes the mothers on the eggs, and destroys a vast quantity of game. The fox is exceedingly voracious; besides flesh of all kinds, he eats, with equal avidity, eggs, milk, cheese, fruits, and particularly grapes. When the young hares and partridges fail him, he makes war against rats, field-mice, serpents, lizards, toads, &c. Of these he destroys vast numbers; and this is the only service he does to mankind. He is so fond of honey, that he attacks the wild bees, wasps, and hornets. They at first put him to flight by a thousand stings; but he retires only for the purpose of rolling himself on the ground to crush them; and he returns so often to the charge, that he obliges them to abandon the hive, which he soon uncovers, and devours both the honey and wax. In a word, he eats fishes, lobsters, grass-hoppers, &c.

The fox is not easily, and never fully tamed: he languishes when deprived of liberty; and, if kept too long in a domestic state, he dies of chagrin. Foxes produce but once a year; and the litter commonly consist of four or five, seldom six, and never less than three. When the female is full, she retires, and seldom goes out of her hole, where she prepares a bed for her young. She comes in season in the winter; and young foxes are found in the month of April. When she perceives that her retreat is discovered, and that her young have been disturbed, she carries them off one by one, and goes in search of another habitation. The young are brought forth blind; like the dogs, they grow 18 months, or two years, and live 13 or 14 years.—The fox, as well as the congenerous wolf, will produce with the dog-kind, as noticed above.

The senses of the fox are equally good as those of the wolf; his sentiment is more delicate; and the organs of his voice are more pliant and perfect. The wolf sends forth only frightful howlings; but the fox barks, yelps, and utters a mournful cry like that of the peacock. He varies his tones according to the different sentiments with which he is affected: he has an accent peculiar to the chase, the tone of desire, of complaint, and of sorrow. He has another cry expressive of acute pain, which he utters only when he is shot, or has some of his members broken; for he never complains of any other wound, and, like the wolf, allows himself to be killed with a bludgeon without complaining; but he always defends himself to the last with great courage and bravery. His bite is obstinate and dangerous; and the severest blows will hardly make him quit his hold. His yelping is a species of barking, and consists of a quick succession of similar tones; at the end of which he generally raises his voice similar to the cry of the peacock. In winter, and particularly during frost and snow, he yelps perpetually; but, in summer, he is almost entirely silent, and, during this season, he casts his hair. He sleeps sound, and may be easily approached without wakening: he sleeps in a round form, like the dog; but, when he only reposes himself, he extends his hind legs, and lies on his belly. It is in this situation that he spies the birds along the hedges, and meditates schemes for their surprise. The

fox flies when he hears the explosion of a gun, or smells gun powder. He is exceedingly fond of grapes, and does much mischief in vineyards. Various methods are daily employed to destroy foxes: they are hunted with dogs; iron traps are frequently set at their holes; and their holes are sometimes smoked to make them run out, that they may the more readily fall into the snares, or be killed by dogs or fire-arms.

The chase of the fox requires less apparatus, and is more amusing, than that of the wolf. To the latter every dog has great reluctance: but all dogs hunt the fox spontaneously and with pleasure; for, though his odour be strong, they often prefer him to the stag or the hare. He may be hunted with terriers, hounds, &c. Whenever he finds himself pursued, he runs to his hole; the terriers with crooked legs, or turnspits, go in with most ease. This mode answers very well when we want to carry off a whole litter of foxes, both mother and young. While the mother defends herself against the terriers, the hunters remove the earth above, and either kill or seize her alive. But, as the holes are often under rocks, the roots of trees, or sunk too deep in the ground, this method is frequently unsuccessful. The most certain and most common method of hunting foxes, is to begin with shutting up their holes, to place a man with a gun near the entrance, and then to search about with the dogs. When they fall in with him, he immediately makes for his hole; but, when he comes up to it, he is met with a discharge from the gun. If he escapes the shot, he runs with full speed, takes a large circuit, and returns again to the hole, where he is fired upon a second time; but, finding the entrance shut, he now endeavours to escape by darting straight forward, with the design of never revisiting his former habitation. He is then pursued by the hounds, whom he seldom fails to fatigue, because he purposely passes through the thickest parts of the forest or places of the most difficult access, where the dogs are hardly able to follow him; and, when he takes to the plains, he runs straight out, without stopping or doubling.

Of all animals the fox has the most significant eye, by which it expresses every passion of love, fear, hatred, &c. It is remarkably playful; but, like all savage creatures half reclaimed, will on the least offence bite those it is most familiar with. It is a great admirer of its bushy tail, with which it frequently amuses and exercises itself, by running in circles to catch it: and, in cold weather, wraps it round its nose. The smell of this animal is in general very strong, but that of the urine is remarkably fetid. This seems so offensive even to itself, that it will take the trouble of digging a hole in the ground, stretching its body at full length over it; and there, after depositing its water, cover it over with the earth, as the cat does its dung. The smell is so obnoxious, that it has often proved the means of the fox's escape from the dogs; who have so strong an aversion at the filthy effluvia, as to avoid encountering the animal it came from. It is said that the fox makes use of its urine as an expedient to force the cleanly badger from its habitation: whether that is the means, is rather doubtful; but that the fox makes use of the badger's hole is certain: not through want of ability to form its own retreat, but to save itself some trouble; for after the ex-

pulsion

Canis.

pulsion of the first inhabitant, the fox improves as well as enlarges it considerably, adding several chambers, and providently making several entrances to secure a retreat from every quarter. In warm weather, it will quit its habitation for the sake of basking in the sun, or to enjoy the free air; but then it rarely lies exposed, but chooses some thick brake, that it may rest secure from surprize. Crows, magpies, and other birds, who consider the fox as their common enemy, will often, by their notes of anger, point out its retreat.—The skin of this animal is furnished with a warm soft fur, which in many parts of Europe is used to make muffs and to line clothes. Vast numbers are taken in Le Val-lais, and the Alpine parts of Switzerland. At Lau-fanne there are furriers who are in possession of between 2000 and 3000 skins, all taken in one winter.

Of the fox there are several varieties, derived from colour; as,

1. The field-fox, or *alopex* of Linnæus, who makes it a distinct species; but it is every way the same with the common fox, except in the point of the tail, which is black.

2. The cross-fox, with a black mark passing transversely from shoulder to shoulder, with another along the back to the tail. It inhabits the coldest parts of Europe, Asia, and North-America: a valuable fur, thicker and softer than the common sort; great numbers of the skins are imported from Canada.

3. The black fox is the most cunning of any, and its skin the most valuable; a lining of it is, in Russia, esteemed preferable to the finest fables: a single skin will sell for 400 rubles. It inhabits the northern parts of Asia and North-America. The last is inferior in goodness.

4. The brant fox, as described by Gesner and Linnæus, is of a fiery redness; and called by the first *brand-fuchs*, by the last *brandraef*; it is scarce half the size of the common fox: the nose is black, and much sharper; the space round the ears ferruginous; the forehead, back, shoulders, thighs, and sides black mixed with red, ash-colour, and black; the belly yellowish; the tail black above, red beneath, and cinereous on its side. It is a native of Pennsylvania.

5. The corsac-fox, with upright ears, soft downy hair; tail bushy; colour in summer pale tawney, in winter grey: the base and tip of the tail black; a small kind. It inhabits the deserts beyond the Yaik: lives in holes: howls and barks: is caught by the Kirgis Cassacks with falcons and gre-hounds; 40 or 50,000 are annually taken, and sold to the Russians, at the rate of 40 kopeiks, or 20 pence, each: the former use their skins instead of money: great numbers are sent into Turkey.

6. There are three varieties of foxes found in the mountainous parts of Britain, which differ a little in form, but not in colour, from each other. They are distinguished in Wales by as many different names. The *milgi*, or *gre-hound-fox*, is the largest, tallest, and boldest; and will attack a grown sheep or wedder: the *mastiff-fox* is less, but more strongly built: the *corgi*, or *cur-fox* is the least; lurks about hedges, out-houses, &c. and is the most pernicious of the three to the feathered tribe. The first of these varieties has a white tag or tip to the tail; the last a black. When hunted, they never run directly forward, but make a great ma-

ny doublings and turnings; and when in danger of being taken, they emit such a smell from their posteriors that the hunters can hardly endure it.

VI. The *LAGOPUS*, or arctic fox, with a sharp nose; short rounded ears, almost hid in the fur; long and soft hair, somewhat woolly; short legs; toes covered on all parts, like that of a common hare, with fur; tail shorter and more bushy than that of the common fox, of a bluish grey or ash colour, sometimes white: the young of the grey are black before they come to maturity: the hair much longer in winter than summer, as is usual with animals of cold climates. It inhabits the countries bordering on the Frozen Sea; Khamtschatka, the isles between it and America, and the opposite parts of America discovered in captain Bering's expedition, 1741; is again found in Greenland, Iceland, Spitzbergen, Nova Zembla, and Lapland. It burrows underground, forms holes many feet in length, and strews the bottom with moss. In Greenland and Spitzbergen it lives in the cliffs of rocks, not being able to burrow, by reason of the frost: two or three pair inhabit the same hole. They are in heat about Lady-day; and during that time, they continue in the open air, but afterwards take to their holes. They go with young nine weeks: like dogs, they continue united in copulation: they bark like that animal, for which reason the Russians call them *peszti*, or dogs. They have all the cunning of the common fox; prey on geese, ducks, and other water-fowl, before they can fly; on grouse of the country, on hares, and the eggs of birds; and in Greenland (through necessity) on berries, shell-fish, or any thing the sea flings up. But their principal food in the north of Asia and in Lapland is the leming, or Lapland marmot: those of the countries last mentioned are very migratory, pursuing the leming which is a wandering animal: sometimes these foxes will desert the country for three or four years, probably in pursuit of their prey; for it is well known that the migrations of the leming are very inconstant, it appearing in some countries only once in several years. The people of Jenessea suspect they go to the banks or the Oby. Their chief rendezvous is on the banks of the Frozen Sea, and the rivers that flow into it, where they are found in great troops. The Greenlanders take them either in pitfalls dug in the snow, and baited with the capelin fish; or in springs made with whalebone, laid over a hole made in the snow, strewed over at bottom with the same kind of fish; or in traps made like little huts, with flat stones, with a broad one by way of door, which falls down (by means of a string baited on the inside with a piece of flesh) whenever the fox enters and pulls at it. The Greenlanders preserve the skins for traffic; and in cases of necessity eat the flesh. They also make buttons of the skins; and split the tendons, and make use of them instead of thread. The blue furs are much more esteemed than the white.

VII. The *INDICA*, or antarctic fox (the *coyotl* of Fernandez, the *loup-renard* of Bougainville), has pointed ears; irides hazel; head and body cinereous brown; hair more woolly than that of the common fox, resembling much that of the arctic; legs dashed with rust-colour; tail dusky, tipped with white; shorter and more bushy than that of the common fox, to which it is about one-third superior in size. It has much the habit of the wolf, in ears, tail, and strength of limbs.

The

Canis.

The antarctic Fox.

Canis.

The French therefore call it *loup-renard*, or wolf-fox. It may be a wolf degenerated by climate. The largest are those of Senegal: the next are the European: those of North America are still smaller. The Mexican wolves, which Mr Pennant apprehends to be this species, are again less; and this, which inhabits the Falkland isles, near the extremity of South America, is dwindled to the size described. This is the only land animal of those distant isles: it has a fetid smell, and barks like a dog. It lives near the shores; kennels like a fox; and forms regular paths from bay to bay, probably for the convenience of surprizing the waterfowl, on which it lives. It is at times very meagre, from want of prey; and is extremely tame. The islands were probably stocked with those animals by means of masses of ice broken from the continent, and carried by the currents.

The grey-fox of Catesby.

VIII. The GREY-FOX of Catesby, &c. has a sharp nose; sharp, long, upright ears; legs long; colour grey, except a little redness about the ears.—It inhabits Carolina, and the warmer parts of North America: It differs from the arctic fox in form, and the nature of its dwelling; agrees with the common fox in the first, varies from it in the last: It never burrows, but lives in hollow trees; it gives no diversion to the sportsman; for after a mile's chase, it takes to its retreat; it has no strong smell; it feeds on poultry, birds, &c. These foxes are easily made tame; their skins, when in season, made use of for muffs.

The silver Fox of Louisiana.

IX. The SILVER FOX of Louisiana. It resembles the common fox in form, but has a most beautiful coat. The short hairs are of a deep brown; and over them spring long silvery hairs, which give the animal a very elegant appearance. They live in forests abounding in game, and never attempt the poultry which run at large. The woody eminences in Louisiana are every where pierced with their holes.

The Barbary Fox.

X. The BARBARY FOX, (*le Chacal*, Buff.), or jackal-adive, has a long and slender nose, sharp upright ears, long bushy tail: colour, a very pale brown; space above and below the eyes, black; from behind each ear, there is a black line, which soon divides into two, which extend to the lower part of the neck; and the tail is surrounded with three broad rings. This species is of the size of the common fox, but the limbs are shorter, and the nose is more slender.—Mr. de Buffon informs us, that Mr Bruce told him this animal was common in Barbary, where it was called *thaleb*. But Mr Pennant observes, that Mr Bruce should have given it a more distinguishing name; for *thaleb*, or *taaleb*, is no more than the Arabic name for the common fox, which is also frequent in that country.

The Jackal.

XI. The AUREUS, Schakal, or Jackal, as described by Mr Pennant, has yellowish brown irides; ears erect, formed like those of a fox, but shorter and less pointed: hairy and white within; brown without, tinged with dusky: head shorter than that of a fox, and nose blunter: lips black, and somewhat loose: neck and body very much resembling those of that animal, but the body more compressed: the legs have the same resemblance, but are longer: tail thickest in the middle, tapering to the point: five toes on the fore feet; the inner toe very short, and placed high: four toes on the hind feet; all are covered with hair even to the claws. The hairs are much stiffer than those of a fox, but scarcely

so stiff as those of a wolf; short about the nose; on the back, three inches long; on the belly shorter. Those at the end of the tail four inches long. Colour of the upper part of the body a dirty tawny; on the back, mixed with black: lower part of the body of a yellowish white: tail tipped with black; the rest of the same colour with the back: the legs of an unmixed tawny brown; the fore legs marked (but not always) with a black spot on the knees; but on no part are those vivid colours which could merit the title of *golden*, bestowed on it by Kæmpfer.—The length of this animal from the nose to the root of the tail is little more than twenty-nine inches English: the tail, to the ends of the hairs, ten three quarters; the tip reaching to the top of the hind legs: the height, from the space between the shoulders to the ground, rather more than eighteen inches and a half; the hind parts a little higher.—This species inhabits all the hot and temperate parts of Asia, India, Persia, Arabia, Great Tartary, and about Mount Caucasus, Syria, and the Holyland. It is found in most parts of Africa, from Barbary to the Cape of Good Hope.

Professor Gueldenstaedt*, the able describer of this long-lost animal, remarks, that the cæcum entirely agrees in form with that of a dog, and differs from that of the wolf and fox. And Mr Pennant observes, that there is the same agreement in the teeth with those of a dog; and the same variation in them from those of the two other animals. These circumstances strengthen the opinion entertained by some writers, that the dogs of the old world did derive their origin from one or other of them. The jackals have indeed so much the nature of dogs, as to give reasonable cause to imagine that they are at least the *chief* stock from which is sprung the various races of those domestic animals. When taken young, they grow instantly tame; attach themselves to mankind; wag their tails; love to be stroked; distinguish their masters from others; will come on being called by the name given to them; will leap on the table, being encouraged to it: they drink, lapping; and make water sideways, with their leg held up. Their dung is hard: *odorat anum alterius, coheret copula junctus*. When they see dogs, instead of flying, they seek them, and play with them. They will eat bread eagerly; notwithstanding they are in a wild state carnivorous. They have a great resemblance to some of the Calmuc dogs, which perhaps were but a few descents removed from the wild kinds. Our dogs are probably derived from those reclaimed in the first ages of the world; altered by numberless accidents into the many varieties which now appear among us.

The wild schakals go in packs of 40, 50, and even two hundred, and hunt like hounds in full cry from evening to morning. They destroy flocks and poultry, but in a less degree than the wolf or fox: ravage the streets of villages and gardens near towns, and will even destroy children, if left unprotected. They will enter stables and outhouses, and devour skins, or any thing made of that material. They will familiarly enter a tent, and steal whatsoever they can find from the sleeping traveller. In default of living prey, they will feed on roots and fruits; and even on the most infected carrion: they will greedily disinter the dead, and devour the putrid carcases; for which reason, in many countries the graves are made of a great depth. They at-

Canis.

tend.

Canis.

tend caravans, and follow armies, in hopes that death will provide them a banquet.

Their voice naturally is a howl. Barking, Mr Pennant observes, is latently inherent; and in their state of nature seldom exerted: but its different modifications are adventitious, and expressive of the new passions and affections gained by a domestic state. Their howlings and clamours in the night are dreadful, and so loud that people can scarcely hear one another speak. Dellon says, their voice is like the cries of a great many children of different ages mixed together: when one begins to howl, the whole pack join in the cry. Kämpfer says, that every now and then a sort of bark is intermixed; which confirms what is above asserted by Mr Pennant. Dellon agrees in the account of their being tamed, and entertained as domestic animals. During day they are silent. They dig burrows in the earth, in which they lie all day, and come out at night to range for prey: they hunt by the nose, and are very quick of scent. The females breed only once a year; and go with young only four weeks; they bring from six to eight at a time. Both Mr Gueldenaedt and Mr Bell contradict the opinion of their being very fierce animals.

This animal is vulgarly called the *Lion's Provider*, from an opinion that it rouses the prey for that bad-nosed quadruped. The fact is, every creature in the forest is set in motion by the fearful cries of the jackals; the lion, and other beasts of rapine, by a sort of instinct, attend to the chase, and seize such timid animals as betake themselves to flight at the noise of this nightly pack. The jackal is described by Oppian, under the name of *Λυξ* *ἡ ὄρεος*, or *yellow wolf*; who mentions its horrible howl. It may, as M. de Buffon conjectures, be the *ἄλς* of Aristotle, who mentions it with the wolf, and says that it has the same internal structure as the wolf, which is common with congenerous animals. The Thoes of Pliny may also be a variety of the same animal; for his account of it agrees with the modern history of the schakal, except in the last article: "Thoes, Luporum id genus est procerius longitudine, brevitae crurum dissimile, velox saltu, venatu vivens, innocuum homini;" lib. viii. c. 34.

The Mesomelas.

XII. The MESOMELAS, or *Capefch* of Schreber, the *tenlie* or *kenlie* of the Hotentots, has erect yellowish brown ears, mixed with a few scattered black hairs: the head is of a yellowish brown, mixed with black and white, growing darker towards the hind part: the sides are of a light brown, varied with dusky hairs: the body and also the back part of the legs are of a yellowish brown, lightest on the body; the throat, breast, and belly white. On the neck, shoulders, and back, is a bed of black; broad on the shoulders, and growing narrower to the tail: when the hairs are smooth, the part on the neck seems barred with white; that on the shoulders with white conoid marks, one within the other, the end pointing to the back: when the hairs are ruffled, these marks vanish, or grow less distinct, and a hoariness appears in their stead. The tail is bushy, of a yellowish brown; marked on the upper part with a longitudinal stripe of black, and towards the end encircled with two rings of black, and is tipped with white. In length, the animal is two feet three quarters, to the origin of the tail: the tail is one foot. This species inhabits the countries about the Cape

No 63.

of Good Hope, and probably is found as high as the line.

XIII. The THOUS has a smooth crooked tail; the upper part of its body is grey, and its belly white. It is about the size of a large cat; and, according to Linnæus, is found at Surinam; it is mentioned by no other naturalist.

XIV. The ZERDA. This animal has a very pointed visage; large bright black eyes; very large ears, of a bright rose-colour, internally lined with long hairs; the orifice so small as not to be visible, probably covered with a valve or membrane: the legs and feet are like those of a dog; the tail is taper: colour between a straw and pale brown. Length from nose to tail, ten inches; ears, three inches and a half long; tail, six: height, not five. It inhabits the vast desert of Saara, which extends beyond mount Atlas: It burrows in the sandy ground, which shows the necessity of the valves to the ears; and is so excessively swift, that it is very rarely taken alive. It feeds on insects, especially locusts: sits on its rump: is very vigilant: barks like a dog, but much shriller, and that chiefly in the night: never is observed to be sportive. We are indebted to Mr Eric Skioldebrand, the late Swedish consul at Algiers, for our knowledge of this singular animal. He never could procure but one alive, which escaped before he examined its teeth: the genus is very uncertain: the form of its head and legs, and some of its manners, determined Mr Pennant to rank it in this genus. That which was in possession of Mr Skioldebrand fed freely from the hand, and would eat bread or boiled meat. Buffon has given a figure of this animal; but from the authority of Mr Bruce ascribes to it a different place, and different manners. He says that it is found to the south of the Palus Tritonides, in Libya; that it has something of the nature of the hare, and something of the squirrel; and that it lives on the palm-trees, and feeds on the fruits.

CANIS Major, the great dog in astronomy, a constellation of the southern hemisphere, below Orion's feet, though somewhat to the westward of him; whose stars Ptolemy makes 29; Tycho observed only 13; Hevelius 21; in the Britannic catalogue they are 31.

CANIS Minor, the little dog, in astronomy, a constellation of the northern hemisphere; called also by the Greeks, *Procyon*, and by the Latins *Antecanis* and *Canicula*. The stars in the constellation canis minor, are in Ptolemy's catalogue 2; in Tycho's, 5; in Hevelius's, 13; and in the British catalogue, 14.

CANISIUS (Henry), a native of Nimeguen, and one of the most learned men of his time, was professor of canon law at Ingolstadt; and wrote a great number of books; the principal of which are, 1. *Summa Juris Canonici*. 2. *Antique lectiones*, a very valuable work. He died in 1609.

CANITZ (the baron of), a German poet and statesman, was of an ancient and illustrious family in Brandenburg, and born at Berlin in 1564, five months after his father's death. After his early studies, he travelled to France, Italy, Holland, and England; and upon his return to his country, was charged with important negotiations by Frederic II. Frederic III. employed him also. Canitz united the statesman with the poet; and was conversant in many languages, dead

as well as living. His German poems were published for the tenth time, 1750, in 8vo. He is said to have taken Horace for his model, and to have written purely and delicately. But he did not content himself with barely cultivating the fine arts in himself; he gave all the encouragement he could to them in others. He died at Berlin, in 1699, privy counsellor of state, aged 45.

CANKER, a disease incident to trees, proceeding chiefly from the nature of the soil. It makes the bark rot and fall. If the canker be in a bough, cut it off; in a large bough, at some distance from the stem; in a small one, close to it: but for over-hot strong ground, the ground is to be cooled about the roots with pond-mud and cow-dung.

CANKER, among farriers. See **FARRIERY**, § xlv. 2.

CANNA, in botany: A genus of the monogynia order, belonging to the monandria class of plants; and in the natural method ranking under the eighth order, *Scitamineæ*. The corolla is erect, and divided into six parts, with a distinct lip bipartite and rolled back; the style lanceolate, and growing to the corolla; the calyx is triphyllous.

Species. 1. The indica, or common broad-leaved flowering cane, is a native of both Indies; the inhabitants of the British islands in America call it *Indian shot*, from the roundness and hardness of the seeds. It hath a thick, fleshy, tuberous root, which divides into many irregular knobs; it sends out many large oval leaves, without order. At their first appearance the leaves are like a twisted horn; but afterwards expand, and are near a foot long, and five inches broad in the middle; lessening gradually to both ends, and terminated in a point. The stalks are herbaceous, rising four feet high, and are encompassed by the broad leafy foot-stalks of the leaves; at the upper part of the stalk the flowers are produced in loose spikes, each being at first covered with a leafy hood, and turns to a brown colour. The flowers are succeeded by a fruit or capsule, oblong, rough, and crowned with the three-cornered empalement of the flower which remains. When the fruit is ripe, the capsule opens lengthwise into three cells, filled with round, shining, hard, and black seeds. 2. The latifolia, with a pale red flower, is a native of Carolina, and some other northern provinces of America. 3. The glauca, with a very large flower, is a native of South America. 4. The lutea, with obtuse oval leaves, is less common in America than the other sorts. 5. The coccinea, hath larger leaves than any of the other species, and the stalks rise much higher. The flowers are produced in large spikes; and are of a bright crimson, or rather scarlet colour.

Culture. These plants must always be kept in pots of rich earth, to be moved to shelter in winter. They are propagated by seeds sown on a hot-bed, in the spring; and in summer, when the plants are a little advanced in growth, prick them separately in small pots of rich earth, plunging them also in the hot-bed, giving shade, water, and fresh air; to which last harden them by degrees, till they bear it fully. In October they must be removed into a very good stove or green house.

CANNABIS, in botany: A genus of the pentandria order, belonging to the dioecia class of plants; and in the natural method ranking under the 53d or

der, *Scabridæ*. The calyx of the male is quinquepartite, with no corolla. In the female the calyx is monophyllous, entire, and gaping at the side; there is no corolla, but two styles; the fruit is a nut, bivalved, within the closed calyx. Of this there is but one species, viz. the sativa. This is propagated in the rich fenny parts of Lincolnshire in great quantities, for its bark, which is useful for cordage, cloth, &c. and the seeds abound with oil. Hemp is always sown on a deep, moist, rich, soil, such as is found in Holland, Lincolnshire, the fens of the island of Ely, where it is cultivated to great advantage, as it might be in many other parts of England where there is a soil of the same kind; but it will not thrive on clayey or stiff cold land. The ground on which hemp is designed to be sown, should be well ploughed, and made very fine by harrowing. About the middle of April the seed may be sown; three bushels is the usual allowance for an acre, but two are sufficient. In the choice of the seed, the heaviest and brightest coloured should be preferred; and particular care should be had to the kernel of the seed. For the greater certainty in this matter, some of the seeds should be cracked, to see whether they have the germ or future plant perfect: for, in some places, the male plants are drawn out too soon from the female, i. e. before they have impregnated the female plants with the farina; in which case, though the seeds produced by these females may seem fair to the eye, yet they will not grow*, according to the doctrine of Linnæus. When the plants are come up, they should be hoed out in the same manner as is practised for turnips, leaving them two feet apart; observe also to cut down all the weeds, which, if well performed, and in dry weather, will destroy them. This crop, however, will require a second hoeing, in about six weeks after the first; and, if this is well performed, the crop will require no further care. The first season for pulling hemp is usually about the middle of August, when they begin to pull what they call the *finble hemp*, being that which is composed of the male plants; but it would be the much better method to defer this for a fortnight or three weeks longer, until those male plants have fully shed their farina or dust, without which the seeds will prove only empty husks. These male plants decay soon after they have shed their farina. The second pulling is a little after Michaelmas, when the seeds are ripe. This is usually called *karle hemp*, and consists of the female plants which were left. This karle hemp is bound in bundles of a yard compass, according to statute measure, which are laid in the sun for a few days to dry; and then it is stacked up, or housed, to keep it dry till the seed can be threshed out. An acre of hemp, on a rich soil, will produce near three quarters of seed, which, together with the unwrought hemp, is worth from six to eight pounds. Hemp is esteemed very effectual for destroying weeds: but this it accomplishes by impoverishing the ground, and thus robbing them of their nourishment; so that a crop of it must not be repeated on the same spot.

Some seeds of a large kind of hemp growing in China were lately sent by the East India Company to the Society for the encouragement of Arts, Manufactures, and Commerce, who distributed them to the members and other gentlemen who appeared likely to cultivate them; and from experiments made in conse-

Cannabis,
Cannæ.

quence, the plant has been found to succeed perfectly in this climate. The first trials were rather unpromising, the hemp produced from the foreign seeds proving of very little value. But the Reverend Dr Hinton of Northwold, who made the above trial in 1786, having accidentally saved some ripe seeds of that crop, sowed them in May 1787 on a spot of good land. They came up well, and attained as much perfection as ordinary hemp. The produce, when dressed, weighed at the rate of 95 stone 7 pounds and 12 ounces per acre, (being above 30 stone more, he says, than the usual crops of hemp in that neighbourhood); and at the rate of three bushels two pecks and half a pint of seed per acre were saved. Dr Hinton supposes that the seeds brought from China failed principally, if not entirely, by having been two years old, at which age hempseed seldom vegetates. Now that it is found to ripen with us, fresh seeds can always be obtained. It will yet, however, require a few years to determine whether this species will continue to retain its great size, or will degenerate and become the common hemp of Europe.

From the leaves of hemp pounded and boiled in water, the natives of the East Indies prepare an intoxicating liquor of which they are very fond. The plant, when fresh, has a rank narcotic smell; the water in which the stalks are soaked, in order to separate the tough rind for mechanic uses, is said to be violently poisonous, and to produce its effects almost as soon as drunk. The seeds also have some smell of the herb, and their taste is unctuous and sweetish: they are recommended, boiled in milk, or triturated with water into an emulsion, against coughs, heat of urine, and the like. They are also said to be useful in incontinence of urine, and for restraining venereal appetites; but experience does not warrant their having any virtues of that kind.

CANNÆ, (anc. geog.) a town of Apulia in the Adriatic, at the mouth of the river Aufidus, rendered famous by a terrible overthrow which the Romans here received from the Carthaginians under Hannibal. The Roman consuls Æmilius Paulus and Terentius Varro, being authorized by the senate to quit the defensive plan, and stake the fortunes of the republic on the chance of a battle, marched from Canusium, and encamped a few miles east, in two unequal divisions, with the Aufidus between them. In this position they meant to wait for an opportunity of engaging to advantage; but Hannibal, whose critical situation in a desolated country, without refuge or allies, could admit of no delay, found means to inflame the vanity of Varro by some trivial advantages in skirmishes between the light horse. The Roman, elated with this success, determined to bring matters to a speedy conclusion; but, finding the ground on the south side too confined for the operations of so large an army, crossed the river; and Varro, resting his right wing upon the Aufidus, drew out his forces in the plain. Hannibal, whose head quarters were at Cannæ, no sooner perceived the enemy in motion, than he forded the water below, and marshalled his troops in a line opposite to that of his adversaries.

The Romans were vastly superior in number to the Carthaginians; but the latter were superior in cavalry. The army of the former, consisting of 87,000 men, was drawn up in the usual manner; the *hastati* in the

first line, the *principes* in the second, and the *triarii* in the third. The cavalry were posted on the wings. On the right, the Roman knights flanked the legionaries; in the left, the cavalry of the allies covered their own infantry. The two consuls commanded the two wings, Æmilius the right, and Terentius the left; and the two proconsuls Servilius and Attilius the main body. On the other hand, Hannibal, whose army consisted of 40,000 foot and 10,000 horse, placed his Gaulish and Spanish cavalry in his left wing, to face the Roman knights; and the Numidian horse in his right, over against the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he posted near the Gaulish and Spanish horse, the other near the Numidian. Between these two bodies were placed on one side the Gaulish, on the other the Spanish infantry, drawn up in such a manner as to form an obtuse angle projecting a considerable way beyond the two wings. Behind this line he drew up a second which had no projection. Asdrubal commanded the left wing; Maherbal the right; and Hannibal himself, with his brother Mago, the main body. He had also taken care to post himself in such a manner that the wind *Vulturnus*, which rises at certain stated times, should blow directly in the faces of the Romans during the fight, and cover them with dust. The onset was begun by the light-armed infantry; the Romans discharging their javelins, and the *baleares* their stones, with pretty equal success; nevertheless, the consul Æmilius was wounded. Then the Roman cavalry in the right wing advanced against the Gaulish and Spanish in Hannibal's left. As they were shut in by the river Aufidus on one side, and by their infantry on the other, they did not fight, as usual, by charging and wheeling off, and then returning to the charge; but continued fighting each man against his adversary, till one of them was killed or retired. After they had made prodigious efforts on both sides to overbear each other, they all on a sudden dismounted, and fought on foot with great fury. In this attack the Gauls and Spaniards soon prevailed; put the Romans to the rout; and, pursuing them along the river, strewed the ground with their dead bodies, Asdrubal giving no quarter. This action was scarce over, when the infantry on both sides advanced. The Romans first fell upon the Spaniards and Gauls, who, as already observed, formed a kind of triangle projecting beyond the two wings. These gave ground, and, pursuant to Hannibal's directions, sunk into the void space in their rear; by which means they insensibly brought the Romans into the centre of the African infantry, and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans, being by this artful retreat drawn into the snare and surrounded, no longer kept their ranks, but formed several platoons in order to face every way. Æmilius, who was on the right wing, seeing the danger of the main body, at the head of his legionaries acted the part both of a soldier and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left, attended the brave consul on foot; and, encouraged by his example, fought like men in despair. But, in the mean time, Asdrubal, at the head of a detachment of Gaulish and Spanish

Cannæ.

Spanish

Cannæ.

Spanish infantry brought from the centre, attacked Æmilius's legionaries with such fury, that they were forced to give ground and fly: the consul being all covered with wounds, was at last killed by some of the enemy who did not know him. In the main body, the Romans, though invested on all sides, continued to sell their lives dear; fighting in platoons, and making a great slaughter of the enemy. But being at length overpowered, and disheartened by the death of the two proconsuls Servilius and Attilius who headed them, they dispersed and fled, some to the right, and others to the left, as they could find opportunity; but the Numidian horse cut most of them in pieces: the whole plain was covered with heaps of dead bodies, insomuch that Hannibal himself, thinking the butchery too terrible, ordered his men to put a stop to it.—There is a great disagreement among authors as to the number of Romans killed and taken at the battle of Cannæ. According to Livy, the republic lost 50,000 men, including the auxiliaries. According to Polybius, of 6000 Roman horse, only 70 escaped to Venusia with Terentius Varro and 300 of the auxiliary horse. As to the infantry, that writer tells us, that 70,000 of the Roman foot died on the field of battle fighting like brave men; and that 13,000 were made prisoners. According to Dionysius of Halicarnassus, of 6000 horse, only 370 escaped the general slaughter, and of 80,000 foot, 3000 only were left. The most moderate computation makes the number of Romans killed to amount to 45,000. The scene of action is marked out to posterity, by the name of *Pezzo di Sangue*, "Field of Blood."

These plains have more than once, since the Punic war, afforded room for men to accomplish their mutual destruction. Melo of Bari, after raising the standard of revolt against the Greek emperors, and defeating their generals in several engagements, was at last routed here in 1019, by the Catapan Boianus. Out of two hundred and fifty Norman adventurers, the flower of Melo's army, only ten escaped the slaughter of the day. In 1201, the archbishop of Palermo and his rebellious associates, who had taken advantage of the nonage of Frederic of Swabia, were cut to pieces at Cannæ by Walter de Brienne, sent by the pope to defend the young king's dominions.

The traces of the town of Cannæ are very faint, consisting of fragments of altars, cornices, gates, walls, vaults, and under-ground granaries. It was destroyed the year before the battle; but being rebuilt, became an episcopal see in the infancy of Christianity. It was again ruined in the sixth century, but seems to have subsisted in an humble state many ages later; for we read of its contending with Barletta for the territory, which till then had been enjoyed in common by them; and in 1284, Charles I. issued an edict for dividing the lands, to prevent all future litigation. The prosperity of the towns along the coast, which increased in wealth and population by embarkations for the Crusades and by traffic, proved the annihilation of the great inland cities; and Cannæ was probably abandoned entirely before the end of the thirteenth century.

CANNEQUINS, in commerce, white cotton cloths brought from the East Indies. They are a proper commodity for trading on the coast of Guinea, particularly about the rivers Senega and Gambia. These

linens are folded square-wise, and are about eight ells long.

CANNEL COAL. See AMPELITES.

CANNES, a town of France, in Provence, and in the viguerie of Grasse, seated on the coast of the Mediterranean sea, with a harbour and a castle. E. Long, 7. 7. N. Lat. 43. 34.

CANNIBAL, a modern term for an anthropophagus or man-eater, more especially in the West Indies. See ANTHROPOPHAGI.

CANNON, a military engine for throwing balls, &c. by the help of GUNPOWDER.

The invention of brass cannon is by Laney ascribed to J. Owen: he says, that they were first known in England in the year 1535; but yet acknowledges, that, in 1346, there were four pieces of cannon in the English army at the battle of Cressy, and that these were the first that were known in France. And Mézeray relates, that king Edward, by five or six pieces of cannon, struck terror into the French army, it being the first time they had seen any of these thundering machines; though others affirm that cannon were known also in France at the same time; but that the French king, in his hurry to attack the English, and in confidence of victory, left all his cannon behind him as useless incumbrances (See ARTILLERY). The Germans carry the invention farther back, and attribute it to Albertus Magnus, a Dominican monk, about the year 1250. Vossius rejects all these opinions, and finds cannon in China almost 1700 years ago. According to him, they were mounted by the emperor Kitey in the year of Christ 85. For further particulars of their history, &c. see GUN and GUNNERY.

For the casting of cannon, see FOUNDERY. For their different parts, proportions, management, operation, and effects, see GUNNERY.

CANNON, with letter-founders and printers, the name of the largest size of letters they use.

CANNONADE, the application of artillery to the purposes of war, or the direction of its efforts against some distant object intended to be seized or destroyed, as a ship, battery, or fortress. See GUNNERY.

Since a large ship of war may be considered as a combination of floating batteries, it is evident that the efforts of her artillery must be greatly superior to those of a fortress on the sea-coast; that is to say, in general; because, on some particular occasions, her situation may be extremely dangerous, and her cannonading ineffectual. Her superiority consists in several circumstances, as the power of bringing her different batteries to converge to one point; of shifting the line of her attack so as to do the greatest possible execution against the enemy, or to lie where she will be the least exposed to his shot; and chiefly because, by employing a much greater number of cannon against a fort than it can possibly return, the impression of her artillery against stone-walls soon becomes decisive and irresistible. Besides these advantages in the attack, she is also greatly superior in point of defence: because the cannon-shot, passing with rapidity through her sides, seldom do any execution out of the line of their flight, or occasion much mischief by their splinters; whereas they very soon shatter and destroy the faces of a parapet, and produce incredible havoc among the men by the fragments of the stones, &c. A ship may also re-

Cannel
Coal
||
Cannonade

Cannula
||
Canoe.

treat when she finds it too dangerous to remain longer exposed to the enemy's fire, or when her own fire cannot produce the desired effect. Finally, the fluctuating situation of a ship, and of the element on which she rests, renders the effects of bombs very uncertain, and altogether destroys the effect of the *ricochet*, or rolling and bounding shot, which is so pernicious and destructive in a fortress or land engagement. The chief inconvenience to which a ship is exposed, on the contrary, is, that the low-laid cannon in a fort near the brink of the sea, may strike her repeatedly on or under the surface of the water, so as to sink her before her cannonade can have any considerable efficacy.

CANNULA, in surgery, a tube made of different metals, principally of silver and lead, but sometimes of iron.

They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance; or into wounds, either accidental or artificial, of the large cavities, as the thorax or abdomen: they are used in the operation of bronchotomy; and, by some, after cutting for the stone, as a drain for urine.

Other cannulas are used for introducing cauteries, either actual or potential, into hollow parts, in order to guard the parts adjacent to that to be cauterized, from injury. They are of various figures; some being oval, some round, and others crooked.

CANO, a kingdom of Africa, in Negroland, with a town of the same name. It is bounded by Zaara on the north, by the river Niger on the south, the kingdom of Agades on the west, and that of Cassina on the east. Some of the inhabitants are herdsmen, and others till the ground and dwell in villages. It produces corn, rice, and cotton. Here are also many deserts, and mountains covered with woods, in which are wild citrons and lemon trees. The walls and houses of the town are made of clay, and the principal inhabitants are merchants. E. Long. 16. 18. N. Lat. 21. 5.

CANOBI, a town of Italy, in the duchy of Milan, seated on the western bank of Lago Maggiore, or the Greater Lake. E. Long. 8. 47. N. Lat. 45. 55.

CANOE, a sort of Indian boat or vessel, formed of the trunk of a tree hollowed, and sometimes of several pieces of the bark put together.

Canoes are of various sizes, according to the uses for which they may be designed, or the countries wherein they are formed. The largest are made of the cotton tree; some of them will carry between 20 and 30 hogheads of sugar or molasses. Some are made to carry sail: and for this purpose are steeped in water till they become pliant; after which their sides are extended, and strong beams placed between them, on which a deck is afterwards laid that serves to support their sides. The other sorts very rarely carry sail, unless when going before the wind: their sails are made of a sort of short silk grass or rushes. They are commonly rowed with paddles, which are pieces of light wood somewhat resembling a corn-shovel; and, instead of rowing with it horizontally like an oar, they manage it perpendicularly. The small canoes are very narrow, having only room for one person in breadth, and seven or eight lengthwise. The rowers, who are generally American savages, are very expert in managing their paddles uniformly, and in balancing the canoes with their bodies; which would be difficult for a

stranger to do, how well accustomed soever to the conducting of European boats, because the canoes are extremely light, and liable to be overturned. The American Indians, when they are under the necessity of landing to avoid a water-fall, or of crossing the land from one river to another, carry their canoes on their heads, till they arrive at a place where they can launch them again. This is the general construction of canoes, and method of managing them: but some nations have vessels going under the name of canoes, which differ considerably from the above; as the inhabitants of Greenland, Hudson's-bay, Otaheite, &c.

CANON, a person who possesses a prebend, or revenue allotted for the performance of divine service, in a cathedral, or collegiate church.

Canons are of no great antiquity: Paschier observes, that the name canon was not known before Charlemagne; at least the first we hear of are in Gregory de Tours, who mentions a college of canons instituted by Baldwin XVI. archbishop of that city, in the time of Clotharius I. The common opinion attributes the institution of this order to Chrodegangus, bishop of Metz, about the middle of the eighth century.

Originally canons were only priests, or inferior ecclesiastics, who lived in community; residing by the cathedral church, to assist the bishop; depending entirely on his will; supported by the revenues of the bishopric; and living in the same house, as his domestics, or counsellors, &c. They even inherited his moveables, till the year 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule substituted in the place of that which had been appointed by Chrodegangus, and which was observed for the most part in the west till the twelfth century. By degrees, these communities of priests, shaking off their dependence, formed separate bodies; whereof the bishops, however, were still heads. In the tenth century, there were communities or congregations of the same kind, established even in cities where there were no bishops: these were called collegiate, as they used the terms congregation and college indifferently: the name chapter, now given to these bodies, being much more modern. Under the second race of the French kings, the canonical, or collegiate life, had spread itself all over the country; and each cathedral had its chapter, distinct from the rest of the clergy. They had the name canon from the Greek *κανον*, which signifies three different things; a rule, a pension, or fixed revenue to live on, and a catalogue or matricula; all which are applicable to them.

In time, the canons freed themselves from their rules, the observance relaxed, and, at length, they ceased to live in community: yet they still formed bodies; pretending to other functions besides the celebration of the common office in the church; yet assuming the rights of the rest of the clergy; making themselves as a necessary council of the bishop; taking upon them the administration of a see during a vacancy, and the election of a bishop to supply it. There are even some chapters exempt from the jurisdiction of the bishop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones also continued to form bodies, after they had abandoned living in community.

CANONS are of various kinds; as,

Canon.

Cardinal

Canon.

Canon.

Cardinal CANONS, which are those attached, and, as the Latins call it, *incardinati* to a church, as a priest is to a parish.

Domicellary CANONS, were young canons, who, not being in orders, had no right in any particular chapters.

Expectative CANONS, were such as, without having any revenue or prebend, had the title and dignities of canons, a voice in the chapter, and a place in the choir; till such time as a prebend should fall.

Foreign CANONS, were such as did not officiate in the canonries to which they belonged. To these were opposed mansionary canons, or canons residentiary.

Lay or honorary CANONS, are such among the laity as have been admitted, out of honour and respect, into some chapter of canons.

Regular CANONS, are canons that still live in community; and who, like religious, have, in process of time, to the practice of their rules, added the solemn profession of vows. They are called regulars, to distinguish them from those secular canons who abandon living in community, and at the same time the observance of the canons made as the rule of the clergy, for the maintenance of the ancient discipline. The canons subsisted in their simplicity till the eleventh, some say the twelfth century, when some of them, separating from the community, took with them the name of canons, or acephalous priests, because they declined to live in community with the bishop; and those who were left thenceforth acquired the denomination of canons regular, and adopted most of the professions of the rule of St Augustine. This order of regular canons of St Augustine was brought into England by Adelwald, confessor to Henry I. who erected a priory at Nostel in Yorkshire; and obtained for them the church of Carlisle as an episcopal see, with the privilege of choosing their own bishop. They were singularly protected and encouraged by Henry I. who gave them the priory of Dunstable in 1107, and by queen Maud, who, in the following year, gave them the priory of the Holy Trinity in London. It appears, that under the reign of Edward I. they had 53 priories.

Tertiary CANONS, those who had only the third part of the revenues of the canonicate.

CANON, in an ecclesiastical sense, is a law or rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the authority of the sovereign.

Canons are properly decisions of matters of religion; or regulations of the policy and discipline of a church, made by councils, either general, national, or provincial. Such are the canons of the council of Nice, or Trent, &c.

There have been various collections of the canons of the Eastern councils; but four principal ones, each ampler than the preceding. The first, according to Usher, A. D. 380, containing only those of the first œcumenical council, and the first provincial ones: they were but 164 in number. To these, Dionysius Exiguus, in the year 520, added the 50 canons of the apostles, and those of the other general councils. The Greek canons in this second collection end with those of the council of Chalcedon; to which are subjoined those of the council of Sardica, and the African coun-

cils. The fourth and last collection comes down as low as the second council of Nice; and it is on this that Balsamon and Zonaras have commented.

Apostolical CANONS, are those which have been usually ascribed to St Clement. Bellarmin, Baronius, &c. will have them to be genuine canons of the apostles: Cotelierius observes, that they cannot be ascribed to the apostles or Clement, because they are not received with other books of scripture, are not quoted by the writers of the first ages, and contain many things not agreeable to the apostolical times: Hincmar, De Marca, Beveridge, &c. take them to be framed by the bishops who were the apostles disciples in the second or third century; S. Basnage is of opinion, that they were collected by an anonymous writer in the fifth century; but Daille, &c. maintain them to have been forged by some heretic in the sixth century; and S. Basnage conjectures, that some of them are ancient, and others not older than the seventh century. The Greek church allow only 85 of them, and the Latins only 50; though there are 84 in the edition given of them in the *Corpus Juris Canonici*.

CANON is also used for the authorised catalogue of the sacred writings. See BIBLE.

The ancient canon, or catalogue of the books of the Old Testament, was made by the Jews, and is ordinarily attributed to Ezra; who is said to have distributed them into the law, the prophets, and the hagiographa, to which our Saviour refers, Luke, chap. xxiv. ver. 44. The same division is also mentioned by Josephus, cont. Appion.

This is the canon allowed to have been followed by the primitive church, till the council of Carthage; and, according to St Jerom, this consisted of no more than 22 books; answering to the number of the Hebrew alphabet; though at present they are classed into 24 divisions, containing Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Samuel, Kings, Isaiah, Jeremiah, Ezekiel, the twelve minor prophets, the Psalms, the Proverbs, Job, Canticles, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, comprehending the book of Nehemiah and the Chronicles. However, this order is not universally observed either among Jews or Christians: nor were all the books above enumerated admitted into the canon in Ezra's time. It is most likely, says Dr Prideaux, that the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were added in the time of Simon the Just, when the canon was completed. But that council enlarged the canon very considerably, taking into it the books which we call apocryphal; which the council of Trent has further enforced, enjoining all these to be received as books of Holy Scripture, upon pain of anathema, and being attainted of heresy. The Romanists, in defence of this canon, say, that it is the same with that of the council of Hippo, held in 393; and with that of the third council of Carthage, in 397, at which were present 46 bishops, and, among the rest, St Augustine; who declared that they received it from their fathers.

Their canon of the New Testament perfectly agrees with ours. It consists of books that are well known; some of which have been universally acknowledged; such are the four Gospels, the Acts of the Apostles, thirteen Epistles of St Paul, one Epistle of St Peter, and

Canon.

and one Epistle of St John: and others, concerning which doubts were entertained, but which were afterwards received as genuine; such are the epistle to the Hebrews, that of James, the second of Peter, the second and third of John, that of Jude, and the Revelation. These books were written at different times, and they are authenticated, not by the decrees of councils, or infallible authority, but by such kind of evidence as is thought sufficient in the case of any other ancient writings. They were very extensively diffused; they were read in every Christian society; they were valued and preserved with care by the first Christians; they were cited by Christian writers of the second, third, and fourth century, as by Irenæus, Clement the Alexandrian, Tertullian, Origen, Eusebius, &c. and their genuineness is proved by the testimony of those who were contemporary with the apostles themselves, and by tradition. The four Gospels, and most of the other books of the New Testament, were collected either by one of the apostles, or some of their disciples and successors, before the end of the first century. The catalogue of canonical books furnished by the more ancient Christian writers, as Origen about the year 210, Eusebius and Athanasius in 315, Epiphanius in 370, Jerome in 382, Austin in 394, and many others, agrees with that which is now received among Christians. For the time of writing the several books of the New Testament, see the titles of the books themselves; as the Gospel of St MATTHEW, MARK, &c.

Some of the fathers distinguish the inspired writings into three classes; proto-canonical, deutero-canonical, and apocryphal.

Paschal CANON, a table of the moveable feasts, showing the day of Easter, and the other feasts depending on it, for a cycle of 19 years.

The paschal canon is supposed to be the calculation of Eusebius of Cæsarea, and to have been done by order of the council of Nice.

CANON, in monastic orders, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them as their local statutes. This is also called *regula*, as containing the rule and institution of their order.

The canon differs from the missale, martyrologium, and necrologium.

CANON, again, is used for the catalogue of saints acknowledged and canonized in the Roman church.

CANON is also used, by way of excellence, in the Romish church, for the secret words of the mass, from the preface to the *Pater*; in the middle of which the priest consecrates the host. The common opinion is, that the canon of the mass commences with *Te igitur*, &c. The people are to be on their knees, hearing the canon; and are to rehearse it to themselves, so as not to be heard.

CANON, in the ancient music, is a rule or method of determining the intervals of notes.

Ptolemy, rejecting the Aristoxenian way of measuring the intervals in music, by the magnitude of a tone (which was supposed to be formed by the difference between a diapente and a diatessaron), thought that musical intervals should be distinguished, according to the ratios or proportions which the sounds terminating those intervals bear to one another, when considered

Canon.

according to their degree of acuteness or gravity; which, before Aristoxenus, was the old Pythagorean way. He therefore made the diapason consist in a double ratio; the diapente, in a sesquialterate; the diatessaron, in a sesquitercian; and the tone itself, in a sesquioctave; and all the other intervals, according to the proportion of the sounds that terminate them: wherefore taking the canon (as it is called) for a determinate line of any length, he shows how this canon is to be cut accordingly, so that it may represent the respective intervals: and this method answers exactly to experiment, in the different lengths of musical chords. From this canon, Ptolemy and his followers have been called *Canonici*; as those of Aristoxenus were called *Musici*.

CANON, in modern music, is a kind of fugue, which they call a *perpetual fugue*, because the different parts beginning one after another, repeat incessantly the same air.

Formerly, says Zarlino, they placed, at the head of perpetual fugues, particular directions which showed how this kind of fugues was to be sung; and these directions being properly the rules by which perpetual fugues were composed were called *canoni*, *rules*, or *canons*. From this custom, others taking the title for the thing signified, by a metonymy, termed this kind of composition *canon*. Such canons as are composed with the greatest facility, and of consequence most generally used, begin the fugue either with the octave or the unison; that is to say, that every part repeats in the same tone the melody of the preceding. In order to form a canon of this kind, it is only necessary for the composer to make an air according to his taste; to add in score as many parts as he chooses, where the voices in octave or unison repeat the same melody; then forming a single air from all these parts successively executed, to try whether this succession may form an entire piece which will give pleasure, as well in the harmony as the melody.

In order to execute such a *canon*, he who sings the first part begins alone, and continues till the air is finished; then recommences immediately, without any suspension of sound or interruption of time: as soon as he has ended the first couplet, which ought to serve for the perpetual subject upon which the whole *canon* has been composed, the second part begins and repeats the same couplet, whilst the first who had begun pursues the second: others in succession begin, and proceed the same way, as soon as he who precedes has reached the end of the first couplet. Thus, by incessantly recommencing, an universal close can never be found, and the *canon* may be repeated as long as the singers please.

A perpetual fugue may likewise consist of parts which begin with the intervals of a fourth or fifth; or, in other words, every part may repeat the melody of the first, a fourth or a fifth higher or lower. It is then necessary that the whole *canon* should be invented *di prima intenzione*, as the Italians say; and that sharps or flats should be added to the notes, whose natural gradations do not answer exactly, by a fourth or fifth, to the melody of the preceding part, and produce the same intervals with itself. Here the composer cannot pay the least regard to modulation; his only care is, that the melody may be the same, which renders the formation of

of

Canon.

of a *canon* more difficult; for at every time when any part resumes the fugue, it takes a new key; it changes the tone almost at every note, and what is still worse, no part is at the same time found in the same tone with another; hence it is that this kind of *canons*, in other respects far from being easy to be pursued, never produces a pleasing effect, however good the harmony may be, and however properly it may be sung.

There is a third kind of *canon*, but very scarce, as well because it is extremely difficult, as because it is for the most part incapable of giving pleasure, and can boast no other merit but the pains which have been thrown away in its composition. This may be called a *double canon inverted*, as well by the inversions which are practised in it with respect to the melody of the parts, as by those which are found among the parts themselves, in singing. There is such an artifice in this kind of *canon*, that, whether the parts be sung in their natural order, or whether the paper in which they are set be turned the contrary way, to sing them backward from the end to the beginning, in such a manner that the bass becomes the upper part, and the rest undergo a similar change, still you have pretty harmony, and still a regular *canon*. The reader may consult Rousseau's Dictionary in this article, where he is referred to plate D fig. 11. for two examples of canons of this sort extracted from Bontempi, who likewise gives rules for their composition. But he adds, that the true principle from which this rule is deduced will be found at the word *Système*, in his account of the system of Tartini, to which we must likewise once more refer the reader; as a quotation of such length must have protracted our article to an enormous extent.

To form a *canon* in which the harmony may be a little varied, it is necessary that the parts should not follow each other in a succession too rapid, and that the one should only begin a considerable time after the other. When they follow one another so immediately as at the distance of a semibreve or a minim, the duration is not sufficient to admit a great number of chords, and the canon must of necessity exhibit a disagreeable monotony; but it is a method of composing, without much difficulty, a canon in as many parts as the composer chooses. For a *canon* of four bars only, will consist of eight parts if they follow each other at the distance of half a bar; and by each bar which is added, two parts will constantly be gained.

The emperor Charles VI. who was a great musician, and composed extremely well, took much pleasure in composing and singing *canons*. Italy is still replete with most beautiful *canons* composed for this prince, by the best masters in that country. To what has been said by Rousseau, we need only subjoin, that the English *catch* and the Italian *canon* are much the same; as any intelligent reader may perceive, from comparing the structure and execution of the English *catch* with the account of *canons* which has now been given.

CANON, in geometry and algebra, a general rule for the solution of all cases of a like nature with the present inquiry. Thus every last step of an equation is a canon; and, if turned into words, becomes a rule to solve all questions of the same nature with that proposed.

CANON-LAW, a collection of ecclesiastical laws, serving as the rule and measure of church-government.

The power of making laws was exercised by the church before the Roman empire became Christian. The canon-law that obtained throughout the West, till the 12th century, was the collection of canons made by Dionysius Exiguus in 520, the capitularies of Charlemagne, and the decrees of the popes from Siricius to Anastasius.

The canon-law, even when papal authority was at its height in England, was of no force when it was found to contradict the prerogative of the king, the laws, statutes, and customs of the realm, or the doctrine of the established church.

The ecclesiastical jurisdiction of the see of Rome in England was founded on the canon-law; and this created quarrels between kings and several archbishops and prelates who adhered to the papal usurpation.

Besides the foreign canons, there were several laws and constitutions made here for the government of the church: but all these received their force from the royal assent; and if, at any time, the ecclesiastical courts did, by their sentence, endeavour to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibition. The authority vested in the church of England of making canons, was ascertained by a statute of Henry VIII. commonly called the *act of the clergy's submission*; by which they acknowledged, that the convocation had always been assembled by the king's writ; so that though the power of making canons resided in the clergy met in convocation, their force was derived from the authority of the king's assenting to and confirming them.

The old canons continued in full force till the reign of James I. when the clergy being assembled in convocation, the king gave them leave to treat and consult upon canons; which they did, and presented them to the king, who gave them the royal assent: these were a collection out of the several preceding canons and injunctions. Some of these canons are now obsolete. In the reign of Charles I. several canons were passed by the clergy in convocation.

CANONESS, in the Romish church, a woman who enjoys a prebend, affixed, by the foundation, to maids, without their being obliged to renounce the world or make any vows.

CANONICA, in philosophical history, an appellation given by Epicurus to his doctrine of logic. It was called *canonica*, as consisting of a few canons or rules for directing the understanding in the pursuit and knowledge of truth. Epicurus's *canonica* is represented as a very slight and insufficient logic by several of the ancients, who put a great value on his ethics and physics. Laertius even assures us, that the Epicureans rejected logic as a superfluous science; and Plutarch complains that Epicurus made an unskilful and preposterous use of syllogisms. But these censures seem too severe. Epicurus was not averse to the study of logic, but even gave better rules in this art than those philosophers who aimed at no glory but that of logics. He only seems to have rejected the dialectics of the stoics, as full of vain subtleties and deceits, and fitted rather for parade and disputation than real use. The stress of Epicurus's *canonica* consists in his doctrine of the criteria of truth. All questions in philosophy are either concerning words or things: concerning things,

Canon
||
Canonica.

we.

Canonical. we seek their truth; concerning words, their signification: things are either natural or moral; and the former are either perceived by sense or by the understanding. Hence, according to Epicurus, arise three criterions of truth, *viz.* sense, anticipation or prænotion, and passion. The great canon or principle of Epicurus's logic is, that the senses are never deceived; and therefore, that every sensation or perception of an appearance is true.

CANONICAL, something that belongs to, or partakes of, the nature of a rule or canon.

CANONICAL Hours, are certain stated times of the day, consigned, more especially by the Romish church, to the offices of prayer and devotion. Such are *matins, lauds, sixth, ninth, vespers*. In our country the canonical hours are from eight to twelve in the forenoon, before or after which marriage cannot be legally performed in any parish-church.

CANONICAL Obedience, is that submission which, by the ecclesiastical laws, the inferior clergy are to pay to their bishops, and religious to their superiors.

CANONICAL Sins, in the ancient church, those which were capital or mortal. Such especially were idolatry, murder, adultery, heresy, and schism.

CANONICAL Punishments, are those which the church may inflict; such as excommunication, degradation, and penance, in Roman Catholic countries, also fasting, alms, whipping, &c.

CANONICAL Life, the method or rule of living prescribed by the ancient clergy who lived in community. The canonical life was a kind of medium between the monastic and clerical lives. Originally the orders of monks and clerks were entirely distinct; but pious persons, in process of time, instituted colleges of priests and canons, where clerks brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which, though somewhat more easy than the monastic, was yet more restrained than the secular. This was called the *canonical life*, and those who embraced it *canons*.—Authors are divided about the founder of the canonical life. Some will have it to be founded by the apostles; others ascribe it to pope Urban I. about the year 1230, who is said to have ordered bishops to provide such of their clergy as were willing to live in community, with necessities out of the revenues of their churches. The generality attribute it to St Augustin; who, having gathered a number of clerks to devote themselves to religion, instituted a monastery within his episcopal palace, where he lived in community with them. Onuphrius Panvinus brings the institution somewhat lower; according to him, pope Gelasius I. about the year 495, placed the first regular canons of St Augustin in the Lateran church.

CANONICAL Letters, in the ancient church, were a sort of testimonials of the orthodox faith, which the bishops and clergy sent each other to keep up the catholic communion, and distinguish orthodox Christians from Arians and other heretics. They were denominated *canonical*, either as being composed according to a certain rule or form, or because they were given to the *canonici*, that is, those comprehended in the canon or catalogue of their church. When they had occasion to travel into other dioceses or countries, dimissory and

Nº 63.

recommendatory letters, also letters of peace, &c. were so many species of canonical letters.

CANONICAL is also an appellation given to those epistles in the New Testament more frequently called *catholic* or *general* epistles.

CANONICUM, in a general sense, denotes a tax or tribute.

CANONICUM is more particularly used in the Greek church for a fee paid by the clergy to bishops, archbishops, and metropolitans, for degrees and promotions.

CANONICUM also denotes a due of first-fruits, paid by the Greek laity to their bishops, or, according to Du-Cange, to their priests. The *canonicum* is assessed according to the number of houses or chimnies in a place.

The emperor Isaac Comnenus made a constitution for regulating the *canonicum* of bishops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing thirty fires, was to pay for its *canonicum* one piece of gold, two of silver, one sheep, six bushels of barley, six of wheat, flour, six measures of wine, and thirty hens.

CANONIST, a person skilled in or who makes profession of the study and practice of the canon law. Canonists and civilians are usually combined in the same persons: and hence the title of *doctor juris utriusque*, or *legum doctor*, usually expressed in abbreviation, L. L. D. or J. U. D.

CANONIZATION, a ceremony in the Romish church, by which persons deceased are ranked in the catalogue of the saints. It succeeds beatification.

Before a beatified person is canonized, the qualifications of the candidate are strictly examined into, in some consistories held for that purpose; after which, one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles: which done, the holy father decrees his canonization, and appoints the day.

On the day of canonization the pope officiates in white, and their eminences are dressed in the same colour. St Peter's church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonization, are embroidered in gold and silver. An infinite number of lights blaze all round the church, which is crowded with pious souls, who wait with devout impatience till the new saint has made his public entry as it were into paradise, that they may offer up their petitions to him without danger of being rejected.

The following maxim with regard to canonization is now observed, though it has not been followed above a century, *viz.* not to enter into the inquiries prior to canonization, till 50 years, at least, after the death of the person to be canonized. By the ceremony of canonization, it appears that this rite of the modern Romans has something in it very like the apotheosis or deification of the ancient Romans, and, in all probability, takes its rise from it; at least several ceremonies of the same nature are conspicuous in both.

CANONRY, the benefice filled by a canon. It differs from a prebend, in that the prebend may subsist without

Canonical
||
Canonry.

Canopus,
Canofa.

without the canonicate: whereas the canonicate is inseparable from the prebend: again, the rights of suffrages, and other privileges, are annexed to the canonicate, and not to the prebend.

CANOPUS, in astronomy, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere.

CANOPUS, in Pagan mythology, one of the deities of the ancient Egyptians, and, according to some, the god of water. It is said, that the Chaldeans, who worshipped fire, carried their fancied deity thro' other countries to try its power, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver, and gold, its priests declared, that all gods did it homage. This the priests of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards stopped with wax, and having filled the vessel with water, painted it of several colours, and fitting the head of an idol to it, brought it out, in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all around it; but the heat having melted the wax, the water gushed out thro' the holes, and extinguished the fire; and thus Canopus conquered the god of the Chaldeans.

CANOPUS, or *Canobus*, according to Strabo, had been Menelaus's pilot, and had a temple erected to him in a town called *Canopus*, near one of the mouths of the Nile. Dionysius mentions it:

Καὶ τιμῆς περιπύου Ἀμυκλαίοιο Κανόβου,
There stands Canobus' temple known to fame;
The pilot who from fair Amycla came.

Vossius remarks, on this occasion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named *Canopus*, took from thence an opportunity of deifying the pilot of Menelaus who bore the same name, and giving out that the Egyptian god Canopus had been a Greek. F. Monfaucon gives several representations of this deity. One, in allusion to the victory above mentioned, throws out water on every side through little holes.

CANOPUS, or *Canobus*, (anc. geog.) a town of the Lower Egypt, on the Mediterranean, an hundred and twenty stadia, or fifteen miles to the east of Alexandria; as old as the war of Troy, Canopus, or Canobus, Menelaus's steersman, being there buried. *Canopaci*, the gentilitious name: famous for their luxury and debauchery, (Strabo, Juvenal.) See *ABOUKIR*.

CANOPY, in architecture and sculpture, a magnificent kind of decoration, serving to cover and crown an altar, throne, tribunal, pulpit, chair, or the like. The word is formed from the barbarous Latin *canopeum*, of *κωνοπέριον*, a net spread over a bed to keep off the gnats, from *κωνοψ* a gnat.

Canopies are also borne over the head in processions of state, after the manner of umbrellas. The canopy of an altar is more peculiarly called *Ciborium*.

The Roman grandees had their canopies, or spread veils, called *thense*, over their chairs: the like were also in temples over the statues of the gods. The modern cardinals still retain the use of canopies.

CANOSA, a town of Puglia in Italy, occupying

part of the site of the ancient Canusium. The old city was founded by Diomede, according to Strabo. It afterwards became a Roman colony, and one of the most considerable cities of this part of Italy for extent, population, and magnificence in building. The æra of Trajan seems to have been that of its greatest splendour; but this pomp only served to mark it as a capital object for the avarice and fury of the Barbarians. Genseric, Totila, and Antharis, treated it with extreme cruelty. The deplorable state to which this province was reduced in 590 is concisely but strongly painted by Gregory the Great, in these terms: "On every side we hear groans! on every side we behold crowds of mourners, cities burnt, castles rased to the ground, countries laid waste, provinces become deserts, some citizens led away captives, and others inhumanly massacred." No town in Puglia suffered more than Canosa from the outrages of the Saracens; the contests between the Greeks and Normans increased the measure of its woes, which was filled by a conflagration that happened when it was stormed by duke Robert. In 1090, it was assigned, by agreement, to Bohemund prince of Antioch, who died here in 1111. Under the reign of Ferdinand the Third, this estate belonged to the Grimaldis. On their forfeiture, the Affaititi acquired it, and still retain the title of marquis, though the Capeci are the proprietors of the fief.

The ancient city stood in a plain between the hills and the river Ofanto, and covered a large tract of ground. Many brick monuments, though degraded and stripped of their marble casing, still attest its ancient grandeur. Among them may be traced the fragments of aqueducts, tombs, amphitheatre baths, military columns, and two triumphal arches, which, by their position, seem to have been two city gates. The present town stands above, on the foundations of the old citadel, and is a most pitiful remnant of so great a city, not containing above three hundred houses. The church of St Sabinus, built, as is said, in the sixth century, is now without the inclosure. It is astonishing, that any part of this ancient cathedral should have withstood so many calamities. Its altars and pavements are rich in marbles; and in a small court adjoining, under an octagonal cupola, is the mausoleum of Bohemund, adorned in a minute Gothic style.

CANSO, a sea-port town of Acadia, or Nova Scotia, in North America, seated on a narrow strait which separates Nova Scotia from Cape Breton. Near this town is a fine fishery for cod. W. Long. 62. N. Lat. 46.

CANSTAT, a town of Swabia, in Germany, in the duchy of Wirtemberg, situated on the river Neckar, in E. Long. 9. 9. N. Lat. 48. 51.

CANT, a quaint affected manner of speaking, adapted chiefly to the lower sort. Skinner racks his invention for the origin of this word; which he successively deduces from the German, Flemish, and Saxon tongues. According to the general opinion, Cant is originally the proper name of a Cameronian preacher in Scotland, who by exercise had obtained the faculty of talking in the pulpit in such a tone and dialect as was understood by none but his own congregation: since Andrew Cant's time, the word has been extended to signify all sudden exclamations, and whining unmusical tones, especially in praying and preaching. But this

Canosa
||

page 408.

Cant.
Cantabria.

origin of the word has been disputed by others; and perhaps the true derivation is from the Latin *cantare* "to sing."

* See Cant-
ing Lan-
guage.

CANT is also applied to words and phrases affected by particular persons or professions for low ends, and not authorised by the established language*. The difference between *cant* and *technical* seems to be this: the former is restrained to words introduced out of folly, affectation, or imposture; the latter is applied to such as are introduced for the sake of clearness, precision, and significancy.

CANT is also used to denote a sale by auction. The origin of the word in this sense is dubious; it may come, according to some, from *quantum*, how much; according to others, from *cantare*, to sing or cry aloud; agreeably to which, we sometimes also call it an *out-cry*.

CANT-Timbers, in ship-building, those timbers which are situated at the two ends of a ship. They derive their name from being *canted*, or raised obliquely from the keel; in contradistinction from those whose planes are perpendicular to it. The upper ends of those on the bow, or fore-part of the ship, are inclined to the stern; as those in the after, or hind part, incline to the stern-post above. See *SHIP-Building*.

† See Astu-
ria.

CANTABRIA, (anc. geog.), a district of Terraconensis, on the Oceanus Cantabricus or bay of Biscay; now BISCAY. The inhabitants were famous for their warlike character. In conjunction with the Asturians†, they carried on desperate wars with the Romans; but were subdued by them about 25 years before Christ. Being impatient, however, of a foreign yoke, they in a few years revolted. Most of their youth had been already taken prisoners by the Romans, and sold for slaves to the neighbouring nations: but having found means to break their chains, they cut the throats of their masters; and returning into their own country, attacked the Roman garrisons with incredible fury. Agrippa marched against them with great expedition; but, on his arrival, met with so vigorous a resistance, that his soldiers began to despair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; well knowing, that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage, and cruel slavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expressed, routed them in several engagements, and defended themselves when attacked by the enemy with such intrepidity, that Agrippa afterwards owned, that he had never, either by sea or land, been engaged in a more dangerous enterprize. That brave commander was obliged to use intreaties, menaces, and to brand some of his legionaries with ignominy, before he could bring them to enter the lists with such a formidable enemy. But having at last, with much ado, prevailed upon them to try the chance of an engagement in the open field, he so animated them by his example, that, after a most obstinate dispute, he gained a complete victory, which indeed cost him dear, but put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces; their castles and strong holds

taken and rased; and their women, children, and old men (none else being left alive), were obliged to abandon the mountainous places, and settle in the plain.

Cantabria
||
Cantacuzenus.

Dr Wallis seems to make the Cantabrian the ancient language of all Spain: which, according to him, like the Gaulish, gave way to a kind of broken Latin called *romance*, or *romanſhe*; which by degrees was refined into the Castilian or present Spanish. But we can hardly suppose, that so large a country, inhabited by such a variety of people, spoke all the same language. The ancient Cantabrian, in effect, is still found to subsist in the more barren and mountainous parts of the province of Biscay, Asturias, and Navarre, as far as Bayonne, much as the British does in Wales; but the people only talk it: for writing, they use either the Spanish or French, as they happen to live under the one or the other nation. Some attribute this to a jealousy of foreigners learning the mysteries of their language; others to a poverty of words and expressions. The Cantabrian does not appear to have any affinity with any other known language, abating that some Spanish words have been adopted in it for things whose use the Biscayens were anciently unacquainted with. Its pronunciation is not disagreeable. The Lord's prayer, in the Cantabrian tongue, runs thus: *Gure aita cervetan aicena, santifica bedi hire icena, etbor bedi hire refuma, eguin bedi hire vorondatea cervan becala hurrean ere, &c.*

CANTABRICA, in botany: A synonyme of a species of CONVULVULUS.

CANTABRUM, in antiquity, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bearing on it some words or motto of good omen, to encourage the soldiers.

CANTACUZENUS (Johannes), of Constantinople, a celebrated statesman, general, and historian, was born in that city, of a very ancient and noble family. He was bred to letters and to arms, and admitted to the highest offices of the state. The emperor Andronicus loaded him with wealth and honour; made him generalissimo of his forces; and was desirous of having him join him in the government, but this he refused. Andronicus dying in 1341, left to Cantacuzenus the care of the empire, till his son John Paleologus, who was then but nine years of age, should be fit to take it upon himself. This trust he faithfully discharged; till the empress dowager and her faction forming a party against him, declared him a traitor. On this the principal nobility and the army besought him to ascend the throne; and accordingly he was crowned on the 21st of May 1342. This was followed by a civil war, which lasted five years; when he admitted John a partner with him in the empire, and their union was confirmed by his giving him his daughter in marriage. Suspicions and enmities, however, soon arising, the war broke out again, and continued till John took Constantinople in 1355. A few days after, Cantacuzenus, unwilling to continue the effusion of blood, abdicated his share of the empire, and retiring to a monastery, took the habit of a monk, and the name of *Joasaphas*. His wife also retired to a nunnery, and changed her name of *Irene* for that of *Eugenia*. In this retirement he lived till the year 1411, when he was upwards of 100 years of age. Here he wrote a history of his own times, a Latin translation of which, from the Greek manuscript, was pub-

Cantalivers
||
Cantemir

published by Pontanus at Ingolstadt, in 1603: and a splendid edition was printed at Paris in 1645, in three volumes folio, of the original Greek, and Pontanus's Latin version. He also wrote an apology for the Christian religion against that of Mahomet, under the name of *Ghrifodulus*.

CANTALIVERS, in architecture, pieces of wood framed into the front or sides of a house, to suspend the mouldings and eyes over it.

CANTAR, or CANTARO, an eastern weight, of different value in different places, equal at Acra in Turkey to 603 pounds, at Tunis and Tripoli to 114 pounds.

CANTAR is also an Egyptian weight, which is denominated a *quintal*, and consists of an hundred or of an hundred and fifty rotolos, according to the goods they are to weigh.

CANTARO is also an Egyptian weight, which at Naples is equivalent to 25 pounds, at Genoa to 150 pounds. At Leghorn there are three kinds of *contaros*, one weighing 150 pounds, another 151, and a third 160 pounds.

CANTARO is also a Spanish liquid measure, in use especially at Alicant, containing three gallons.

CANTARO is also a measure of capacity, used at Cochinchina, containing four rubies, the rubi 32 rotolos.

CANTARINI (Simon), a famous painter, called the *Pesarese*, from his being born at Pesaro, was the disciple of Guido; and copied the manner of his master so happily, that it is often difficult to distinguish between their works. He died at Verona in 1648.

CANTATA, in music, a song or composition, intermixed with recitatives, airs, and different movements, chiefly intended for a single voice, with a thorough bass, though sometimes for other instruments.

The cantata, when performed with judgement, has something in it very agreeable; the variety of the movement not clogging the ear, like other compositions. It was first used in Italy, then in France, whence it passed to us.

CANTAZARO, an episcopal city of Italy, in the kingdom of Naples, and in the territory of Calabria Ulterior. It is the residence of the governor of the province, and is seated near the sea, in E. Long. 17. 0. N. Lat. 38. 59.

CANTECROIX, a small territory of the Netherlands, in Brabant, and in the quarter of Antwerp, with the title of a principality; there is a small town of the same name, but Lire is the capital.

CANTEMIR (Demetrius), son of a prince of Moldavia. Disappointed by not succeeding his father in that dignity, held under the Ottoman Port, he went over with his army to the Czar Peter the great, against whom he had been sent by the Grand Signior: he signalized himself in the Czar's service; and in the republic of letters, by a Latin history of the origin and decline of the Ottoman empire, &c. Died in 1723.

CANTEMIR (Antiochus), esteemed the founder of the Russian poetry, was the youngest son of the preceding. Under the most ingenious professors, whom the czar had invited to Peterburgh, he learned mathematics, physic, history, moral philosophy, and polite literature; without neglecting the study of the Holy Scriptures, to which he had a great inclination. Scarce had he finished his academic course, when he

printed a Concordance to the Psalms in the Russian language, and was elected member of the academy. The affairs of state in which he was soon after engaged, did not make him neglect his literary pursuits. In order to make himself useful to his fellow-citizens, he composed his satires, to ridicule certain prejudices which had got footing among them. When but 23 years of age, he was nominated minister at the court of Great Britain; and his dexterity in the management of public affairs was as much admired as his taste for the sciences. He had the same reputation in France, whither he went in 1738, in quality of minister plenipotentiary, and soon after was invested with the character of ambassador extraordinary. The wise and prudent manner in which he conducted himself during the different revolutions which happened in Russia during his absence, gained him the confidence and esteem of three successive princes. He died of a dropsy, at Paris, in 1744, aged 44. Besides the pieces already mentioned, he wrote, 1. Some fables and odes. 2. A translation of Horace's epistles into Russian verse. 3. A prose translation of Fontenelle's plurality of worlds; and, 4. Algarotti's dialogues on light. The abbe Guaasco has written his life in French, and translated his satires into that language.

CANTERBURY, a city of England, and capital of the county of Kent, situated in E. Long. 1. 15. N. Lat. 51. 16. It had the names of *Durovernum* and *Darvernum* given it by the Romans, and *Durobernia* by Bede, which are thought to be derived from *Durwhem*, signifying a rapid stream, such as the Stour, on which it stands, is. The Britons call it *Caer-Kent*, i. e. the city of Kent; and its present English name is of the same import, derived from the Saxon. Modern writers in Latin call it *Cantuaria*. Its great antiquity appears not only from Antoninus's itinerary, but from the military way which has been discovered here, and the causeways leading to Dover and Lymme, besides the coins and other curiosities found about it. The archiepiscopal and metropolitanical dignity seems to have been settled here very early; and to prevent its being removed, an anathema was decreed against any who should attempt it. After that, the city flourished greatly; though it suffered in common with other towns during the Danish invasions, and at other times by the casualties of fire. The city was given entirely to the bishops by William Rufus, and was held in the utmost veneration in the Popish times, especially after the murder of Becket in the reign of Henry II. to whose shrine so great was the resort, and so rich were the offerings, that Erasmus, who was an eye-witness of its wealth, says the whole church and chapel in which he was interred glittered with jewels; and at the dissolution, the plate and jewels filled two great chests, each of which required eight strong men to carry out. The cathedral was granted by Ethelbert, king of Kent, upon his conversion, to Austin the monk, together with his palace, and the royalty of the city and its territories. This Austin founded a monastery for monks, called from him *Augustine*. After the cathedral had been several times destroyed by fire and rebuilt, the present was begun about the year 1174, and augmented and embellished by the succeeding archbishops, till it was completed in the reign of Henry V. It is a noble Gothic pile, and before the reformation had 37 altars

Cantemir,
Canter-
bury.

Canter-
bury.

altars. A great many kings, princes, cardinals, and archbishops, are buried in it. At the dissolution, Henry VIII. seized all the revenues both of the church and monastery, except what he allotted for the maintenance of a dean, 12 prebendaries, and six preachers, whom he established in place of the monks. During the grand rebellion, it suffered much; the usurper Cromwell having made a stable of it for his dragoons. After the restoration, it was repaired, and made what it now appears.

Besides the cathedral and other churches, as well as a monastery, the city had anciently a castle on the south-side, and strong walls, with towers, a ditch, and rampart; it had also a mint and an exchange. As to its government, it seems to have been entirely subject to the archbishop, both in spirituals and temporals; at least from the time that William Rufus gave it solely to bishop Anselm, till the reformation. It is now a county of itself; and the corporation consists of a mayor, recorder, 12 aldermen, a sheriff, 24 common-council-men, a mace-bearer, sword-bearer, and four serjeants at mace. Every Monday a court is held at Guildhall for civil and criminal causes; and every other Tuesday for the government of the city. Here were formerly 2000 or 3000 French Protestants employed in the silk manufacture; but this branch is now greatly decayed in the place, since Spitalfields became so flourishing. Besides the cathedral, it contains 15 parish-churches, seven hospitals, a free-school, a house of correction, a gaol for criminals, and a sumptuous conduit for supplying the inhabitants with water. It consists of four streets, disposed in the form of a cross, and divided into six wards, which are about three miles in circumference. It is surrounded on all hands with hop-grounds much to its advantage, and is famed for its excellent brawn.

The diocese of Canterbury contains 257 parishes, besides chapels, in Kent, and about 100 more in other dioceses. These are called *Peculiars*; it being an ancient privilege of this see, that, wheresoever the archbishops had either manors or advowsons, the place was exempted from the jurisdiction of the ordinary of the diocese where it was situated, and was deemed in the diocese of Canterbury. This see is valued in the king's books at L. 2816:17:9½, but is reckoned to produce a clear revenue of L. 8000 a-year. The clergy's tenths come to L. 651:18:2½. This see had many great privileges in the time of Popery, some of which it still retains. The archbishop is accounted primate and metropolitan of all England, and is the first peer in the realm; having the precedence of all dukes not of the blood-royal, and all the great officers of state. In common speech, he is styled *His Grace*, and he writes himself *Divina Providentia*; whereas other bishops style themselves *Divina Permissione*. At coronations, he places the crown on the king's head; and, wherever the court may be, the king and queen are the proper domestic parishioners of the archbishop of Canterbury. The bishop of London is accounted his provincial dean, the bishop of Winchester his sub-dean, the bishop of Lincoln his chancellor, and the bishop of Rochester his chaplain. This see hath yielded to the church 18 saints; to the church of Rome, 9 cardinals; to the civil state of England 12 lord chancellors, 4 lord treasurers, and 1 lord chief justice; and 9 chan-

cellors to the University of Oxford. To this see belongs only one archdeacon, viz. of Canterbury. To the cathedral belongs an archbishop, a dean, a chancellor, an archdeacon, 12 prebends, 6 preachers, 6 minor canons, 6 substitutes, 12 lay clerks, 10 choristers, 2 masters, 50 scholars, and 12 almsmen.

CANTERBURY-Bell, in botany: The English name of a species of CAMPANULA.

CANTERUS (William), an eminent linguist and philologist, was born at Utrecht, in 1542. He studied at Louvain and Paris; and gave surprising proofs of his progress in Greek and Latin literature. He afterwards visited the several universities of Germany and Italy; and died at Louvain, in 1575, aged 33. He understood six languages, besides that of his native country; and, notwithstanding his dying so young, wrote several philological and critical works, among which are, *Note, Scholia, Emendationes, et Explicationes, in Euripidem, Sophoclem, Æschylum, Ciceronem, Propertium, Aufonium, &c.* and many translations of Greek authors.

CANTHARIDES. See CANTHARIS and MELOE.

CANTHARIS, in zoology, a genus of insects belonging to the order of insecta coleoptera. The feelers of this genus are setaceous; the breast is margined, and shorter than the head; the elytra, or wing-cases, are flexile; and the sides of the belly are plated and papillous. Linnaeus enumerates 27 species of the cantharis, most of them to be found in different parts of Europe. The cantharis used in making blistering plasters, is ranked under a different genus, viz. the MELOE.

CANTHI, in anatomy, cavities at the extremities of the eye-lids, commonly called the *corners of the eye*: the greater of them, or the greater canthus, is next the nose; the lesser of them, or the little canthus, lies towards the temple.

CANTICLES, a canonical book of the Old Testament, otherwise called the *Song of Solomon*; by the Jews the *Song of Songs, Canticum Canticorum*. The book of Canticles is usually supposed to be an epithalamium composed by Solomon, on occasion of his marriage with the king of Egypt's daughter. But those who penetrate further into the mystery, find in it the marriage of Jesus Christ with human nature, the church, and good men. On this principle the Canticles is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and spiritual marriage is expressed. This song contains the adventures of seven days and seven nights; the exact time allowed for the celebration of marriage among the Hebrews. The Jews themselves, apprehending the book liable to be understood in a gross and carnal manner, prohibited the reading of it before the age of 30, and the same usage anciently obtained in the Christian church. Among the ancients, Theodore Mopsuetanus rejected the book of Canticles as not divine. Divers rabbins have also questioned its being written by inspiration. It is alleged, that the name of God is not once found in it. Mr Whiston has a discourse express to prove that the Canticles is not a sacred book of the Old Testament. He alleges it indeed to have been written by king Solomon the son of David; but asserts that it was composed at the time when that prince, blinded by his concubines, was sunk in lust and idolatry.

try. This he chiefly infers from the general character of vanity and dissoluteness which reigns thro' the Canticles; in which there is not, according to Whiston, one thought that leads the mind towards religion, but all is worldly and carnal, to say no worse. For the mystic sense, he asserts it to be without foundation; and that the book is not cited as canonical by any writer before the destruction of Jerusalem. Mr Whiston will have it to have been taken into the canon between the years 77 and 128, when allegories came into vogue, and the rabbins began to corrupt the text of Scripture. Grotius, Nierembergius, the Dutch divines who criticised F. Simon, Menetrier, Basnage, and some others, seem also to take the Canticles for a profane composition, on a footing with the love-pieces of Catullus or Ovid. But this opinion is refuted by Michaelis, Majus, Witfius, Nat. Alexander, Outrein, Francius, and others. Mr Whiston's arguments have been particularly considered by Itchener, and also by Dr Gill. R. Akiba finds the book of Canticles more divine than the rest: the whole world, according to this rabbin, is not worth that day when the Canticles was given to Israel; for, whereas all the hagiographers are holy, the Canticles is the holy of holies.

CANTIMARONS, or CATIMARONS, a kind of floats or rafts, used by the inhabitants of the coast of Coromandel to go a fishing in, and to trade along the coast. They are made of three or four small canoes, or trunks of trees dug hollow, and tied together with cacao ropes, with a triangular sail in the middle, made of matts. The persons who manage them are almost half in the water, there being only a place in the middle a little raised to hold their merchandize; which last particular is only to be understood of the trading cantimarons, and not of those who go fishing.

CANTIN (Cape), a promontory of the coast of Morocco in Africa, situated in W. Long. 10. 2. N. Lat. 33. 9.

CANTING, a sea-phrase, denotes the act of turning any thing about.

CANTING Language or dialect, is a mysterious sort of jargon used by gypsies, thieves, and strolling beggars, to express their sentiments to each other, without being understood by the rest of mankind. This dialect is not founded on any rules: yet, even out of that irregularity many words seem to retain something of scholarship; as *togeman* a gown, from *toga* in the Latin; *pannam*, bread, from *panis*; *casan*, cheese, from *caseus*, &c. It is observable, that, even unknown to ourselves, we have adopted some of their terms into our vulgar language; as *bite* and *bilk*, to cheat; *bounce*, to vapour; *bowse*, strong drink; *filch*, to steal; *flog*, to whip; *rig*, game or ridicule; *roast*, to rally; *rhino*, money. From the same source proceed the words *sham*, *banter*, *bubble*, *bully*, *sharper*, *cutting*, *shuffling*, *palming*, &c. An anonymous author has given a canting dictionary, comprehending all the terms used by the several tribes of gypsies, beggars, shoplifters, highwaymen, footpads, and other clans of cheats and villains, with a collection of songs in the canting dialect; London, 1725, 8vo.

CANTIUM, (anc. geog.) a promontory of Britain, literally denoting a head land; giving name to a territory called Cantium, now Kent; and to a people called Cantii, (Cæsar), commended for their great

humanity and politeness. The promontory now the North Foreland. It is supposed that this was the first district in Britain which received a colony from the continent; and that it had frequently changed its masters, by new colonies coming over from time to time, and driving the inhabitants further north. In the midst of all these revolutions it still retained its ancient name (which was so agreeable to its shape and situation), and gave the same name to all the successive tribes by which it was inhabited. Those who possessed it at the time of the first Roman invasion were evidently of Belgic origin, and had come over so lately, that they differed in nothing from their countrymen on the continent. "The inhabitants of Kent (says Cæsar) are the most civilized of all the Britons, and differ but very little in their manners from the Gauls." This great resemblance between the people of Kent and their neighbours on the continent, might be partly owing to the situation of their country, which being nearest to the continent, was most frequented by strangers from thence. It was this situation also which exposed them to the first assaults of the Romans. For Cæsar, in both his expeditions into this island, landed in Kent; and therefore we may conclude, that the Cantii had a great share in the vigorous opposition that was made to his landing, and in the several battles and skirmishes which were fought against him after his landing; particularly, they made a very bold, but unsuccessful attempt, upon his naval camp. The Cantii did not make the same vigorous resistance to the Romans on their next invasion in the reign of Claudius. For Aulus Plautius, the Roman general in that expedition, traversed their country without seeing an enemy; and as they now submitted to the power of Rome without a struggle, so they continued in a state of quiet submission to it to the very last. The situation of Cantium occasioned its being much frequented by the Romans, who generally took their way through it in their marches to and from the continent. Few places in Britain are more frequently mentioned by the Roman writers than Rutupium and Portus Rutupensis, most probably Richborough and Stonar. Rutupium was the same in those times that Dover is in ours; the usual place of embarking for, and landing from, the continent. Before the final departure of the Romans out of Britain, Portus Dubris, now Dover, had become a considerable place, and a well-frequented harbour, where the third iter of Antoninus ends, and from whence they often embarked for Gaul. Portus Lemanus, supposed to be Lime near West Hythe, was also a noted sea-port in these times, and the termination of the fourth iter of Antoninus. Durobrivæ and Durovernum, now Rochester and Canterbury, were both Roman towns and stations, and are often mentioned in the itinerary and other books. Besides these, there were several other Roman stations, towns, and ports in Cantium, which need not be particularly enumerated here. Cantium, in the most perfect state of the Roman government, made a part of the province which was called Flavia Cæsariensis.

CANTO denotes a part or division of a poem, answering to what is otherwise called a *book*. The word is Italian, where it properly signifies *song*. Tasso, Ariosto, and several other Italians, have divided their longer or heroic poems into cantos. In imitation of them,

Scarron

Cantium,
Canto.

Canton. Scarron has also divided his *Gigantomachia*, and Boileau his *Lutrin*, into chants or songs. The like usage has been adopted by some English writers, as Butler, who divides his *Hudibras*, and Dr Garth his *Dispensary*, into cantos. A late translator of part of Virgil's *Æneid* has even subdivided a book of Virgil into several cantos.

CANTO, in the Italian music, signifies a *song*: hence *canto semplice* is where all the notes or figures are equal, and called also *canto fermo*; *canto figurato*, that where the figures are unequal, and express different motions.

CANTO also signifies the treble part of a song: hence *canto concertante*, the treble of the little chorus; *canto ripieno*, the treble of the grand chorus, or that which sings only now and then in particular places. *Canto* signifies the first treble, unless some other word be added to it, as *secondo*; in which case it denotes the second treble.

CANTON, in geography, denotes a small district or country constituting a distinct government: such are the cantons of Switzerland.

CANTON, *Quang-tong*, or Koanton, one of the southern provinces of China; bounded on the north-east by Fokien, on the north by Kiang-si, on the west by Quang-si and the kingdom of Tonking, and every where else by the sea. The country is diversified with hills and plains, and the soil in general so fertile that it produces two crops annually. Besides many of the fruits of Europe, and those common in other parts of the Indies, the province of Canton produces some peculiar to itself. Abundance of valuable aromatic woods are also to be met with in this province, as well as eagle-wood, ebony, &c.; and in the mineral kingdom the province furnishes gold, precious stones, tin, quicksilver, and copper. Silk and sugar are also cultivated here, and pearls are fished up on the coasts; so that every thing which can contribute to the pleasure or convenience of life is to be met with in Canton. "One begins (says F. Premare) to have an idea of China, on entering the river Canton. Both sides of it present large fields of rice which resemble green meadows, and extend beyond the reach of sight. They are intersected by an infinite number of small canals, in such a manner that the barks which pass and repass in them seem at a distance, while the water which carries them is concealed, to glide along the grass. Farther inland the country appears covered with trees and cultivated along the valleys; and the whole scene is interspersed with villages, rural seats, and such a variety of delightful prospects, that one is never tired of viewing them, and regrets to be obliged to pass them so quickly.

All the coasts of this province abound with fish, and furnish vast numbers of crabs, oysters, and tortoises of an immense size. The inhabitants keep a prodigious number of tame ducks, which they hatch in ovens or dunghills, though it does not appear that they borrowed this custom from the Egyptians. The docility of these creatures exceeds what we should be apt at first to imagine. The inhabitants load a number of small barks with them, and carry them in flocks to feed on the sea-shore, where they find shrimps and other animals proper for their nourishment. But though the ducks from the different barks are thus unavoidably mixed together in the day-time, they are easily collected by only beating on a bason, on which

they immediately collect themselves into different flocks, and each returns to its proper bark.

In this province the Chinese have also a method of preserving not only the flesh of their ducks in such a manner that it loses nothing of its original flavour, but their eggs also. The latter operation is performed by covering the eggs with a coat of clay mixed with salt. When mixed in this manner, it seems that the salt has the property of penetrating through the pores of the shell, and thus impregnating the substance in the egg, which it could not do by simple solution of water.

Canton, though it suffered much in the Chinese wars, is at present one of the most flourishing provinces of the empire; and being at a great distance from court, its government is one of the most important. A great number of fortresses, many of which are cities provided with numerous garrisons, have been built along the coasts for the suppression of pirates and robbers; for which purpose also a certain number of troops are kept properly posted in different parts of the province. It is divided into ten districts, which contain as many cities of the first class, and 84 of the second and third. The air in general is warm but healthy, and the people are very industrious. They possess in an eminent degree the talent of imitation, so that if they are only shown any European work they can execute others like it with surprising exactness. The most remarkable cities in the province besides Canton the capital are, 1. Chao-tcheou-fou, chiefly noted for a monastery of the bonzes in its neighbourhood, to which the adjacent country belongs, and the origin of which is traced back for 8 or 900 years. It has under its jurisdiction six cities of the third class; near one of these grows a reed of which several instruments are made, which cannot be distinguished from real ebony. The air of Chao-tcheou-fou, however, is unhealthy; and great numbers of the inhabitants are carried off annually by contagious distempers, which prevail from the middle of October to the beginning of December. 2. Kao-tcheou-fou, situated in a delightful and plentiful country. In the neighbourhood is found a singular kind of stone much resembling marble, on which are natural representations of rivers, mountains, landscapes, and trees. These stones are cut into slabs, and made into tables, &c. Crabs are also caught on the coasts here, which very much resemble those of Europe; but, says M. Grosier, they have this singularity, that when taken out of the water, they become petrified without losing any thing of their natural figure. 3. Kiun-tcheou-fou, the capital of the island of Hai-nan. See HAI-NAN.

CANTON, a large, populous, and wealthy city of China, capital of the province of that name, stands on the banks of the river Taa, or great river, which, near the city, is wide and spacious. The wall of the city is pretty high, and about six or seven miles in circumference, though not more than one-third of the ground is occupied by buildings, the other parts being appropriated to pleasure grounds or to fish ponds. The country is extremely pleasant, and towards the east hilly, so as to command a beautiful prospect of the city and suburbs, the compass of which, together, is about ten miles.

The buildings of Canton are in general low, consisting of one story and a ground floor, which is covered with earth or red tiles in order to keep it cool; but the houses

Canton. of the most respectable merchants and mandarins are comparatively lofty and well built. In different parts of the city and suburbs are joss houses or temples, in which are placed the images worshipped by the Chinese; before whom are placed, at particular seasons, a vast variety of sweetmeats, oranges, great plenty of food ready dressed, and also incense, which is kept perpetually burning.

The streets of Canton are long and narrow, paved with flint stones, adorned at intervals with triumphal arches, which have a pleasing effect, and much crowded with people. On both sides are shops as in London, appropriated to the sale of different commodities; and a kind of awning is extended from house to house, which prevents the sun's rays from incommoding either inhabitants or passengers. At the end of every street is a barrier, which, with the gates of the city, are shut in the evening. In China Street, which is pretty long and considerably wider than the rest, reside merchants; whose trade, so far as respects China, lackered ware, fans, &c. is wholly confined to Europeans. Most of them speak the foreign languages tolerably well, or at least sufficiently intelligible to transact business. Besides these merchants, there is a company of twelve or thirteen, called the *Cohong*; who have an exclusive right by appointment from authority to purchase the cargoes from the different ships, and also to supply them with teas, raw silks, &c. in return. The establishment of the *Cohong*, though injurious to private trade, is admirably well adapted for the security of the different companies with which they traffic; because each individual becomes a guarantee for the whole; so that if one fail, the others consider themselves as responsible.

In Canton there are no carriages; all burdens are carried by porters across their shoulders on bamboos; as are also the principal people in sedan chairs, and the ladies always. The streets of Canton may be traversed from morning till evening without seeing a woman, those excepted who are Tartars, and even these but very seldom.

On the wharf of the river, which is commodious and pleasant, stand the factories of the different European nations, viz. the Dutch, French, Swedes, Danes, English, &c. In those reside the supercargoes belonging to their respective companies, who are appointed to dispose of the cargoes brought to market; to supply the ships with others for Europe in return; and, during their absence, to contract with the merchants for such articles as may be judged necessary for the next fleet. Between the residents of the factories the most perfect cordiality subsists; in each a common and splendid table is kept at the company's expence, and visits are reciprocally exchanged; so that nothing is wanting to make residence at Canton agreeable to an European, but the pleasure naturally resulting from the society of women.

The side of the river next the city is covered with boats, which form a kind of town or streets, in which live the poorer sort of the Chinese, or rather the descendants of the Tartars. Some of the men come on shore in the morning to their respective employments, and in those sampans or boats which are not stationary, the women and also the men carry passengers from place to place in the same manner as is done by

wherries on the Thames. On this river live many thousand souls who never were permitted to come on shore; whose only habitation is their boat; in which they eat, drink, sleep, carry on many occupations, keep ducks, &c. and occasionally a hog.

The manufactures of Canton are principally carried on in the suburbs; though it has been frequently supposed that they were confined to the city; and this, by some writers, has been given as a reason why Europeans are not permitted to enter within the gates. But this is a mistake; and perhaps the true reason for this very singular restraint is, that the houses in which they keep their women are chiefly within the city.

At Wampoa, a large commodious place for anchorage, and which is about 12 or 14 miles from Canton, the European vessels lie and unload their cargoes, which are transmitted by lighters to the factories; and by the same conveyance receive their respective freights. Between this place and the city are three stoppo, or custom-houses, at which the boats passing and repassing are obliged to stop, and undergo with its passengers an examination, in order to prevent smuggling. The lighters just mentioned, and also the captain's pinnace, are, however, excepted; the former having proper officers on board for the purpose, and the latter being narrowly watched and examined at the landing.

The weather at Canton is, in summer, extremely hot; and in the months of December, January, and February, cold: the country is nevertheless pleasant and healthful, abounding with all the necessaries and delicacies of life, which may be procured on terms much cheaper than in Europe. The number of inhabitants has been estimated at one million; but later calculations have made the number considerably less. N. Lat. 23. 30. E. Long. 113. 20.

CANTON (John), an ingenious natural philosopher, was born at Stroud, in Gloucestershire, in 1718; and was placed, when young, under the care of a Mr Davis, of the same place, a very able mathematician, with whom, before he had attained the age of nine years, he had gone through both vulgar and decimal arithmetic. He then proceeded to the mathematics, and particularly to algebra and astronomy, wherein he had made a considerable progress, when his father took him from school, and put him to learn his own business, which was that of a broad cloth weaver. This circumstance was not able to damp his zeal for the acquisition of knowledge. All his leisure time was devoted to the assiduous cultivation of astronomical science; and, by the help of the Caroline tables, annexed to "Wing's Astronomy," he computed eclipses of the moon and other phenomena. His acquaintance with that science he applied likewise to the constructing of several kinds of dials. But the studies of our young philosopher being frequently pursued to very late hours, his father, fearing that they would injure his health, forbade him the use of a candle in his chamber any longer than for the purpose of going to bed, and would himself often see that his injunction was obeyed. The son's thirst of knowledge was, however, so great, that it made him attempt to evade the prohibition, and to find means of secreting his light till the family had retired to rest, when he rose to prosecute undisturbed his favourite pursuits. It was during this prohibition, and at these hours,

Canton. hours, that he computed, and cut upon stone, with no better an instrument than a common knife, the lines of a large upright sun-dial, on which, besides the hour of the day, was shown the rising of the sun, his place in the ecliptic, and some other particulars. When this was finished, and made known to his father, he permitted it to be placed against the front of his house, where it excited the admiration of several gentlemen in the neighbourhood, and introduced young Mr Canton to their acquaintance, which was followed by the offer of the use of their libraries. In the library of one of these gentlemen, he found "Martin's Philosophical Grammar," which was the first book that gave him a taste for natural philosophy. In the possession of another gentleman, a few miles from Stroud, he first saw a pair of globes; an object that afforded him uncommon pleasure, from the great ease with which he could solve those problems he had hitherto been accustomed to compute. The dial was beautified a few years ago at the expence of the gentlemen at Stroud, several of whom had been his school-fellows, and who continued still to regard it as a very distinguished performance. Among other persons with whom he became acquainted in early life, was the late reverend and ingenious Dr Henry Miles of Tooting, a learned and respectable member of the Royal Society, and of approved eminence in natural knowledge. This gentleman, perceiving that Mr Canton possessed abilities too promising to be confined within the narrow limits of a country town, prevailed on his father to permit him to come to London. Accordingly he arrived at the metropolis March 4, 1737, and resided with Dr Miles at Tooting till the 6th of May following; when he articulated himself, for the term of five years, as a clerk to Mr Samuel Watkins, master of the academy in Spital-square. In this situation, his ingenuity, diligence, and good conduct, were so well displayed, that on the expiration of his clerkship in May 1742, he was taken into partnership with Mr Watkins for three years; which gentleman he afterwards succeeded in Spital-square, and there continued during his whole life. In 1744, he married Penelope, the eldest daughter of Mr Thomas Colbrooke, and niece to James Colbrooke, Esq; banker in London.

Towards the end of 1745, electricity, which seems early to have engaged Mr Canton's notice, received a very capital improvement by the discovery of the famous Leyden Phial. This event turned the thoughts of most of the philosophers of Europe to that branch of natural philosophy; and our author, who was one of the first to repeat and to pursue the experiment, found his assiduity and attention rewarded by many capital discoveries. Towards the end of 1749, he was concerned with his friend, the late Mr Benjamin Robins, in making experiments in order to determine to what height rockets may be made to ascend, and at what distance their light may be seen. In 1750 was read at the Royal Society, Mr Canton's "Method of making artificial magnets, without the use of, and yet far superior to, any natural ones." This paper procured him the honour of being elected a member of the Society, and the present of their gold medal. The same year he was complimented with the degree of M. A. by the university of Aberdeen; and, in 1751, was chosen one of the council of the Royal Society.

Nº 64.

Canton. In 1752, our philosopher was so fortunate as to be the first person in England, who, by attracting the electric fire from the clouds during a thunder-storm, verified Dr Franklin's hypothesis of the similarity of lightning and electricity. Next year, his paper intitled, "Electrical Experiments, with an attempt to account for their several Phenomena," was read at the Royal Society. In the same paper Mr Canton mentioned his having discovered, by a great number of experiments, that some clouds were in a positive, and some in a negative, state of electricity. Dr Franklin, much about the same time, made the like discovery in America. This circumstance, together with our author's constant defence of the doctor's hypothesis, induced that excellent philosopher, immediately on his arrival in England, to pay Mr Canton a visit, and gave rise to a friendship which ever after continued without interruption or diminution. In the "Lady's Diary for 1756," our author answered the prize question that had been proposed in the preceding year. The question was, "How can what we call the shooting of stars be best accounted for; what is the substance of this phenomenon; and in what state of the atmosphere doth it most frequently show itself?" The solution, though anonymous, was so satisfactory to his friend, Mr Thomas Simpson, who then conducted that work, that he sent Mr Canton the prize, accompanied with a note, in which he said, he was sure that he was not mistaken in the author of it, as no one besides, that he knew of, could have answered the question. Our philosopher's next communication to the public, was a letter in the "Gentleman's Magazine for September 1759," on the electrical properties of the tourmalin, in which the laws of that wonderful stone are laid down in a very concise and elegant manner. On December 13th, in the same year, was read at the Royal Society, "An attempt to account for the regular diurnal variation of the Horizontal Magnetic Needle; and also for its irregular variation at the time of an Aurora Borealis." A complete year's observations of the diurnal variations of the needle are annexed to the paper. On Nov. 5. 1761, our author communicated to the Royal Society an account of the Transit of Venus, June 6. 1761, observed in Spital-square. Mr Canton's next communication to the Society, was a letter addressed to Dr Benjamin Franklin, and read Feb. 4. 1762, containing some remarks on Mr Delaval's electrical experiments. On Dec. 16. in the same year, another curious addition was made by him to philosophical knowledge, in a paper, intitled, "Experiments to prove that water is not incompressible." These experiments are a complete refutation of the famous Florentine experiment, which so many philosophers have mentioned as a proof of the incompressibility of water. On St Andrew's day 1763, our author was the third time elected one of the council of the Royal Society; and on Nov. 8. in the following year, were read, before that learned body, his farther "Experiments and observations on the compressibility of water, and some other fluids." The establishment of this fact, in opposition to the received opinion, formed on the hasty decision of the Florentine academy, was thought to be deserving of the Society's gold medal. It was accordingly moved for in the council of 1764; and after several invidious delays, which terminated

5

much

Canton
||
Cantyre.

much to the honour of Mr Canton, it was presented to him Nov. 30. 1765.

The next communication of our ingenious author to the Royal Society, which we shall take notice of in this place, was on Dec. 22. 1768, being "An easy method of making a Phosphorus that will imbibe and emit light like the Bolognian stone; with experiments and observations." When he first showed to Dr Franklin the instantaneous light acquired by some of this phosphorus from the near discharge of an electrified bottle, the doctor immediately exclaimed, "And God said, let there be light, and there was light." The dean and chapter of St Paul's having, in a letter to the president, dated March 6. 1769, requested the opinion of the Royal Society relative to the best and most effectual method of fixing electrical conductors to preserve that cathedral from damage by lightning, Mr Canton was one of the committee appointed to take the letter into consideration, and to report their opinion upon it. The gentlemen joined with him in this business were, Dr Watson, Dr Franklin, Mr Delaval, and Mr Wilton. Their report was made on the 8th of June following; and the mode recommended by them has been carried into execution. The last paper of our author's, which was read before the Royal Society, was on Dec. 21. 1769; and contained "Experiments to prove that the Luminousness of the Sea arises from the putrefaction of its animal substances." In the account now given of his communications to the public, we have chiefly confined ourselves to such as were the most important, and which threw new and distinguished light on various objects in the philosophical world. Besides these, he wrote a number of papers, both in earlier and in later life, which appeared in several different publications, and particularly in the Gentleman's Magazine.

The close and sedentary life of Mr Canton, arising from an unremitted attention to the duties of his profession, and to the prosecution of his philosophical enquiries and experiments, probably contributed to shorten his days. The disorder into which he fell, and which carried him off, was a dropsy. His death happened on March 22. 1772, in the 54th year of his age.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment; the town where they are quartered being divided into as many cantons as there are regiments.

CANTRED, or CANTREF, signifies an hundred villages. It is a British word, compounded of the adjective *cant*, i. e. hundred; and *tref*, a town or village. In Wales some of the counties are divided into cantreds, as in England into hundreds.

CANTYRE, (from *Cantierre*, signifying a "headland"); the southern division of the shire of Argyle in Scotland. It is a peninsula, stretching 37 miles from north to south, and seven miles in breadth. It is mostly plain, arable, and populous; inhabited promiscuously by Highlanders and Lowlanders, the latter being invited to settle in this place by the Argyle family, that the lands might be the better cultivated. It gives the title of *marquis* to the duke, and is by Lochfyn divided from Argyle Proper. This loch is an inlet from the sea, about 60 miles in length and four in breadth, affording heretofore an excellent herring-fishery. There

VOL. IV. PART I.

are many paltry villages in this country, but no town of any consequence except Campbeltown.

Cantyre was granted to the house of Argyle after a suppression of a rebellion of the Macdonalds of the Isles (and it is supposed of this peninsula) in the beginning of the last century, and the grant was afterwards ratified by parliament. The ancient inhabitants were the Mac-donalds, Mac-eachrans, Mac-kays, and Mac-maths.

Mull of CANTYRE, the south cape or promontory of the peninsula. There is here a light-house 235 feet above the sea at high water, situated on the rocks called the *Merchants*, Lat. 55. 22. Long. 5. 42. west of London. The sound of Isla from the light-house bearing, by the compass, N. by E. distant 27 miles; the south end of Isla N. N. W. distant 25 miles; the north end of Rathlin island, N. W. by W. one half W.; the Maiden Rocks, S. by W. one half W. distant 14 miles; Copland light, S. by W. one half W. distant 31 miles. The lanthorn is seen from N. N. E. 1-4th E. from S. by W. 1-4th W. and intermediate points of the compass N. of these two points.

CANTZ, a town of Silesia in Germany. E. Long. 16. 36. N. Lat. 51. 6.

CANVAS, in commerce, a very clear unbleached cloth of hemp, or flax, wove regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals or squares.

CANVAS is also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover womens stays, also to stiffen mens clothes, and to make some other of their wearing apparel, &c.

CANVAS is also used among the French for the model or first words whereon an air or piece of music is composed, and given to a poet to regulate and finish. The canvas of a song contains certain notes of the composer, which show the poet the measure of the verses he is to make. Thus Du Lot says, he has canvas for ten sonnets against the muses.

CANVAS is also the name of a cloth made of hemp, and used for ship-sails.

CANVAS, among painters, is the cloth on which they usually draw their pictures; the canvas being smoothed over with a slick-stone, then sized, and afterwards whited over, makes what the painters call their *primed cloth*, on which they draw their first sketches with coal or chalk, and afterwards finish with colours.

CANUSIUM (anc. geog.), a town of Apulia, on the right or south side of the Aufidus, to the west of Cannæ; whither the Romans fled after the defeat sustained there. It was famous for its red shining wool; whence those who wore clothes made of it were called *Canusinati*. Now called CANOSA; which see.

CANUTE, the first Danish king of England after Ironside. He married Emma widow of king Ethelred; and put to death several persons of quality who stood in his way to the crown. Having thus settled his power in England, he made a voyage to his other kingdom of Denmark, in order to resist the attacks of the king of Sweden; and he carried along with him a great body of the English under the command of the earl of Godwin. This nobleman had here an opportunity of performing a service by which he both reconciled the

R

king's

Cantyre
||
Canute.

Canute. king's mind to the English nation, and, gaining to himself the friendship of his sovereign, laid the foundation of that immense fortune which he acquired to his family. He was stationed next the Swedish camp; and, observing a favourable opportunity which he was obliged suddenly to seize, he attacked the enemy in the night, drove them suddenly from their trenches, threw them into disorder, pursued his advantage, and obtained a decisive victory over them. Next morning, Canute, seeing the English camp entirely abandoned, imagined that these disaffected troops had deserted to the enemy; and he was agreeably surprised to find that they were at that time engaged in pursuit of the discomfited Swedes. He was so pleased with this success, and the manner of obtaining it, that he bestowed his daughter in marriage upon Godwin, and treated him ever after with the most entire confidence and regard.

In another voyage which he afterwards made to Denmark, Canute attacked Norway, and expelled the just but unwarlike Olaus from his kingdom, of which he kept possession till the death of that prince. He had now by his conquests and valour attained the utmost height of his ambition; and having leisure from wars and intrigues, he felt the unsatisfactory nature of all human enjoyments; and, equally weary of the glory and turmoils of this life, he began to cast his view towards that future existence which is so natural for the human mind, whether satiated by prosperity or disgusted with adversity, to make the object of its attention. Unfortunately the spirit which prevailed in that age gave a wrong direction to his devotion; and, instead of making atonement to those whom he had formerly injured by his acts of violence, he entirely employed himself in those exercises of piety which the monks represented as most meritorious. He built churches; he endowed monasteries; he enriched ecclesiastics; and he bestowed revenues for the support of chantries at Affington and other places, where he appointed prayers to be said for the souls of those who had there fallen in battle against him. He even undertook a pilgrimage to Rome, where he sojourned a considerable time; and, besides obtaining from the Pope some privileges for the English school erected there, he engaged all the princes through whose dominions he was obliged to pass, to desist from those heavy impositions and tolls which they were accustomed to exact from the English pilgrims. By this spirit of devotion, no less than by his equitable and politic administration, he gained in a good measure the affections of his subjects.

Canute, who was the greatest and most powerful prince of his time, sovereign of Denmark and Norway as well as of England, could not fail to meet with adulation from his courtiers; a tribute which is liberally paid even to the meanest and weakest of princes. Some of his flatterers breaking out one day in admiration of his grandeur, exclaimed, that every thing was possible for him: upon which the monarch, it is said, ordered a chair to be set on the sea-shore while the tide was making; and, as the waters approached, he commanded them to retire, and to obey the voice of him who was lord of the ocean. He feigned to sit some time in expectation of their submission; but when the sea still advanced towards him, and began to wash him with its billows, he turned to his courtiers, and remarked to them, That every creature in the universe

was feeble and impotent, and that power resided with one Being alone, in whose hands were all the elements of nature, who could say to the ocean, "Thus far shalt thou go, and no farther," and who could level with his nod the most towering piles of human pride and ambition. From that time, it is said, he never would wear a crown. He died in the 20th year of his reign; and was interred at Winchester, in the old monastery.

CANZONE, in music, signifies, in general, a song, where some little fugues are introduced: but it is sometimes used for a sort of Italian poem, usually pretty long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as cantata: if placed in any part of a sonata, it implies the same meaning as *allegro*, and only denotes that the part to which it is prefixed is to be played or sung in a brisk and lively manner.

CANZONETTA, a diminutive of canzone, denoting a little short song. The canzonette neapolitane has two strains, each whereof is sung twice over, as the vaudevilles of the French: The canzonette siciliane is a species of jig, the measure whereof is usually twelve eighths, and six eighths, and sometimes both, as rondeaus.

CAORLO, a small island in the gulf of Venice, on the coast of Friuli, 20 miles south-west of Aquileia, subject to Venice. It has a town of the same name, with a bishop's see.

CAOUTCHOUC, ELASTIC RESIN, or *India Rubber*, a substance produced from the syringe-tree of Cayenne and other parts of South America, and possessed of the most singular properties. No substance is yet known which is so pliable, and at the same time so elastic; and it is farther a matter of curiosity, as being capable of resisting the action of very powerful menstrua. From the account of M. de la Condamine, we learn, that this substance oozes out, under the form of a vegetable milk, from incisions made in the tree; and that it is gathered chiefly in time of rain, because, though it may be collected at all times, it flows then most abundantly. The means employed to inspissate and indurate it, M. de la Borde says, are kept a profound secret. M. Bomare, and others, affirm, that it thickens and hardens gradually by being exposed to the air; and as soon as it acquires a solid consistence, it manifests a very extraordinary degree of flexibility and elasticity. Accordingly the Indians make boots of it, which water cannot penetrate, and which, when smoked, have the appearance of real leather. Bottles are also made of it, to the necks of which are fastened hollow reeds, so that the liquor contained in them may be squirted through the reeds or pipes by pressure. One of these filled with water is always presented to each of the guests at their entertainments, who never fail to make use of it before eating. This whimsical custom led the Portuguese in that country to call the tree that produces this resin *pao di xirringa*, and hence the name of *seringat* is given both to the tree and to its resinous production. Flambeaux, an inch and a half in diameter, and two feet long, are likewise made of this resin, which give a beautiful light, have no bad smell, and burn twelve hours. A kind of cloth is also prepared from it, which

Canzone
||
Caout-
chouc.

Caout-
chouc.

the inhabitants of Quito apply to the same purposes as our oil-cloth and sail-cloth. It is formed, in fine, by means of moulds, into a variety of figures for use and ornament; and the process is said to be thus:—The juice, which is obtained by incision, is spread over pieces of clay formed into the desired shape; and as fast as one layer is dry, another is added, till the vessel be of the proper thickness: the whole is then held over a strong smoke of vegetables on fire, whereby it hardens into the texture and appearance of leather; and before the finishing, while yet soft, is capable of having any impression made on the outside, which remains ever after. When the whole is done, the inside mould is picked out.

Ever since this resin has been known in Europe, its chemical qualities and other interesting properties have been very diligently investigated. In particular, it has been endeavoured to discover some method of dissolving it in such a manner that it would assume different figures with equal ease as when in its original state of milk. In the memoirs of the academy of sciences for 1768, we have an account of several attempts for this purpose, and how it may be effected. —The state of vegetable milk in which the caoutchouc resin is found when it comes from the tree, led Mr Macquer to imagine that it was composed of an oil and a watery matter. From its wanting aromatic flavour, from its little volatility, and from its being incapable of solution in spirit of wine, he concluded that the oil which entered its composition was not an essential, but a fatty, one. Hence he thought it probable that it passed from a fluid to a solid form by the evaporation of the watery part, and that the oily solvents would reduce it to a soft state. The first trials he made for dissolving it were with linseed oil, essence of turpentine, and several others. But all he could obtain by means of these menstrua was a viscid substance incapable of being hardened, and totally void of elasticity. The rectified essential oil of turpentine was employed seemingly with greater success. To separate from this menstruum the caoutchouc which it had dissolved, Mr Macquer added spirit of wine: but the consequence was, that part only of the oil united with the spirit; the rest remaining obstinately attached to the resin which it had dissolved, and thus preventing it from assuming a solid consistence. The author next endeavoured to dissolve it by means of heat in Papin's digester. But neither water, nor spirit of wine, although in this way capable of dissolving the hardest bones, could produce any other effect upon it than to render it more firm than before. After this, he tried what effect the milky juice of other vegetables would have upon it. He used several kinds, particularly that of the fig. But, in this way, he could obtain no solution. From the great volatility of ether, he was next induced to try it as a menstruum; and, for this purpose, he prepared some with great attention. The caoutchouc, cut into little bits, and put into a proper vessel with as much ether as was sufficient to cover it, was perfectly dissolved without any other heat than that of the atmosphere. This solution was transparent and of an amber colour. It still preserved the smell of ether, but mixed with the disagreeable odour of the caoutchouc, and it was a little less fluid than pure ether. Upon its being thrown into water, no milky liquor was produ-

Caout-
chouc.

ced; but there arose to the surface a solid membrane which possessed the great elasticity and other peculiar properties of the caoutchouc. He observes, however, that two pints of the best ether, obtained by rectifying eight or ten pints of the common ether by a gentle heat, must be used, in order to the success of the operation.—The distinguishing properties of this substance, viz. its solidity, flexibility, and elasticity, and its quality of resisting the action of aqueous, spirituous, saline, oily, and other common solvents, render it extremely fit for the construction of tubes, catheters, and other instruments, in which these properties are wanted. In order to form this resin into small tubes, M. Macquer prepared a solid cylindrical mould of wax, of the desired size and shape; and then dipping a pencil into the ethereal solution of the resin, daubed the mould over with it, till he had covered it with a coat of resin of a sufficient thickness. The whole piece is then thrown into boiling water; by the heat of which the wax is soon melted, and rises to the surface, leaving the resinous tube completely formed behind.

A resin similar to this was some years ago discovered by M. Poivre, in the isle of France; and there are various milky juices extracted from trees in America and elsewhere, which by previous mixtures and preparations are formed into an elastic resin, but of an inferior quality to that of Cayenne: such, for instance, are the juices obtained from the *Cecropia peltata*, the *Ficus religiosa* and *indica*, &c.

Of the genuine trees, those growing along the banks of the river of the Amazons are described by M. Condamine as attaining a very great height, being at the same time perfectly straight, and having no branches except at top, which is but small, covering no more than a circumference of ten feet. Its leaves bear some resemblance to those of the *manioc*: they are green on the upper part, and white beneath. The seeds are three in number, and contained in a pod consisting of three cells, not unlike those of the *ricinus* or *palma Christi*; and in each of them there is a kernel, which being stripped and boiled in water produces a thick oil or fat, answering the purposes of butter in the cookery of that country.

A method of dissolving this elastic gum without ether, for the purposes of a varnish or the like, is as follows: Take one pound of the spirit of turpentine, and a pound of the gum cut into very small pieces; pour the turpentine into a long-necked matrafs, which must be placed in a sand-bath; throw in the gum, not all at once, but by little and little according as it is perceived to dissolve: When it is entirely dissolved, pour into the matrafs a pint of nut or linseed oil, or oil of poppies, rendered desiccative in the usual manner with litharge: Then let the whole boil for a quarter of an hour, and the preparation is finished. This would make an excellent varnish for air-balloons, were it not so expensive on account of the price of the gum.—Another method, invented by Mr Baldwin, is as follows. Take any quantity of the caoutchouc, as two ounces avoirdupois: cut it into small bits with a pair of scissors. Put a strong iron ladle (such as plumbers or glaziers melt their lead in) over a common pit-coal or other fire. The fire must be gentle, glowing, and without smoke. When the ladle is hot, much be-

Caout-
chouc,
Cap.

low a red heat, put a single bit into the ladle. If black smoke issues, it will presently flame and disappear: or it will evaporate without flame: the ladle is then too hot. When the ladle is less hot, put in a second bit, which will produce a white smoke. This white smoke will continue during the operation, and evaporate the caoutchouc: therefore no time is to be lost; but little bits are to be put in, a few at a time, till the whole are melted. It should be continually and gently stirred with an iron or brass spoon. Two pounds, or one quart, of the best drying oil (or of raw linseed oil which, together with a few drops of neats foot oil, has stood a month, or not so long, on a lump of quicklime, to make it more or less drying) is to be put into the melted caoutchouc, and stirred till hot: and the whole poured into a glazed vessel, through a coarse gauze, or fine sieve. When settled and clear, which will be in a few minutes, it is fit for use, either hot or cold.

The Abbé Clavigero informs us, that the elastic gum is called by the Mexicans *Olin* or *Olli*, and by the Spaniards of that kingdom *Ule*: That it distils from the *Olquahuitl*, which is a tree of moderate size; the trunk of which is smooth and yellowish, the leaves pretty large, the flowers white, and the fruit yellow and rather round, but angular; within which there are kernels as large as filberds, and white, but covered with a yellowish pellicle: That the kernel has a bitter taste, and the fruit always grows attached to the bark of the tree: That when the trunk is cut, the *Ule* which distils from it is white, liquid, and viscous; afterwards it becomes yellow; and lastly of a leaden colour, though rather blacker, which it always retains. The tree, he adds, is very common in the kingdom of Guatimala.

As to the genus of this tree, it does not seem to be yet ascertained. Aublet, in his *Histoire des Plantes de la Guiane* (p. 871.), describes the tree, the fruit, and manner of collecting the juice; but never saw the flower: he calls it, however, *Hevea Guianensis*. In Jacquin's *America*, it is called *Echites corymbosa*. The younger Linnæus, in his *Supplementum Plantarum* (p. 422), names it *Jatropha elastica*; but acknowledges that he only gives it this name from the structure of the fruit having most resemblance to that genus, his dry species wanting the flowers.

Of the above gum, it is said, the Chinese make elastic rings for lascivious purposes.—Among us it is used by surgeons for injecting liquids, and by painters for rubbing out black-lead pencil marks, &c.

CAP, a part of dress made to cover the head, much in the figure thereof.

The use of caps and hats is referred to the year 1449, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began to take place of the hoods, or chaperons, that had been used till then. When the cap was of velvet, they called it *mortier*; when of wool, simply *bonnet*. None but kings, princes, and knights, were allowed the use of the mortier. The cap was the head-dress of the clergy and graduates. Pasquier says, that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off as an incumbrance, left the round cap an easy commodious cover for the head; which round cap being af-

terwards assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman, called Patrouillet: he adds, that the giving of the cap to the students in the universities, was to denote, that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the ancient Romans, who gave a *pileus*, or cap, to their slaves, in the ceremony of making them free: whence the proverb, *Vocare servos ad pileum*. Hence, also, on medals, the cap is the symbol of liberty, whom they represent holding a cap in her right hand, by the point.

The Romans were many ages without any regular covering for the head: when either the rain or sun was troublesome, the lappet of the gown was thrown over the head; and hence it is that all the ancient statues appear bareheaded, excepting sometimes a wreath, or the like. And the same usage obtained among the Greeks, where, at least during the heroic age, no caps were known. The sort of caps or covers of the head in use among the Romans on divers occasions, were the *pitra*, *pileus*, *cucullus*, *galerus*, and *palliolum*; the differences between which are often confounded by ancient as well as modern writers.

The French clergy wear a shallow kind of cap, called *calotte*, which only covers the top of the head, made of leather, fatten, worsted, or other stuff. The red cap is a mark of dignity allowed only to those who are raised to the cardinalate. The secular clergy are distinguished by black leathern caps, the regulars by knit and worsted ones.

Churchmen, and the members of universities, students in law, physic, &c. as well as graduates, wear square caps. In most universities doctors are distinguished by peculiar caps, given them in assuming the doctorate. Wickliff calls the canons of his time *bisurcati*, from their caps. Pasquier observes, that, in his time, the caps worn by the churchmen, &c. were called square caps; though, in effect, they were round yellow caps.

The Chinese have not the use of the hat, like us; but wear a cap of a peculiar structure, which the laws of civility will not allow them to put off: it is different for the different seasons of the year: that used in summer is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with fatten: to this is added, at top, a large lock of red silk, which falls all round as low as the bottom; so that, in walking, the silk fluctuating regularly on all sides, makes a graceful appearance: sometimes, instead of silk, they use a kind of bright red hair, the lustre whereof no weather effaces. In winter they wear a plush cap, bordered with martlet's or fox's skin; as to the rest, like those for the summer. These caps are frequently fold for eight or ten crowns; but they are so short, that the ears are exposed.

The cap is sometimes used as a mark of infamy; in Italy the Jews are distinguished by a yellow cap; at Lucca by an orange one. In France, those who had been bankrupts were obliged ever after to wear a green cap, to prevent people from being imposed on in any future commerce. By several arrets in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their green cap, their protection should

Cap.

Cap
||
Capell.

Capell.

should be null, and their creditors impowered to cast them into prison: but the sentence is not now executed.

CAP of Maintenance, one of the regalia, or ornaments of state belonging to the kings of England, before whom it was carried at the coronation and other great solemnities. Caps of maintenance are also carried before the mayors of the several cities in England.

CAP, in ship building, a strong, thick, block of wood, used to confine two masts together, when one is erected at the head of the other in order to lengthen it. It is for this purpose furnished with two holes perpendicular to its length and breadth, and parallel to its thickness: one of these is square, and the other round; the former being solidly fixed upon the upper end of the lower mast, whilst the latter receives the mast employed to lengthen it, and secures it in this position.

CAPACIO, an episcopal town of Italy, in the kingdom of Naples, and in the hither Principato. E. Long. 15. 18. N. Lat. 40. 40.

CAPACITY, in a general sense, an aptitude or disposition to hold or retain any thing.

CAPACITY, in geometry, is the solid contents of any body; also our hollow measure for wine, beer, corn, salt, &c. are called *measures of capacity*.

CAPACITY, in law, the ability of a man, or body politic, to give or take lands or other things, or sue actions.

Our law allows the king two capacities; a natural, and a political: in the first, he may purchase lands to him and his heirs; in the second, to him and his successors. The clergy of the church of England have the like.

CAPARASON, or *CAPARISON*, the covering or clothing laid over an horse; especially a sumpter horse, or horse of state. The word is Spanish, being an augmentative of *cape*, *caput*, *head*.

Anciently the caparasons were a kind of iron armour, wherewith horses were covered in battle.

CAPE, in geography, an high land running out with a point into the sea, as Cape-Nord, Cape-Horn, the Cape of Good Hope, &c.

CAPE-Elk. See *CERVUS*.

CAPE-Breton. See *BRETON*.

CAPE-Coast Castle. See *COAST*.

CAPE of Good Hope. See *GOOD HOPE*.

CAPE-Verd. See *VERD*.

CAPELL (Edward), a gentleman well known by his indefatigable attention to the works of Shakespeare, was a native of the county of Suffolk, and received his education at the school of St Edmund's Bury. In the dedication of his edition of Shakespeare, in 1768, to the duke of Grafton, he observes, that "his father and the grandfather of his grace were friends, and to the patronage of the deceased nobleman he owed the leisure which enabled him to bestow the attention of 20 years on that work." The office which his grace bestowed on Mr Capell was that of deputy-inspector of the plays, to which a salary is annexed of 200l. a-year. So early as the year 1745, as Mr Capell himself informs us, shocked at the licentiousness of Hammer's plan, he first projected an edition of Shakespeare, of the strictest accuracy, to be collated and published,

in due time, *ex fide codicum*. He immediately proceeded to collect and compare the oldest and scarcest copies; noting the original excellencies and defects of the rarest quartos, and distinguishing the improvements or variations of the first, second, and third folios: and, after many years labour, produced a very beautiful small octavo, in 10 volumes, with "an Introduction." There is not, the authors of the Monthly Review observe, among the various publications of the present literary æra, a more singular composition than that "Introduction." In style and manner, it is more obsolete and antique than the age of which it treats. It is Lord Herbert of Cherbury, walking the new pavement in all the trappings of romance; but, like Lord Herbert, it displays many valuable qualities accompanying this air of extravagance, much sound sense, and appropriate erudition. In the title-page of "Mr William Shakespeare his Comedies, Histories, and Tragedies," it was also announced and promulgated, "Whereunto will be added, in some other volumes, notes critical and explanatory, and a body of various readings entire." "The Introduction" likewise declared, that these "notes and various readings" would be accompanied with another work, disclosing the sources from which Shakespeare "drew the greater part of his knowledge in mythological and classical matters, his fable, his history, and even the seeming peculiarities of his language—to which," says Mr Capell, "we have given for title, The School of Shakespeare." Nothing surely could be more properly conceived than such designs, nor have we ever met with any thing better grounded on the subject of "the learning of Shakespeare" than what may be found in the long note to this part of Mr Capell's Introduction. It is more solid than even the popular "Essay" on this topic. Certain quaintnesses of style, and peculiarities of printing and punctuation, attended the whole of this publication. The outline, however, was correct; and the critic, with unremitting toil, proceeded in his undertaking. But while he was diving into the classics of Caxton (to continue the Reviewers account), and working his way underground, like the river Mole, in order to emerge with all his glories; while he was looking forward to his triumphs; certain other active spirits went to work upon his plan, and, digging out the promised treasures, laid them prematurely before the public, defeating the effect of our critic's discoveries by anticipation. Steevens, Malone, Farmer, Percy, Reed, and a whole host of literary ferrets, burrowed into every hole and corner of the warren of modern antiquity, and over-ran all the country, whose map had been delineated by Edward Capell. Such a contingency nearly staggered the steady and unshaken perseverance of our critic, at the very eve of the completion of his labours, and as his editor informs us—for, alas! at the end of near 40 years, the publication was posthumous, and the critic himself no more!—he was almost determined to lay the work wholly aside. He persevered, however, by the encouragement of some noble and worthy persons: and to such their encouragement, and his perseverance, the public was, in 1783, indebted for three large volumes in 4to, under the title of "Notes and various readings of Shakespeare; together with the School of Shakespeare, or Extracts from divers English Books,

Capella
||
Caperolans.

Books, that were in print in the Author's time; evidently showing from whence his several Fables were taken, and some parcel of his Dialogue. Also farther Extracts, which contribute to a due understanding of his Writings, or give a light to the History of his Life, or to the Dramatic History of his Time. By Edw. Capell."—Besides the works already mentioned, Mr Capell was the editor of a volume of ancient poems called "Prolusions;" and the alteration of "Antony and Cleopatra," as acted at Drury Lane in 1758. He died January 24. 1781.

CAPELLA, in astronomy, a bright fixed star in the left shoulder of the constellation Auriga.

CAPELLE, a town of France, in Picardy, and in the Tierache, eight miles from Guise. It was taken by the Spaniards in 1636; but retaken the year after. E. Long. 3. 59. N. Lat. 49. 58.

CAPELLETS, in farriery. See there, § xxxvi. 4.

CAPELLUS (Lewis), an eminent French Protestant divine, born at Sedan in Champagne about the year 1579. He was author of some learned works; but is chiefly known from the controversy he engaged in with the younger Buxtorf concerning the antiquity of Hebrew points, which Capellus undertook to disprove. His *Critica Sacra* was also an elaborate work, and excited some disputes. He died in 1658, having made an abridgement of his life in his work *De gente Capellori*.

CAPER, in botany. See CAPPARIS.

CAPER also denotes a vessel used by the Dutch for cruising and taking prizes from the enemy; in which sense, caper amounts to the same with privateer. Capers are commonly double-officered, and crowded with hands even beyond the rates of ships of war, because the thing chiefly in view is boarding the enemies.

CAPERNAUM, a city celebrated in the gospels, being the place where Jesus usually resided during the time of his ministry. This city is no where mentioned in the Old Testament under this or any other name like it; and therefore it is not improbable that it was one of those towns which the Jews built after their return from the Babylonish captivity. It stood on the sea-coast, *i. e.* on the coast of the sea of Galilee, in the borders of Zebulon and Nephtalim (Matt. iv. 15.), and consequently towards the upper part thereof. It took its name no doubt from an adjacent spring of great repute for its clear and limpid waters; and which, according to Josephus, was by the natives called *Capernaum*. As this spring might be some inducement to the building the town in the place where it stood, so its being a convenient wafting place from Galilee to any part on the other side of the sea, might be some motive to our Lord for his moving from Nazareth, and making this the place of his most constant residence. Upon this account Capernaum was highly honoured, and said by our Lord himself to be *exalted unto heaven*; but because it made no right use of this signal favour, it drew from him the severe denunciation, that it should be brought down to hell (Matt. xi. 23.), which has certainly been verified: for, as Dr Wells observes, so far is it from being the metropolis of all Galilee, as it once was, that it consisted long since of no more than six poor fishermen's cottages, and may perhaps be now totally desolate.

CAPEROLANS, a congregation of religious in

Italy, so called from Peter Caperole their founder, in the 15th century.

The Milanese and Venetians being at war, the enmity occasioned thereby spread itself to the very cloysters. The superiors of the province of Milan, of minor brothers, which extended itself as far as the territories of the republic of Venice, carried it so haughtily over the Venetians, that those of the convent of Brescia resolved to shake off a yoke which was grown insupportable to them. The superiors, informed of this, expelled out of the province those whom they considered as the authors of this design; the principal of whom were Peter Caperole, Matthew de Tharvillo and Bonaventure of Brescia. Peter Caperole, a man of an enterprising genius, found means to separate the convents of Brescia, Bergamo, and Cremona, from the province of Milan, and subject them to the conventuals. This occasioned a law-suit between the vicar-general and these convents, which was determined in favour of the latter; and these convents, in 1475, by the authority of Pope Sixtus IV. were erected into a distinct vicariate, under the title of that of *Brescia*. This not satisfying the ambition of Caperole, he obtained, by the interposition of the Doge of Venice, that this vicariate might be erected into a congregation, which was called from him *Caperolans*. This congregation still subsists in Italy, and is composed of 24 convents, situated in Brescia, Bergamo, and Cremona.

CAPERQUIN, a town of Ireland, in the county of Waterford, and province of Munster, situated on the river Blackwater. W. Long. 7. 50. N. Lat. 52. 5.

CAPESTAN, a town of France, in Lower Languedoc, in the diocese of Narbonne, and near the royal canal. E. Long. 3. 5. N. Lat. 43. 35.

CAPH, a Jewish measure of capacity for things estimated by Kimchi at the 30th part of the log, by Arbuthnot at the 16th part of the hin or 32d of the seah, amounting to five-eighths of an English pint. The caph does not occur in Scripture as the name of any measure.

CAPHAR, a duty which the Turks raise on the Christians who carry or send merchandises from Aleppo to Jerusalem and other places in Syria.

This duty of caphar was first imposed by the Christians themselves, when they were in possession of the Holy Land, for the maintenance of the troops which were planted in difficult passes to observe the Arabs and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs; with whom, nevertheless, they keep a secret intelligence, favouring their excursions and plunders.

CAPHTOR (anc. geog.), a town or district of Higher Egypt: and hence the people called *Caphtorim* or *Caphtoraci*.—Caphtor is an island of Egypt, Ai Caphtor, (Jeremiah); probably one of those in the Nile. Dr Wells supposes it to be Coptos, which stood in a small island. Thence came the *Caphtorim* or *Caphtoraci*, in Palestine; who with the Philistines conspired to extirpate the Hevaei; and whose name was swallowed up in that of the Philistines.

CAPÍ-AGA, or *CAPÍ-Agassi*, a Turkish officer who is governor of the gates of the seraglio, or grand master of the seraglio.

The capi-aga is the first dignity among the white eunuchs:

Caperquin
||
Capi-aga.

Capias
||
Capilla-
ment.

Capilla-
ments,
Capillary,

eunuchs: he is always near the person of the grand signior: he introduces ambassadors to their audience: nobody enters or goes out of the grand signior's apartment but by his means. His office gives him the privilege of wearing the turban in the seraglio, and of going every where on horseback. He accompanies the grand signior to the apartment of the sultanas, but stops at the door without entering. His appointment is very moderate; the grand signior bears the expence of his table, and allows him at the rate of about sixty French livres per day: but his office brings him in abundance of presents; no affair of consequence coming to the emperor's knowledge without passing through his hand. The capi-aga cannot be bathaw when he quits his post.

CAPIAS, in law, a writ of two sorts; one before judgment in an action, and the other after. That before judgment is called *capias ad respondendum*, where an original is issued out, to take the defendant, and make him answer the plaintiff. That after judgment is of divers kinds; as,

CAPIAS ad Satisfaciendum, a writ of execution that issues on a judgment obtained, and lies where any person recovers in a personal action, as for debt, damages, &c. in which cases this writ issues to the sheriff, commanding him to take the body of him against whom the debt is recovered, who is to be kept in prison till he make satisfaction.

CAPIAS pro Fine is a writ lying where a person is fined to the king, for some offence committed against a statute, and he does not discharge the fine according to the judgment; therefore his body shall be taken by this writ, and committed to gaol till the fine is paid.

CAPIAS Utlegatum, a writ which lies against any one outlawed, upon any action personal or criminal, by which the sheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in safe custody till the day of return, when he is ordered to present him to the court, to be there farther ordered for his contempt.

CAPIAS in Withernam, a writ that lies for cattle in *withernam*: that is, where a distress taken is driven out of the county, so that the sheriff cannot make deliverance upon a replevin; then this writ issues, commanding the sheriff to take as many beasts of the distrainer, &c.

CAPIGI, a porter or door-keeper of the Turkish seraglio. There are about five hundred *capigis* or porters in the seraglio, divided into two companies; one consisting of three hundred, under a chief called *Capigi-Bassa*, who has a stipend of three ducats per day; the other consists of two hundred, distinguished by the name of *Cuccicapigi*, and their chief *Cuccicapigi-Bassa*, who has two ducats. The capigis have from seven to fifteen aspers per day; some more, others less. Their business is to assist the janizaries in the guard of the first and second gates of the seraglio; sometimes all together; as when the Turk holds a general council, receives an ambassador, or goes to the mosque; and sometimes only in part; being ranged on either side to prevent people entering with arms, any tumults being made, &c. The word, in its original, signifies *gate*.

CAPILLAMENT, in a general sense, signifies a hair: whence the word is applied to several things,

which on account of their length or their fineness resemble hairs: as,

CAPILLAMENTS of the Nerves, in anatomy, the fine fibres or filaments whereof the nerves are composed.

CAPILLARY, in a general sense, an appellation given to things on account of their extreme fineness or resembling hair.

CAPILLARY Tubes, in physics, are small pipes of glass, whose canals are extremely narrow, their diameter being only a half, a third, or a fourth of a line.

The ascent of water, &c. in capillary tubes, is a phenomenon that has long embarrassed the philosophers: for let one end of a glass tube open at both extremities be immersed in water, the liquor within the tube will rise to a considerable height above the external surface: or if two or more tubes are immersed in the same fluid, one a capillary tube, and the other of a larger bore, the fluid will ascend higher in the former than in the latter; and this will be in a reciprocal ratio of the diameters of the tubes.

In order to account for this phenomenon, it will be necessary first to premise, that the attraction between the particles of glass and water is greater than the attraction between the particles of waters themselves: for if a glass tube be placed in a position parallel to the horizon, and a drop of water be applied to the under side of the tube, it will adhere to it; nor will it fall from the glass till its bulk and gravity are so far increased, as to overcome the attraction of the glass. Hence it is easy to conceive how sensibly such a power must act on the surface of a fluid, not viscid, as water, contained within the small cavity or bore of a glass-tube; as also that it will be proportionably stronger as the diameter of the bore is smaller; for it will be evident that the efficacy of the power is in the inverse proportion of the diameter, when it is considered, that such particles only as are in contact with the fluid, and those immediately above the surface, can effect it.

Now these particles form a periphery contiguous to the surface, the upper part of which attracts and raises the surface, while the lower part, which is in contact with it, supports it: so that neither the thickness nor length of the tube is of any consequence here; the periphery of particles only, which is always proportionable to the diameter of the bore, is the only acting power. The quantity of the fluid raised will therefore be as the surface of the bore which it fills, that is, as the diameter; for otherwise the effect would not be proportional to the cause, since the quantities are always as the ratio of the diameters; the heights therefore to which the fluids will rise, in different tubes, will be inversely as the diameters.

Some doubt whether the law holds throughout, of the ascent of the fluid being always higher as the tube is smaller; Dr Hook's experiments, with tubes almost as fine as cobwebs, seem to show the contrary. The water in these, he observes, did not rise so high as one would have expected. The highest he ever found it, was at 21 inches above the level of the water in the basin; which is much short of what it ought to have been by the law above mentioned. See COHESION.

CAPILLARY Vessels. Many small vessels of animal bodies have been discovered by the modern invention of injecting the vessels of animals with a coloured fluid which

Capillus
||
Capital.

which upon cooling grows hard. But though most anatomists know the manner of filling the large trunks, few are acquainted with the art of filling the capillaries. Dr Monro, in the Medical Essays, has given what after many trials he has found most successful. See INJECTION.

CAPILLUS VENERIS. See ADIANTHUM.

CAPILUPI, or CAPILUPUS (Camillus), a native of Mantua in the 16th century. He wrote a book, entitled, *The Stratagem*; in which he relates not only what was perpetrated at Paris during the massacre on St Bartholomew's day, but also the artful preparations which preceded that horrid massacre. It is, however, blended with a great number of falsities.

CAPILUPI (Lælius), an Italian poet, brother to the former, made himself famous by some Centos of Virgil. The manner in which he applied Virgil's expressions to represent things which the poet never dreamt of, is admired. His Cento against women is very ingenious, but too satirical. The poems of Capilupi are inserted in the *Delicia Poetarum Italorum*.

CAPISCOLUS, or CAPISCHOLUS, in ecclesiastical writers, denotes a dignitary in certain cathedrals, who had the superintendency of the choir, or band of music, answering to what in other churches is called *chanter* or *precentor*. The word is also written *cabiscolus*, and *caput schola*, q. d. the head of the school, or band of music.

The capiscolus is also called *scolaſticus*, as having the instruction of the young clerks and choristers, how to perform their duty.

CAPITA, (distribution by), in law, signifies the appointing to every man an equal share of a personal estate; when all the claimants claim in their own rights, as in equal degrees of kindred, and not *jure representationis*.

CAPITA, (succession by), where the claimants are next in degree to the ancestor, in their own right, and not by right of representation.

CAPITAL, of the Latin *caput* "the head", is used on various occasions, to express the relation of a head, chief, or principal: thus,

CAPITAL City, in geography, denotes the principal city of a kingdom, state, or province.

CAPITAL Stock, among merchants, bankers, and traders, signifies, the sum of money which individuals bring to make up the common stock of a partnership when it is first formed. It is also said of the stock which a merchant at first puts into trade for his account. It likewise signifies the fund of a trading company or corporation, in which sense the word stock is generally added to it. Thus we say, the capital stock of the bank, &c. The word capital is opposed to that of profit or gain, though the profit often increases the capital, and becomes of itself part of the capital, when joined with the former.

CAPITAL Crime, such a one as subjects the criminal to capital punishment, that is, to loss of life *.

* See Crime and Punishment.

CAPITAL Picture, in painting, denotes one of the finest and most excellent pieces of any celebrated master.

CAPITAL Letters, in printing, large or initial letters, wherein titles, &c. are composed; with which all periods, verses, &c. commence; and wherewith also all proper names of men, kingdoms, nations, &c. begin. The practice which, for some time, obtained among our

N^o 64.

printers, of beginning every substantive with a capital, is now justly fallen into disrepute; being a manifest perversion of the design of capitals, as well as an offence against beauty and distinctness.

CAPITAL, in architecture, the uppermost part of a column or pilaster, serving as the head or crowning, and placed immediately over the shaft, and under the entablature. See ARCHITECTURE.

CAPITANA, or CAPTAIN *Galley*, the chief or principal galley of a state, not dignified with the title of a kingdom. The capitana was anciently the denomination of the chief galley of France, which the commander went on board of. But since the suppression of the office of captain general of the galleys in 1669, they have no capitana, but the first galley is called *reale*, and the second *parone*.

CAPITANATA, one of the 12 provinces of the kingdom of Naples, in Italy, bounded on the north by the Gulph of Venice, on the east by the Terra di Barri, on the south by the Basilicata and the Farther Principato, and on the west by the county di Molise and a small part of Hither Abruzzo. It is a level country, without trees; the soil sandy, the air hot: the land, however, near the rivers, is fertile in pastures. The capital town is Manfredonia.

CAPITANEATE, in a general sense, the same with capitania. Capitaneates, in Prussia, are a kind of noble feuds, or estates, which, besides their revenue, raise their owners to the rank of nobility. They are otherwise called *starosties*.

CAPITANEI, or CATANEI, in Italy, was a denomination given to all the dukes, marquises, and counts, who were called *capitanei regis*. The same appellation was also given to persons of inferior rank who were invested with fees, formerly distinguished by the appellation *valvasores majores*.

CAPITANEUS, in ancient law writers, denotes a tenant in capite, or chief.

CAPITANEUS Ecclesia, the same with advocate.

CAPITANIA, in geography, an appellation given to the 12 governments established by the Portuguese in the Brasils.

CAPITATION, a tax or imposition raised on each person, in proportion to his labour, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it *tributum*, by which taxes on persons are distinguished from taxes on merchandise, which were called *veſtigalia*.

Capitations are never practised among us but in exigencies of state. In France the capitation was introduced by Louis XIV. in 1695; and is a tax very different from the *taille*, being levied from all persons, whether they be subject to the *taille* or not. The clergy pay no capitation, but the princes of the blood are not exempted from it.

CAPITE, in law, (from *caput*, i. e. *rex*; whence *tenere in capite*, is to hold of the king, the head or lord paramount of all the lands in the kingdom): An ancient tenure of land, held immediately of the king, as of his crown, either by knight's service, or by soccage. It is now abolished. See TENURE.

CAPITE *Cens*, in antiquity, the lowest rank of Roman citizens, who in public taxes were rated the least of all, being such as never were worth above 365 asses. They were supposed to have been thus called, because they

Capital
||
Capite.

Capitol,
Capitoline

they were rather counted and marshalled by their heads than by their estates. The *capite censi* made part of the sixth class of citizens, being below the *proletarii*, who formed the other moiety of that class. They were not enrolled in the army, as being judged not able to support the expence of war; for in those days the soldiers maintained themselves. It does not appear, that before Caius Marius any of the Roman generals listed the *capite censi* in their armies.

CAPITOL, CAPITOLIUM, in antiquity, a famous fort or castle, on the Mons Capitolinus at Rome, wherein was a temple dedicated to Jupiter, thence also denominated *Capitolinus*, in which the senate anciently assembled; and which still serves as the city-hall, or town-house, for the meeting of the conservators of the Roman people.—It had its name *capitol*, from *caput*, a man's head, said to have been found fresh, and yet bleeding, upon digging the foundation of the temple built in honour of Jupiter. Arnobius adds, that the man's name was *Tolus*, whence *caput-tolium*.—The first foundations of the capitol were laid by Tarquin the Elder, in the year of Rome 139. His successor Servius raised the walls; and Tarquin the Proud finished it in the year 221. But it was not consecrated till the third year after the expulsion of the kings, and establishment of the consulate. The ceremony of the dedication of the temple was performed by the consul Horatius in 246.

The capitol consisted of three parts; a nave sacred to Jupiter; and two wings, the one consecrated to Juno, the other to Minerva: it was ascended to by stairs; the frontispiece and sides were surrounded with galleries, in which those who were honoured with triumphs entertained the senate at a magnificent banquet, after the sacrifices had been offered to the gods.

Both the inside and outside were enriched with an infinity of ornaments, the most distinguished of which was the statue of Jupiter, with his golden thunderbolt, his sceptre, and crown. In the capitol also were a temple to Jupiter the guardian, and another to Juno, with the mint; and on the descent of the hill was the temple of Concord. This beautiful edifice contained the most sacred deposits of religion, such as the *ancylia*, the books of the Sibyls, &c.

The capitol was burnt under Vitellius, and rebuilt under Vespasian. It was burnt a second time by lightning under Titus, and restored by Domitian.

Anciently the name *capitol* was likewise applied to all the principal temples, in most of the colonies throughout the Roman empire; as at Constantinople, Jerusalem, Carthage, Ravenna, Capua, &c.—That of Tholouse, has given the name of *capitoul*s to its echevins or sheriffs.

CAPITOLINE GAMES, annual games instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the capitol's not being taken by the Gauls. Plutarch tells us, that a part of the ceremony consisted in the public criers putting up the Hetrurians to sale by auction: they also took an old man, and tying a golden bulla about his neck, exposed him to the public derision. Festus says they also dressed him in a *pretexta*.—There was another kind of Capitoline games, instituted by Domitian, wherein there were rewards and crowns bestowed on the poets, champions, orators, historians, and musicians. These last Capitoline games

VOL. IV. Part. I.

were celebrated every five years, and became so famous, that, instead of calculating time by lustra, they began to count by Capitoline games, as the Greeks did by Olympiads. It appears, however, that this custom was not of long continuance.

CAPITOLINUS (Julius), an historian in the beginning of the fourth age under Dioclesian, to whom he inscribed the Lives of Verus, Antoninus Pius, Clodius Balbinus, Macrinus, the Maximins, and the Gordians. He wrote other lives, which are most of them lost.

CAPITOUL, or CAPITOL, an appellation given to the chief magistrates of Tholouse, who have the administration of justice and policy both civil and mercantile in the city. The capitouls at Tholouse are much the same with the echevins at Paris, and with the consuls, bailiffs, burger-masters, mayors, and aldermen, &c. in other cities. In ancient acts they are called *consules capitularii* or *capitolini*, and their body *capitulum*. From this last come the words *capitularii* and *capitouls*. The appellation *capitolini* arose hence, that they have the charge and custody of the town-house, which was anciently called *capitol*.

The office only lasts one year, and ennobles the bearers. In some ancient acts they are called *capitulum nobilium Tolosa*. Those who have borne it, style themselves afterwards burgeses. They are called to all general councils, and have the *jus imaginum*; that is, when the year of their administration is expired, their pictures are drawn in the town-house; a custom which they have retained from the ancient Romans, as may be seen in Sigonius.

CAPITOULATE, an appellation given to the several quarters or districts of the city of Tholouse, each under the direction of a capitoul; much like the wards of London, under their aldermen. Tholouse is now divided into eight *capitoulates* or quarters, which are subdivided into *moulans*, each of which has its tithing-man, whose business is to inform the capitoul of what passes in his tithing, and to inform the inhabitants of the tithing of the orders of the capitoul.

CAPITULAR, or CAPITULARY, denotes an act passed in a chapter, either of knights, canons, or religious.

The capitularia, or capitulars of Charlemagne, Charles the Bald, &c. are the laws, both ecclesiastical and civil, made by those emperors in the general councils or assemblies of the people; which was the way in which the constitutions of most of the ancient princes were made; each person present, though a plebeian, setting his hand to them.

Some distinguish these from laws; and say, they were only supplements to laws. They had their name, capitulars, because divided into capitula, chapters, or sections. In these capitulars did the whole French jurisprudence anciently consist. In process of time, the name was changed for that of ordonnances.

Some distinguish three kinds of capitulars, according to the difference of their subject-matter: those on ecclesiastical affairs, are really canons, extracted from councils; those on secular affairs, real laws; those relating to particular persons, or occasions, private regulations.

CAPITULATION, in military affairs, a treaty made between the inhabitants or garrison of a place

S

besieged

Capitolinus
||
Capitulation.

Capitulation
||
Capo.

besieged and the besiegers, for the delivering up the place on certain conditions. The most honourable and ordinary terms of capitulation are, To march out at the breach with arms and baggage, drums beating, colours flying, a match lighted at both ends, and some pieces of cannon, waggons and convoys for their baggage, and for their sick and wounded.

CAPITULATION, in the German polity, a contract which the emperor makes with the electors, in the name of all the princes and states in the empire, before he is declared emperor, and which he ratifies before he is raised to that sovereign dignity. The principal points which the emperor undertakes to observe are, 1. To defend the church and empire. 2. To observe the fundamental laws of the empire. And, 3. To maintain and preserve the rights, privileges, and immunities of the electors, princes, and other states of the empire, specified in the capitulation. These articles and capitulations are presented to the emperor by the electors only, without the concurrence of the other states, who have complained from time to time of such proceedings; and in the time of the Westphalian treaty, in 1648, it was proposed to deliberate in the following diet, upon a way of making a perpetual capitulation; but the electors have always found means of eluding the execution of this article. In order, however, to give some satisfaction to their adversaries, they have inserted in the capitulations of the emperors, and in that of Francis I. in particular, a promise to use all their influence to bring the affair of a perpetual capitulation to a conclusion. Some German authors own, that this capitulation limits the emperor's power; but maintain that it does not weaken his sovereignty: though the most part maintain that he is not absolute, because he receives the empire under conditions, which sets bounds to an absolute authority.

CAPITULUM, in the ancient military art, was a transverse beam, wherein were holes through which passed the strings whereby the arms of huge engines, as balistæ, catapultæ, and scorpions, were played or worked.

CAPITULUM, in ecclesiastical writers, denoted part of a chapter of the bible read and explained. In which sense they said, *ire ad capitulum*, to go to such a lecture. Afterwards the place or apartment where such theological exercises were performed was denominated *domus capituli*.

CAPNICON, in antiquity, chimney-money, or a tax which the Roman emperors levied for smoke, and which of consequence was due from all, even the poorest, who kept a fire. This was first invented by Nicephorus.

CAPNOMANCY, a kind of divination by means of smoke, used by the ancients in their sacrifices. The word comes *καπνος*, smoke, and *μαντια*, divination. The general rule was, when the smoke was thin, and light, and rose straight up, it was a good omen: if the contrary, it was an ill one. There was also another species of capnomancy, consisting in the observation of the smoke rising from poppy and jessamin-seed, cast upon lighted coals.

CAPO FINO, a large barren rock in the territory of the Genoese, which has a castle on its eastern peak. Near it is a small harbour of the same name, 13 miles east by south of Genoa.

CAPO d'Istria, a considerable town of Italy, in Istria, on the gulph of Trieste, with a bishop's see, and subject to the Venetians. The air is wholesome and temperate; its principal revenue consists in wine and salt. E. Long. 14. 0. N. Lat. 45. 48.

CAPON, a cock-chicken, gelded as soon as left by the dam, or as soon as he begins to crow. They are of use either to lead chickens, ducklings, pheasants, &c. and defend them from the kites and buzzards; or to feed for the table, they being reckoned more delicate than either a cock or a hen.

CAPONIERE, or CAPPONIERE, in fortification, a covered lodgement, sunk four or five feet into the ground, encompassed with a little parapet about two feet high, serving to support several planks covered with earth. The caponiere is large enough to contain 15 or 20 soldiers; and is usually placed in the glacis on the extremity of the counterscarp, and in dry moats; having little embrasures for the soldiers to fire through.

CAPPADOCIA, an ancient kingdom of Asia, comprehending all that country which lies between mount Taurus and the Euxine sea. It was divided by the Persians into two satrapies or governments; by the Macedonians into two kingdoms, the one called *Cappadocia ad Taurum*; the other, *Cappadocia ad Pontum*, and commonly *Pontus*; for the history, &c. of which last, see the article *PONTUS*.

CAPPADOCIA Magna, or Cappadocia properly so called, lies between the 38th and 41st degrees of north latitude. It was bounded by Pontus on the north, Lycaonia and part of Armenia Major on the south, Galatia on the west, and by Euphrates and part of Armenia Minor on the east. The first king of Cappadocia we read of in history was Pharnaces, who was preferred to the crown by Cyrus king of Persia, who gave him his sister Atossa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we know scarce any thing but that they continued faithful to the Persian interest. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithstanding the vast conquests and fame of the Macedonian monarch, continued unshaken in his fidelity to the Persians. Alexander was prevented by death from invading his dominions; but Perdiccas marching against him with a powerful and well disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him, with all those of the royal blood whom he could get into his power. Diodorus tells us that he was killed in the battle. He is said to have reigned 82 years. His son Ariarathes III. having escaped the general slaughter of the royal family, fled into Armenia, where he lay concealed, till the civil dissensions which arose among the Macedonians gave him a fair opportunity of recovering his paternal kingdom. Amyntas, at that time the governor of Cappadocia, opposed him: but being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong holds. Ariarathes, after a long and peaceable reign, left his kingdom to his son Ariaramnes II. He applied himself more to the arts of peace than war, in consequence of which Cappadocia flourished greatly during his reign. He was succeeded by his son Ariarathes IV. who.

Capo
||
Cappadocia.

Cappado-
cia.

who proved a very warlike prince, and having overcome Arfaces, founder of the Parthian monarchy, considerably enlarged his own dominions.

He was succeeded by Ariarathes V. who marrying the daughter of Antiochus the Great, entered into an alliance with that prince against the Romans; but Antiochus being defeated, the king of Cappadocia was obliged to sue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms against the people of Rome. He afterwards assisted the republic with men and money against Perseus king of Macedon, on which account he was by the senate honoured with the title of the *friend and ally of the Roman people*. He left the kingdom in a very flourishing condition to his son Mithridates, who on his accession took the name of Ariarathes VI.

This prince (surnamed *Philopater*, from the filial respect and love he showed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere good-nature he restored Mithrobuzanes son to Ladriades king of the Lesser Armenia to his father's kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia. These differences, however, were settled before they came to an open rupture, by the Roman legates; and Ariarathes seeing himself thus delivered from an impending war by the mediation of the republic, presented the senate with a golden crown, and offered his service wherever they thought proper to employ him. The senate in return sent him a staff, and chair of ivory; which were presents usually bestowed on those only whom they looked upon as attached to their interest. Not long before this, Demetrius Soter king of Syria had offered Ariarathes his sister in marriage, the widow of Perseus king of Macedon: but this offer the king of Cappadocia was obliged to decline for fear of offending the Romans; and his so doing was in the highest degree acceptable to the republic, who reckoned him among the chief of her allies. Demetrius, however, being greatly incensed at the slight put upon his sister, set up a pretender to the throne, one Orophernes, a supposititious, or, as others call him, a natural son of the deceased king. The Romans ordered Eumenes king of Pergamus to assist Ariarathes with all his forces: which he did, but to no purpose; for the confederates were overthrown by Demetrius, and Ariarathes was obliged to abandon the kingdom to his rival. This happened about 159 years before Christ, and the usurper immediately dispatched ambassadors to Rome with a golden crown. The senate declined accepting the present, till they heard his pretensions to the kingdom; and this Orophernes, by suborned witnesses, made appear so plain, that the senate decreed that Ariarathes and he should reign as partners; but next year, Orophernes was driven out by Attalus brother to Eumenes, and his successor to the kingdom of Pergamus.

Ariarathes, being thus restored, immediately demanded of the Priennians 400 talents of gold which Orophernes had deposited with them. They honestly replied, that as they had been trusted with the money by Orophernes, they could deliver it to none but himself, or such as came in his name. Upon this, the king entered their territories with an army, destroying all with fire and sword. The Priennians, however, still

persevered in their integrity; and though their city was besieged by the united forces of Ariarathes and Attalus, not only made an obstinate defence, but found means to restore the sum to Orophernes. At last they applied to the Romans for assistance, who enjoined the two kings to raise the siege, under pain of being declared enemies to the republic. Ariarathes immediately obeyed; and marching his army into Assyria, joined Alexander Epiphanes against Demetrius Soter, by whom he had been formerly driven out of his kingdom. In the very first engagement Demetrius was slain, and his army entirely dispersed, Ariarathes having on that occasion given uncommon proofs of his courage and conduct. Some years after, a war breaking out between the Romans and Aristonicus who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was slain in the same battle in which P. Crassus proconsul of Asia was taken, and the Roman army cut in pieces. He left six sons by his wife Laodice, on whom the Romans bestowed Lycæonia and Cilicia. But Laodice, fearing lest her children, when they came of age, should take the government out of her hands, poisoned five of them, the youngest only having escaped her cruelty by being conveyed out of the kingdom. The queen herself was soon after put to death by her subjects, who could not bear her cruel and tyrannical government.

Laodice was succeeded by Ariarathes VII. who, soon after his accession, married another Laodice, daughter of Mithridates the Great, hoping to find in that prince a powerful friend to support him against Nicomedes king of Bithynia, who laid claim to part of Cappadocia. But Mithridates instead of assisting, procured one Gordius to poison his unhappy son-in-law; and, on his death, seized the kingdom, under pretence of maintaining the rights of the Cappadocians against Nicomedes, till the children of Ariarathes were in a condition to govern the kingdom. The Cappadocians at first fancied themselves obliged to their new protector; but, finding him unwilling to resign the kingdom to the lawful heir, they rose up in arms, and, driving out all the garrisons placed by Mithridates, placed on the throne Ariarathes VIII. eldest son of their deceased king.

The new prince found himself immediately engaged in a war with Nicomedes; but, being assisted by Mithridates, not only drove him out of Cappadocia, but stripped him of a great part of his hereditary dominions. On the conclusion of the peace, Mithridates, seeking for some pretence to quarrel with Ariarathes, insisted upon his recalling Gordius, who had murdered his father; which being rejected with abhorrence, a war ensued. Mithridates took the field first, in hopes of over-running Cappadocia before Ariarathes could be in a condition to make head against him; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and, in sight of both armies, stabbed him with a dagger, which he had concealed under his garment. This struck such terror into the Cappadocians, that they immediately dispersed, and gave Mithridates an opportunity of possessing himself of the kingdom without the least opposition. The Cappadocians, however, not able to endure the tyranny of his prefects, soon

Cappado-
cia.

Cappado-
cia.

shook off the yoke; and recalling the king's brother, who had fled into the province of Asia, proclaimed him king. He was scarce seated on the throne, however, before Mithridates invaded the kingdom at the head of a very numerous army, and having drawn Ariarathes to a battle, defeated his army with great slaughter, and obliged him to abandon the kingdom. The unhappy prince soon after died of grief; and Mithridates bestowed the kingdom on his son, who was then but eight years old, giving him also the name of *Ariarathes*. But Nicomedes Philopater king of Bithynia, fearing lest Mithridates, having now got possession of the whole kingdom of Cappadocia, should invade his territories, suborned a youth to pass himself for the third son of Ariarathes, and to present to them a petition in order to be restored to his father's kingdom. With him he sent to Rome Laodice, sister of Mithridates, whom he had married after the death of her former husband Ariarathes. Laodice declared before the senate, that she had three sons by Ariarathes, and that the petitioner was one of them; but that she had been obliged to keep him concealed, lest he should undergo the same fate with his brothers. The senate assured him that they would at all events reinstate him in his kingdom. But, in the mean time, Mithridates having notice of these transactions, dispatched Gordius to Rome, to undeceive the senate, and to persuade them that the youth to whom he had resigned the kingdom of Cappadocia was the lawful son of the late king, and grandson to Ariarathes who had lost his life in the service of the Romans against Aristonicus. This unexpected embassy put the senate upon enquiring more narrowly into the matter, whereby the whole plot was discovered; upon which Mithridates was ordered to resign Cappadocia, and the kingdom was declared free. The Cappadocians, however, in a short time sent ambassadors to Rome, acquainting the senate that they could not live without a king. This greatly surprised the Romans, who had such an aversion to royal authority; but they gave them leave to elect a king of their own nation. As the family of Pharnaces was now extinct, the Cappadocians chose Ariobarzanes; and their choice was approved by the senate, he having on all occasions shown himself a steady friend to the Romans.

Ariobarzanes had scarce taken possession of his kingdom when he was driven out by Tigranes king of Armenia; who resigned Cappadocia to the son of Mithridates, in pursuance of an alliance previously concluded between the two parties. Ariobarzanes fled to Rome; and, having engaged the senate in his cause, he returned into Asia with Sylla, who was enjoined to restore him to his kingdom. This was easily performed by Sylla, who, with a small body of troops, routed Gordius who came to meet him on the borders of Cappadocia at the head of a numerous army. Sylla, however, had scarce turned his back, when Ariobarzanes was again driven out by Ariarathes the son of Mithridates, on whom Tigranes had bestowed the kingdom of Cappadocia. This obliged Sylla to return into Asia, where he was attended with his usual success, and Ariobarzanes was again placed on the throne. After the death of Sylla, he was the third time forced by Mithridates to abandon his kingdom; but Pompey, having entirely defeated Mithridates near mount Stel-

Cappado-
cia.

la, restored Ariobarzanes to his throne, and rewarded him for his services during the war, with the provinces of Sophene, Gordiene, and great part of Cilicia. The king, however, being now advanced in years, and desirous of spending the remainder of his life in ease, resigned the crown to his son Ariobarzanes, in presence of Pompey; and never afterwards troubled himself with affairs of state.

Ariobarzanes II. proved no less faithful to the Romans than his father had been. On the breaking out of the civil war between Cæsar and Pompey, he sided with the latter; but after the death of Pompey, he was received into favour by Cæsar, who even bestowed upon him great part of Armenia. While Cæsar was engaged in a war with the Egyptians, Pharnaces king of Pontus invaded Cappadocia, and stripped Ariobarzanes of all his dominions; but Cæsar, having defeated Pharnaces, restored the king of Cappadocia, and honoured him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, having refused to join Brutus and Cassius, was by them declared an enemy to the republic, and soon after taken prisoner and put to death. He was succeeded by his brother Ariobarzanes III. who was by Marc Anthony deprived both of his kingdom and life; and in him ended the family of Ariobarzanes.

Archelaus, the grandson of that general of the same name who commanded against Sylla in the Mithridatic war, was by Marc Anthony placed on the throne of Cappadocia, though nowise related either to the family of Pharnaces or Ariobarzanes. His preferment was entirely owing to his mother Glaphyra, a woman of great beauty, but of a loose behaviour, who, in return for her compliance with the desires of Anthony, obtained the kingdom of Cappadocia for her son. In the war between Augustus and Anthony, he joined the latter; but at the intercession of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Lesser, and Cilicia Trachæa, for having assisted the Romans in clearing the seas of pirates who greatly infested the coasts of Asia. He contracted a strict friendship with Herod the Great, king of Judæa; and even married his daughter Glaphyra to Alexander, Herod's son. In the reign of Tiberius, Archelaus was summoned to appear before the senate; for he had always been hated by that emperor, because in his retirement at Rhodes he had paid him no sort of respect. This had proceeded from no aversion in him to Tiberius, but from the warning given Archelaus to his friends at Rome. For Caius Cæsar, the presumptive heir to the empire, was then alive, and had been sent to compose the differences of the east, whence the friendship of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the disrespect shown him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promised him her son Tiberius's pardon, provided he came in person to implore it. Archelaus obeyed the summons, and hastened to Rome; where he was received by the emperor with great wrath and contempt, and soon after accused as a criminal in the senate. The crimes of which he was accused were mere fictions; but his concern at seeing himself treated as a malefactor was so great, that he died soon after of grief, or, as others say, laid violent.

Cappadocia. lent hands on himself. He is said to have reigned 50 years.

On the death of Archelaus, the kingdom of Cappadocia was reduced to a Roman province, and governed by those of the equestrian order. It continued subject to the Romans till the invasion of the eastern empire by the Turks, to whom it is now subject, but has no distinguishing modern name. In what was anciently called *Cappadocia*, however, the Turks have four Beglerbeglics, called *Sivas*, *Trebizond*, *Marasch*, and *Cogni*.

In the time of the Romans, the inhabitants of Cappadocia bore so bad a character, and were reputed so vicious and lewd, that, among the neighbouring nations, a wicked man was emphatically called a *Cappadocian*. In after ages, however, their lewd disposition was so corrected and restrained by the pure doctrines of Christianity, that no country whatever has produced greater champions of the Christian religion, or given to the church prelates of more unblemished characters.

We have now no system of the Cappadocian laws, and scarce wherewithal to form any particular idea of them. As to their commerce, they carried on a considerable trade in horses, great numbers of which were produced in their country; and we read of them in Scripture as frequenting the fairs of Tyre with this commodity. As Cappadocia abounded with mines of silver, brass, iron, and alum, and afforded great store of alabaster, crystal, and jasper, it is probable that they might supply the neighbouring countries with these commodities.

The religion of the ancient Cappadocians was much the same with that of the Persians. At Comana there was a rich and stately temple dedicated to Bellona; whose battles the priests and their attendants used to represent on stated days, cutting and wounding each other as if seized with an enthusiastic fury. No less famous and magnificent were the temples of Apollo Catanius, and of Jupiter: the last of which had 3000 sacred servants, or religious votaries. The chief priest was next in rank to that of Comana; and, according to Strabo, had an yearly revenue of 15 talents. Diana Persica was worshipped in a city called *Castaballa*, where women, devoted to the worship of that goddess, were reported to tread barefooted on burning coals, without receiving any hurt. The temples of Diana at Diospolis, and of Anias at Zela, were likewise held in great veneration both by the Cappadocians and Armenians, who flocked to them from all parts. In the latter were tendered all oaths in matters of consequence; and the chief among the priests was no way inferior in dignity, power, and wealth, to any in the kingdom; having a royal attendance, and an unlimited authority over all the inferior servants and officers of the temple. The Romans, who willingly adopted all the superstitions and superstitious rites of the nations they conquered, greatly increased the revenues of this and other temples; conferring the priesthood on such as they thought most fit for carrying on their designs.—We are told that human sacrifices were offered at Comana; and that this barbarous custom was brought by Orestes and his sister Iphigenia from Taurica Scythica, where men and women were immolated to Diana. But

this custom, if ever it obtained in Cappadocia, was abolished in the times of the Romans.

CAPPANUS, a name given by some authors to a worm that adheres to and gnaws the bottoms of ships; to which it is extremely pernicious, especially in the East and West Indies: to prevent this, several ships have lately been sheathed with copper; the first trial of which was made on his majesty's frigate the Alarm.

CAPPARIS, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 25th order, *Putamineæ*. The calyx is tetraphyllous and coriaceous; there petals are four; the stamina are long; the fruit is a berry, carnosus, unilocular, and pedunculated, or furnished with a foot-stalk.

There are seven species. The spinosa, or common caper, is a low shrub, generally growing out of the joints of old walls, the fissures of rocks, and amongst rubbish, in most of the warm parts of Europe: it hath woody stalks, which send out many lateral slender branches; under each of these are placed two short crooked spines, between which and the branches come out the footstalks of the leaves, which are single, short, and sustain a round smooth entire leaf. At the intermediate joints, between the branches, come out the flowers on long footstalks; before these expand, the bud with the empalement is gathered for pickling. Those which are last expand in form of a single rose, having five large white petals, which are roundish and concave; in the middle are placed a great number of long stamina, surrounding a style which rises above them, and crowned with an oval germen, which afterwards becomes a capsule filled with kidney-shaped seeds.

Culture. This plant is very difficultly preserved in Britain: it delights to grow in crevices of rocks, old walls, &c. and always thrives best in an horizontal posture; so that, when planted either in pots or in the full ground, they seldom thrive, though they may be kept alive for some years. They are propagated by seeds in the warm parts of Europe, but very seldom in Britain.

Uses. The buds, pickled with vinegar, &c. are brought to Britain annually from Italy and the Mediterranean. They are supposed to excite appetite and assist digestion; and to be particularly useful as detergents and aperients in obstructions of the liver and spleen.

CAPRA, or GOAT, a genus of quadrupeds belonging to the order of pecora. The horns are hollow, turned upwards, erect, and scabrous. There are eight fore-teeth in the under jaw, and none in the upper; and they have no dog-teeth. This genus consists of 14 species, viz.

1. The HIRCUS, or common goat, with arched carinated horns, and a long beard. It is a native of the eastern mountains.

The goat is an animal of more sagacity than the sheep. Instead of having an antipathy at mankind, they voluntarily mingle with them, and are easily tamed. Even in uninhabited countries, they betray no savage dispositions. In the year 1698, an English vessel having put in to the island of Bonavilla, two negroes came aboard, and offered gratis to the captain as many

Capra. many goats as he pleased. The captain expressed his astonishment at this offer. But the negroes replied, that there were only 12 persons in the island; that the goats had multiplied to such a degree, that they were become extremely troublesome; and that, instead of having any difficulty in catching them, they followed the men wherever they went, and were so obstinately officious, that they could not get quit of them upon any account whatever.

Goats are sensible of caresses, and capable of a considerable degree of friendship. They are stronger, more agile, and less timid, than sheep. They have a lively, capricious, and wandering disposition; are fond of high and solitary places, and frequently sleep upon the very points of rocks. They are more easily supported than any other animal of the same size; for there is hardly an herb, or the bark of a tree, which they will not eat with pleasure. Neither are they liable to so many diseases as sheep: they can bear heat and cold with less inconvenience. The actions and movements of animals depend more upon the force and variety of their sensations than the structure of their bodies: the natural inconstancy or fancifulness of goats is accordingly expressed by the irregularity of their actions: they walk, stop short, run, jump, show and hide themselves, as it were by mere caprice, and without any other cause than what arises from the natural vivacity of their temper.

The buck will copulate when he is a year old, and the female when she is seven months. But as this is rather premature, they are generally restrained till they be 18 months or two years. The buck is bald, beautiful, and vigorous; one is sufficient to serve 150 females. A buck for propagation should be large, handsome, and about two years of age; his neck should be short and fleshy; his head slender; his ears pendent; his thighs thick; his limbs firm; his hair black, thick, and soft; and his beard should be long and bushy. The females are generally in season from September to the end of November. At that time the males drive whole flocks of the females continually from place to place, and fill the whole atmosphere around them with their strong disagreeable odour; which, though as disagreeable as asafœtida itself, yet may be conducive to prevent many distempers, and to cure nervous and hysterical ones. Horses are supposed to be much refreshed by it; on which account many people keep a he-goat in their stables or stalls.

Goats go with young four months and an half, and bring forth from the latter end of February to the latter end of April: having only two teats, they generally bring forth but one or two young; sometimes three; and in good warm pastures there have been instances, tho' rare, of their bringing forth four at a time. They continue fruitful till they are seven years of age; but a buck goat is seldom kept after he is five. Both young and old are affected by the weather; a rainy season makes them thin, a dry sunny one makes them fat and blithe: their excessive venery prevents their longevity; for in our climate they seldom live above 11 or 12 years.

Though the food of this animal costs next to nothing, as it can support itself even upon the most barren mountains, their produce is valuable. The whitest wigs are made of their hair; for which purpose

that of the he-goat is most in request: the whitest and clearest is selected from that which grows on the haunches, where it is longest and thickest: a good skin well haired is sold for a guinea; though a skin of bad hue, and so yellow as to baffle the barber's skill to bleach, will not fetch above 18d. or 2s. The Welsh goats are far superior in size, and in length and fineness of hair, to those of other mountainous countries. Their usual colour is white: those of France and the Alps are short-haired, reddish, and the horns small. Bolsters made from the hair of a goat were in use in the days of Saul, as appears from 1 Samuel xix. 13. The species very probably was the Angora goat, which is only found in the East; and whose soft and silky hair supplied a most luxurious couch.

The suet of the goat is in great esteem as well as the hair. Many of the inhabitants of Caernarvonshire suffer these animals to run wild on the rocks in winter as well as in summer; and kill them in October for the sake of their fat, either by shooting them with bullets, or by running them down with dogs like deer. The goats killed for this purpose are about four or five years old. Their suet will make candles far superior in whiteness and goodness to those made from that of the sheep or the ox, and accordingly brings a much greater price in the market; nor are the horns without their use, the country people making of them excellent handles for tucks and pen-knives. The skin is peculiarly well adapted for the glove manufactory, especially that of the kid: abroad it is dressed and made into stockings, bed-ticks, bed-hangings, sheets, and even shirts. In the army it covers the horseman's arms, and carries the foot-soldier's provisions. As it takes a dye better than any other skin, it was formerly much used for hangings in the houses of people of fortune, being susceptible of the richest colours, and when flowered and ornamented with gold and silver became an elegant and superb furniture.

The flesh is of great use to the inhabitants of those countries which abound with goats; and affords them a cheap and plentiful provision in the winter-months, when the kids are brought to market. The haunches of the goat are frequently salted and dried, and supply all the uses of bacon: this by the Welsh is called *coch yr wden*, or hung venison. The meat of a splayed goat of six or seven years old (which is called *hyfi*) is reckoned the best; being generally very fat and sweet. This makes an excellent patty; goes under the name of *rock venison*; and is little inferior to that of the deer.

The milk of the goat is sweet, nourishing, and medicinal. It is an excellent succedaneum for ass's milk; and has (with a tea-spoonful of hartshorn drunk warm in bed in the morning, and at four in the afternoon, and repeated for some time) been a cure for phthical people before they were gone too far. In some of the mountainous parts of Scotland and Ireland, the milk is made into whey, which has done wonders in this and other cases where coolers and restoratives are necessary; and to many of those places there is as great a resort of patients of all ranks, as there is in England to the Spas or baths. It is not surprising that the milk of this animal is so salutary, as it browses only on the tops, tendrils, and flowers, of the mountain shrubs, and medicinal herbs; rejecting the grosser parts. The blood

of

Capra.

of the he-goat, dried, was formerly reckoned a specific in pleurifies, and is even taken notice of by Dr Mead for this purpose; but is now deservedly neglected. Cheese made of goat's milk is much valued in some of our mountainous countries, when kept to a proper age; but has a peculiar taste and flavour.

a. The Angora goat is a variety that is found only in the tract that surrounds Angora and Beibazar, towns in Asiatic Turkey, for the distance of three or four days journey. Strabo seems to have been acquainted with this kind; for speaking of the river Halys, he says, that there are goats found near it that are not known in other parts. In the form of their body they differ from the common goat, being shorter; their legs too are shorter, their sides broader and flatter, and their horns straighter; but the most valuable characteristic is their hair, which is soft as silk, of a glossy silvery whiteness, and curled in locks of eight or nine inches in length. This hair is the basis of our fine camlets, and imported to England in form of thread; for the Turks will not permit it to be exported raw, for a reason that does them honour; because it supports a multitude of poor, who live by spinning it. The goat-herds of Angora and Beibazar are extremely careful of their flocks, frequently combing and washing them. It is observed, that if they change their climate and pasture, they lose their beauty: we therefore suspect that the design of Baron Alstroemer, a patriotic Swede, turned out fruitless, who imported some into his own country, to propagate the breed for the sake of their hair.

b. The *Capricorn* of Buffon is another variety, having short horns, the ends turned forwards, their sides annulated, and the rings more prominent before than behind.

II. The *IBEX*, or wild-goat, is the stock from whence the tame species sprung. It has large knotty horns reclined upon its back, is of a yellowish colour, and its beard is black. The females are less, and have smaller horns, more like those of a common she-goat, and with few knobs on the upper surface: they bring one young one, seldom two, at a birth. They inhabit the highest Alps of the Grison's country and the Valais; are also found in Crete. They are very wild, and difficult to be shot, as they always keep on the highest points. Their chase is exceedingly dangerous: being very strong, they often tumble the incautious huntsman down the precipices, except he has time to lie down, and let the animals pass over him. They are said not to be long-lived.

III. The *MAMBRIN*, or Syrian goat, with reclined horns, pendant ears, and a beard. It is a native of the East. Their ears are of a vast length; from one to two feet; and sometimes so troublesome, that the owners cut off one to enable the animal to feed with more ease. These animals supply Aleppo with milk.

IV. The *RUPICAPRA*, or chamois-goat, has erect and hooked horns. The body is of a dusky red colour; but the front, top of the head, gullet, and inside of the ears, are white; the under part of the tail is blackish; and the upper lip is a little divided. It inhabits the Alps of Dauphine, Switzerland, and Italy; the Pyrenean mountains; Greece, and Crete: does not dwell so high in the hills as the ibex, and is found in greater numbers.

Capra.

The chamois is of the size of a domestic goat, and his hair is as short as that of a hind. His vivacity is delightful, and his agility truly admirable. These animals are very social among themselves: We find them going in pairs, or in little flocks of from three to twenty; and sometimes we see from 60 to 100 of them dispersed in different flocks along the declivity of the same mountain. The large males keep at a distance from the rest, except in the rutting season, when they join the females, and beat off all the young. At this period, their ardour is still stronger than that of the wild bucks. They bleat often, and run from one mountain to another. Their season of love is in the months of October and November, and they bring forth in March and April. A young female takes the male at the age of 18 months. The females bring forth one, but rarely two, at a time. The young follow their mothers till October, if not dispersed by the hunters or the wolves. We are assured that they live between 20 and 30 years. Their flesh is very good. A fat chamois goat will yield from 10 to 12 pounds of suet, which is harder and better than that of the goat. The blood of the chamois is extremely hot, and it is said to have qualities and virtues nearly equal to those of the wild goat. The hunters sometimes mix the blood of the wild and chamois goats: At other times they sell the blood of the wild goat for that of the chamois. The voice of the chamois is a very low and almost imperceptible kind of bleating, resembling that of a hoarse domestic goat. It is by this bleating that they collect together, particularly the mothers and their young. But, when alarmed, or when they perceive their enemy, or any thing the nature of which they cannot distinguish, they advertise one another by a kind of whistling noise. The sight of the chamois is very penetrating, and his sense of smelling is acute. When he sees a man distinctly, he stops for some time, and flies off when he makes a nearer approach. His sense of hearing is equally acute as that of smelling; for he hears the smallest noise. When the wind blows in the direction between him and a man, he will perceive the scent at the distance of more than half a league. Hence, when he smells or hears any thing which he cannot see, he whistles or blows with such force, that the rocks and forests re-echoe the sound. If there are many of them near, they all take the alarm. This whistling is as long as the animal can blow without taking breath. It is at first sharp, and turns flat at the end. The chamois then stops for a moment, looks round on all sides, and begins whistling afresh, which he continues from time to time. His agitation is extreme. He strikes the earth with his feet; he leaps upon the highest stones he can find; he again looks round, leaps from one eminence to another; and, when he discovers any thing, he flies off. The whistling of the male is sharper than that of the female. This whistling is performed through the nostrils, and consists of a strong blowing, similar to the sound which a man may make by fixing his tongue to the palate, with his teeth nearly shut, his lips open, and somewhat extended, and blowing long and with great force. The chamois feeds on the finest herbs. He selects the most delicate parts of plants, as the flowers and the tenderest buds. He is very fond of some aromatic herbs, particularly of the carline thistle and genipay, which are

Capra.

are the hottest plants that grow in the Alps. When he eats green herbs, he drinks very little. He is very fond of the leaves and tender buds of shrubs. He ruminates like the common goat. The food he uses seems to announce the heat of his constitution. This animal is admired for his large round eyes, whose size corresponds with the vivacity of his disposition. His head is adorned with two small horns, from half a foot to nine inches in length. Their colour is a fine black, and they are placed on the front nearly between his eyes; and, instead of being reflected backward, like those of other animals, they advance forward above the eyes, and bend backward at the points, which are extremely sharp. He adjusts his ears most beautifully to the points of his horns. Two tufts of black hair descend from his horns to the sides of his face. The rest of the head is of a yellowish white colour, which never changes. The horns of the chamois are used for the heads of canes. Those of the female are smaller and less crooked. The skin of the chamois, when dressed, is very strong, nervous, and supple, and makes excellent riding-breeches, gloves, and vests. Garments of this kind last long, and are of great use to manufacturers. The chamois goats are so impatient of heat, that, in summer, they are only to be found under the shades of caverns in the rocks, among masses of congealed snow and ice, or in elevated forests on the northern declivities of the most scabrous mountains, where the rays of the sun seldom penetrate. They pasture in the mornings and evenings, and seldom during the day. They traverse the rocks and precipices with great facility, where the dogs dare not follow them. There is nothing more worthy of admiration than to see these animals climbing or descending inaccessible rocks. They neither mount nor descend perpendicularly, but in an oblique line. When descending, particularly, they throw themselves down across a rock which is nearly perpendicular, and of 20 or 30 feet in height, without having a single prop to support their feet. In descending, they strike their feet three or four times against the rock, till they arrive at a proper resting-place below. The spring of their tendons is so great, that, when leaping about among the precipices, one would imagine they had wings instead of limbs. It has been alleged by some, but without foundation, that the chamois, in climbing and descending rocks, supports himself by his horns. It is by the strength and agility of his limbs that the chamois is enabled to climb and descend rocks. His legs are very free and tall; those behind are somewhat longer, and always crooked, which favours their springing to a great distance; and, when they throw themselves from a height, the hind legs receive the shock, and perform the office of two springs in breaking the fall. In great snows, and during the rigour of winter, the chamois goats inhabit the lower forests, and live upon pine leaves, the buds of trees, bushes, and such green or dry herbs as they can find by scratching off the snow with their feet. The forests that delight them most, are those which are very full of rocks and precipices. The hunting of the chamois is very difficult and laborious. The mode most in use is to kill them by surprise. The hunters conceal themselves behind rocks or large stones, taking care that the wind

blows opposite to them, and, when a favourable opportunity occurs, shoot them with musket-balls. They are likewise hunted in the same manner as stags and other animals, by posting some of the hunters in narrow passages, while others beat about to raise the game. Men are preferable for this purpose to dogs; for dogs too quickly disperse the animals, who fly off suddenly to the distance of four or five leagues.

V. The *DEPRESSA* is an African goat, with small depressed horns, bent inwards, lying on the head. It is about the size of a kid; and the hair is long and pendulous.

VI. The *REVERSA* is likewise an African goat, with erect horns, and curved a little forwards. It is about the size of a kid of a year old. It inhabits Juda or Whidaw in Africa.

VII. The *GAZELLA* has long, erect, cylindrical horns, annulated near the base. It inhabits Egypt, the Cape, Arabia, the Levant, and India, dwelling in the plains.

VIII. The *CERVICAPRA*, with plated cylindrical horns, inhabits Barbary. The hair near the horns is longer than in any other part of the body. The females want horns. Mr Hasselquist gives the following account of this species: "The cervicapra is larger, swifter, and wilder, than the common rock-goat, and can scarcely be taken without a falcon. It is met with near Aleppo. I have seen a variety of this which is common in the East, and the horns appear different; perhaps it is a distinct species. This animal loves the smoke of tobacco; and, when caught alive, will approach the pipe of the huntsman, though otherwise more timid than any animal. This is perhaps the only creature, besides man, that delights in the smell of a poisonous and stinking plant. The Arabians hunt it with a falcon (*falco gentilis*, Lin.) I had an excellent opportunity of seeing this sport near Nazareth in Galilee. An Arab, mounted on a swift courser, held the falcon in his hand, as huntsmen commonly do: when he espied the rock-goat on the top of a mountain, he let loose the falcon, which flew in a direct line like an arrow, and attacked the animal; fixing the talons of one of his feet into the cheek of the creature, and the other into its throat, extending his wings obliquely over the animal; spreading one towards one of its ears, and the other to the opposite hip. The animal, thus attacked, made a leap twice the height of a man, and freed himself from the falcon: but being wounded, and losing his strength and speed, he was again attacked by the falcon; which fixed the talons of both its feet into the throat of the animal, and held it fast, till the huntsman coming up, took it alive, and cut its throat; the falcon drinking the blood as a reward for his labour. A young falcon, which was learning, was likewise put to the throat of the goat: by this means are young falcons taught to fix their talons in the throat of the animal, as being the properest part; for should the falcon fix them in the creature's hip, or some other part of the body, the huntsman would not only lose his game, but his falcon also: for the animal, roused by the wound, which could not prove mortal, would run to the deserts and the tops of the mountains, whither its enemy, keeping its hold, would be obliged to follow; and, being separated from its master, must of course perish."

IX. The *BEZOARTICA*, or bezoar goat, is bearded, and has cylindrical, arched, and wholly annulated horns. It is a native of Persia. The bezoar is found in one of its stomachs, called *abomasus*. See *BEZOAR* and *ABOMASUS*.

X. The *TARTARICA*, or saiga of Buffon, has cylindrical, straight, annulated horns; the points inclining inward, the ends smooth; the other part surrounded with very prominent annuli; of a pale yellow colour, and the greatest part semipellucid; the cutting teeth are placed so loose in their sockets, as to move with the least touch. The male is covered with rough hair like the he-goat, and has a very strong smell; the female is smoother. The hair on the bottom of the sides and the throat is long, and resembles wool; that on the sides of the neck and head is hoary; the back and sides of a dirty white; the breast, belly, and inside of the thighs, of a shining white. The females are destitute of horns. These animals inhabit all the deserts from the Danube and Dnieper to the river Irtysh, but not beyond. Nor are they ever seen to the north of 54 or 55 degrees of latitude. They are found therefore in Poland, Moldavia, about Mount Caucasus, and the Caspian Sea, and Siberia, in the dreary open deserts, where salt-springs abound, feeding on the salt, the acrid and aromatic plants of those countries, and grow in the summer-time very fat: but their flesh acquires a taste disagreeable to many people, and is scarcely eatable, until it is suffered to grow cold after dressing. The females go with young the whole winter; and bring forth in the northern deserts in May. They have but one at a time; which is singular, as the numbers of these animals are prodigious. The young are covered with a soft fleece, like new-dropt lambs, curled and waved. They are regularly migratory. In the rutting-season, late in autumn, they collect in flocks of thousands, and retire into the southern deserts. In the spring they divide into little flocks, and return northward at the same time as the wandering Tartars change their quarters.

They very seldom feed alone; the males feeding promiscuously with the females and their young. They rarely lie down all at the same time: but, by a providential instinct, some are always keeping watch; and when they are tired, they seemingly give notice to such as have taken their rest, who arise instantly, and as it were relieve the sentinels of the preceding hours. They thus often preserve themselves from the attack of wolves, and from the surprize of the huntsmen. They are excessively swift, and will outrun the fleetest horse or greyhound; yet partly through fear (for they are the most timid of animals), and partly by the shortness of their breath, they are very soon taken. If they are but bit by a dog, they instantly fall down, nor will they even offer to rise. In running they seem to incline on one side, and their course is so rapid that their feet seem scarcely to touch the ground. In a wild state they seem to have no voice. When brought up tame, the young emit a short sort of bleating, like sheep.

The males are most libidinous animals: the Tartars, who have sufficient time to observe them, report that they will copulate twenty times together; and that this ability arises from their feeding on a certain herb, which has most invigorating powers. When taken

VOL. IV. Part I.

young, they may easily be made tame; but if caught when at full age, are so wild and so obstinate as to refuse all food. When they die, their noses are quite flaccid.

They are hunted for the sake of their flesh, horns, and skins, which are excellent for gloves, belts, &c. The huntsmen always approach them against the wind, lest they should smell their enemy; they also avoid putting on red or white clothes, or any colours which might attract their notice. They are either shot, or taken by dogs; or by the black eagle, which is trained to this species of falconry. Their best season is in September: at other times, the skins are penetrated by worms. The fat resembles that of mutton; in taste, like that of a buck: the head is reckoned the most delicate part.

XI. The *AMMON*, has semicircular, plain, white horns, and no beard. It is about the size of a ram, and is a native of Siberia.

XII. The *ÆGAGRUS* of Pallas, or Caucasian goat, has smooth black horns, sharply ridged on their upper parts, and hollowed on their outward sides. No vestiges of knots or rings, but on the upper surface are some wavy risings; bend much back, and are much hooked at the end, approaching a little at the points. On the chin is a great beard, dusky, mixed with chestnut. The forepart of the head is black, the sides mixed with brown; the rest of the animal grey, or grey mixed with rust-colour. Along the middle of the back, from the neck to the tail, is a black list; and the tail is black.

The female is either destitute of horns, or has very short ones. In size it is superior to the largest he-goats, but in form and agility resembles a stag: yet Monardus compares it to the he-goat, and says that it has the feet of the goat. They inhabit the lower mountains of Caucasus and Taurus, all Asia Minor, and perhaps the mountains of India. They abound on the inhospitable hills of Laar and Khorazan in Persia; and according to Monardus are also found in Africa. It is an animal of vast agility. Monardus was witness to the manner of its saving itself from injury by falling on its horns; for he saw that which he describes leap from a high tower, precipitating itself on its horns; then springing on its legs, and leaping about, without receiving the least harm. This is one of the animals which yields the once-valued alexipharmic, the Bezoar-stone; which is a concretion formed of many coats, incrusting a nucleus of small pebble, stones of fruits, bits of straw, or buds of trees. The incrusting coats are created from the vegetable food of the animals, especially the rich, dry, and hot herbs of the Persian and Indian mountains. Its virtues are now exploded, and it is reckoned only an absorbent, and that of the weakest kind.

XIII. The *GNOU*, with scabrous horns, and thick at the base, bending forward close to the head, then suddenly reverting upwards. The mouth is square; the nostrils covered with broad flaps. From the nose, half way up the front, is a thick oblong-square brush of long stiff black hairs reflected upwards, on each side of which the other hairs are long, and point closely down the cheeks. Round the eyes are disposed in a radiated form several strong hairs. The neck is short, and a little arched. On the top a strong and upright mane, reaching from the horns beyond the shoulders. On

T

the

Capra.

Capra.

the chin is a long white beard; and on the gullet a very long pendulous bunch of hair. On the breast, and between the fore-legs, the hairs are very long and black. The tail reaches to the first joint of the legs, and is full of hair like that of a horse, and quite white. The body is thick; and covered with smooth short hair of a rust brown colour tipped with white. The legs are long, elegant, and slender, like those of a stag. On each foot is only a single spurious or hind hoof.—It is a strange compound of animals: having a vast head like that of an ox; body and tail, like a horse; legs like a stag; and the sinus lacrymalis of an antelope. The ordinary size of it is about that of a common galloway; the length of it being somewhat above five, and height of it rather more than four feet.—These animals inhabit in great numbers the fine plains of the great Namacquas, far north of the Cape of Good Hope, extending from S. lat. 25. to 28. 42. where Africa seems at once to open its vast treasures of hoofed quadrupeds. It is an exceedingly fierce animal: on the sight of any body it usually drops its head, and puts itself into an attitude of offence; and will dart with its horns against the pales of the inclosure towards the persons on the outside; yet it will afterwards take the bread which is offered. It will often go upon its knees, run swiftly in that singular posture, and furrow the ground with its horns and legs. The Hottentots call it *Gnou* from its voice. It has two notes, one resembling the bellowing of an ox, the other more clear. It is called an ox by the Europeans.

XIV. The *DORCAS*, or antelope, has cylindrical annulated horns, bent backward, contorted, and arising from the front between the eyes. It is a native of Africa and Mexico. These animals are of a most elegant and active make; of a restless and timid disposition; extremely watchful; of great vivacity; remarkably swift; exceedingly agile; and most of their boundings so light, so elastic, as to strike the spectator with astonishment. What is very singular, they will stop in the middle of their course, for a moment gaze at their pursuers, and then resume their flight.

As the chase of these animals is a favourite diversion with the eastern nations, from that may be collected proofs of the rapid speed of the antelope tribe. The greyhound, the fleetest of dogs, is unequal in the course; and the sportsman is obliged to call in the aid of the falcon trained to the work, to seize on the animal and impede its motions, to give the dogs time to overtake it. In India and Persia a sort of leopard is made use of in the chase: this is an animal that takes its prey, not by swiftness of foot, but by the greatness of its springs, by motions similar to that of the antelope; but should the leopard fail in its first essay, the game escapes.

The fleetness of this animal was proverbial in the country it inhabited even in the earliest times: the speed of Asahel is beautifully compared to that of the tzebi; and the Gadites were said to be as swift as the roes upon the mountains. The sacred writers took their similes from such objects as were before the eyes of the people they addressed themselves to. There is another instance drawn from the same subject: the disciple raised to life at Joppa was supposed to have been called *Tabitha*, i. e. *Dorcas*, or the *Antelope*, from

the beauty of her eyes; and this is still a common comparison in the east: *Aine el Cxazel*, or, "You have eyes of an Antelope," is the greatest compliment that can be paid to a fine woman.

Some species of the antelopes form herds of 2000 or 3000, while others keep in small troops of five or six. They generally reside in hilly countries; though some inhabit plains: they often browse like the goat, and feed on the tender shoots of trees, which gives their flesh an excellent flavour. This is to be understood of those that are taken in the chase; for those that are fattened in houses are far less delicious. The flesh of some species are said to taste of musk, which perhaps depends on the qualities of the plants they feed on.

Mr Pennant makes the antelope a distinct genus of animals, forming a link between the goat and the deer; with the first of which they agree in the texture of the horns, which have a core in them, and they never cast them; with the last, in the elegance of their form, and great swiftness. He distinguishes several species, among which he ranks the *gazella*, the *cervicapra*, the *bezoartica*, and the *tartarica* of Linnæus, described above, VII. VIII. IX. X. with the *moschus grimmia* of the same author. See *MOSCHUS*.

The other species of antelopes distinguished by zoologists are:

1. *Kevella* of Pallas, or flat-horned antelope, has horns twelve inches long, flattened on their sides, inclining first backwards, bending in the middle, and then reverting forwards at their ends, and annulated with from fourteen to eighteen rings: the upper side of the body is reddish brown; lower part and buttocks are white: the size equal to a small roebuck. They inhabit Senegal; where they live in great flocks, are easily tamed, and are excellent meat.

2. The corine antelope, with very slender horns, six inches long, surrounded with circular *rugæ*: on each side of the face is a white line; beneath that, is one of black: the neck, body, and flanks are tawny; belly and inside of the thighs white: on the knees is a tuft of hair. It is less than a roebuck, and inhabits Senegal.

3. The nagor, or red antelope, with horns 5½ inches long; one or two slight rings at the base: ears much longer than the horns: hair stiff and bright; in all parts of a reddish colour, palest on the chest: tail very short. Inhabits Senegal and the Cape; where it is very frequent, and is a common food.

4. The dama or swift antelope (*le Nanguer*, Buff.), with round horns, eight inches long, reverting at their ends. The general colour is tawny; but this species varies in that particular. It inhabits Senegal; and is easily tamed. It is very swift: Ælian compares its flight to the rapidity of a whirlwind.

5. The elk-antelope of Sparman (Indian antelope of Pennant), has thick straight horns, marked with two prominent spiral ribs near two thirds of their length, smooth towards their end; some above two feet long. The head is of a reddish colour, bounded on the cheeks by a dusky line. The forehead is broad; the nose pointed. On the forehead is a stripe of long loose hairs; and on the lower part of the dewlap, a large tuft of black hair. Along the neck and back, from head to tail, is a black short mane: the rest of the body is of a bluish grey, tinged with red. The tail does not reach to the first joint of the leg; is covered with short

Capra.

Capra.

cinereous hair; and the end tufted with long black hairs. The hoofs are short, surrounded at their junction with the legs by a circle of black hairs. The height to the shoulders is five feet. It is thick bodied and strongly made; but the legs are slender. It wants the *sinus lacrymalis*. The females are horned like the males.—The Caffres call this species *empofos* and *posfo*. The Dutch of the Cape call it the *eland* or *elk*. M. de Buffon, by mistake, calls this the *condous*, which he ought to have bestowed on his *condoma*. It inhabits India, Congo, and the southern parts of Africa. They live in herds; but the old males are often solitary. They grow very fat, especially about the breast and heart: so that they are easily caught; and when pursued, will sometimes fall dead in the chase. They are slow runners: when roused, always go against the wind, nor can the hunters (even if they front the herd) divert them from their course. The flesh is fine-grained, very delicious, and juicy. The hide is tough: the Hottentots make tobacco-pipes of the horns.

6. The cervine antelope, or *antelope bubalis* of Pallas, with horns bending outward and backward, almost close at their base, and distant at their points; twisted and annulated; very strong and black: the head is large, and like that of an ox: the eyes are placed very high, and near to the horns: the form of the body is a mixture of the stag and heifer; height to the top of the shoulders four feet: the tail is rather more than a foot long, asinine, and terminated with a tuft of hair: the colour a reddish brown; white about the rump, the inner side of the thighs, and lower part of the belly: a dark space occupies the top of the back, the front of the upper part of the fore legs, and hinder part of the thighs. It inhabits Barbary, and probably other parts of Africa, being also found towards the Cape of Good Hope. It is the *bekker el wasb* of the Arabs, according to Dr Shaw; who says, that its young quickly grow tame, and herd with other cattle. Mr Forskal mentions it among the Arabian animals of an uncertain genus, by the name of *bakar uafch*. This is the *bubalus* of the ancients; not the buffalo, as later writers have supposed. The Dutch of the Cape call this species *hartebeest*. They go in great herds; few only are solitary. They gallop seemingly with a heavy pace, yet go swiftly. They drop on their knees to fight like the white-footed antelope or nil-gbau, and the bosch-bok, after-described. The flesh is fine grained, but dry.—Mr Sparman informs us, that in this animal there is a pore one line in diameter, an inch or an inch and a half below and before the internal angle of the eye. From this pore, which is the aperture of a caruncle that lies below, there is secreted a matter almost like ear-wax, which he observed the Hottentots kept in a piece of skin as a rare and excellent medicine; on the dried skin of the animal, this pore is scarcely to be discerned. This Mr Sparman supposes is the reason why so great and accurate a zoologist as M. Pallas (who describes it in his *Spicilegia* under the denomination of *Antelope bubalis*) makes no mention of this pore, as he made his descriptions chiefly from the dried skins of this animal. The use of this pore, which is also found in the deer, is for affording freer respiration, a circumstance so essential to beasts of chase. See CERVUS.

7. The springer, with slender horns, annulated half way, and twice contorted. The ears very long and

dusky. The face, cheeks, nose, chin, and throat, are white. The whole upper side of the neck, part of the lower, the back, sides, and outside of the limbs, are of a pale yellowish brown. The chest, belly, and inside of the limbs, are white; the sides and belly divided by a broad band of chestnut, which runs down part of the shoulders. The tail reaches to the first joint of the leg; the upper part white; the lower black, and furnished with long hair. The buttocks are white; and from the tail half way up the back is a stripe of white, expansible at pleasure. This elegant species weighs about fifty pounds, and is rather less than a roebuck. It inhabits the Cape of Good Hope, where it is called the *spring-bock*, from the prodigious leaps it takes on the sight of any body. When alarmed, it has the power of expanding the white space about the tail into the form of a circle, which returns to its linear form when the animal is tranquil. These animals migrate annually from the interior parts in small herds, and continue in the neighbourhood of the Cape for two or three months: then join companies, and go off in troops consisting of many thousands, covering the great plains for several hours in their passage. They are attended in their migrations by numbers of lions, hyænas, and other wild beasts, which make great destruction among them. They are excellent eating, and with other antelopes are the venison of the Cape. Mr Mason* informs us, that they also make periodical migrations, in seven or eight years, in herds of many hundred thousands, from the north, as he supposes from the interior parts of *Terra de Natal*. They are compelled to it by the excessive drought which happens in that region, when sometimes there does not fall a drop of rain for two or three years. These animals in their course desolate Caffraria, spreading over the whole country, and not leaving a blade of grass. Lions attend them; where one of those beasts of prey are, his place is known by the vast void visible in the middle of the timorous herd.

8. The striped antelope, has smooth horns, twisted spirally, and compressed sideways, with a ridge on one side following the wreaths: they consist of three bends; and are sometimes four feet and a half long measured in a straight line. They are naturally of a dusky colour, and wrinkled; but are generally brought over highly polished. The females are destitute of horns. In the upper jaw is a hard horny substance, disposed in ridges. The length of the animal is nine feet; the legs are slender: the general colour is of a reddish cast, mixed with grey; and from the tail, along the top of the back, to the shoulders, is a white stripe; from which are seven others, four pointing towards the thighs, and three towards the belly; but they vary in number of stripes. On the upper part of the neck is a short mane: beneath the neck, from the throat to the breast, are some long hairs hanging down. It inhabits the Cape of Good Hope, where it is called *coedoes*, and is said to leap to a most astonishing height. This species wants the *sinus lacrymalis*.

9. The bosch-bok, or wood-goat of the Cape, a species of antelope, according to Mr Sparman, unknown to all the cultivators of natural history, whether ancient or modern, till he described it in the memoirs of the Swedish academy for the year 1780, quarter 3d, by the name of *antelope sylvatica*. This animal

Capra.

* P&H.
Trans.
vol. lxvi.
p. 103.

Capra.

has obtained the name it goes by, in consequence of its being the only one among the gazels in Africa, which may be properly said to live in the woods and groves. In size, the bosch-bok is somewhat above two feet and a half high. The horns are ten inches and a half long; the ears half the length of the horns, or five inches.—The horns are black, in some measure triangular, and at the same time wreathed, so that both the sides and angles have somewhat of a spiral turn. At bottom they are rather rough, in consequence of a set of almost innumerable wavy-rings; which, however, are not elevated much above the surface. At top they are conical and sharp-pointed, and in that part as smooth as though they had been polished. The teeth of this animal are like those of other antelopes. It has no fore teeth or *incisores* except in the lower jaw, where it has eight.—There is no *porus ceriferus* in this, as there is in some other antelopes. The hairs on the head are very short and fine; afterwards they become more rough and rugged, resembling goats hair more than that of gazels or harts. Forwards on the neck, breast, sides, and belly, they are an inch and a half or two inches long. On the ridge of the neck, and so on all along that of the back, they are three or four inches in length, so as to form a kind of mane there, terminating in a tail about a finger's breadth long. On the hind part of the thighs and buttocks likewise, the hairs are eight inches long; the legs and feet are slender, and covered with short hairs; the fetlock-joints are small; the nose and under-lip are decorated with black whiskers about an inch long. The predominant colour in this animal is dark-brown, which occupies the principal part of the sides, the back, the upper part of the tail, the upper part of the chest and fore-ribs, and the fore-part of the belly. A still darker brown, bordering upon black, is discoverable on the outside of the shoulders, and some part of the fore-ribs. The fore-part of the nose, from the eyes to the muzzle, is of a foot colour. The ears are likewise as black as foot on the outside, but on the inside grey; and both outwards and inwards covered with hairs still shorter than those on the head; excepting half the fore-part of the lower edge, where the hairs are white and half an inch long. Divers small white spots, from nine to twelve in all, are seen on each of the haunches and on the sides near them. A narrow line of long white hairs extends from the neck all along the back and tail, in the midst of the long brown hairs already described. From the chine of the back to the sides run five white parallel streaks, which, however, are only discoverable by a close inspection.

This creature does much mischief to the vineyards and kitchen-gardens of the Cape colonists; and it shows a great deal of craft and artifice in avoiding the snares and traps set for it, as well as the ambuscades of the sportsmen. As the *bosch-bok* runs but slowly, it sometimes happens that he is caught by dogs. When he sees there is no other resource, he puts himself in a posture of defence; and when he is going to butt, kneels down, like the white-footed antelope and the hartbeest. The colonists are not very fond of hunting him in this manner, as the beast on this occasion generally sells his life at a very dear rate, by going and killing some of their best and most spirited hounds. This creature's horns, which are its chief

defence, sometimes also prove its bane, by being entangled in the bushes and small branches of trees, which thus stop the beast in its flight. In some measure to avoid this, it carries its nose horizontally and straight forward while it runs; so that its horns lie, as it were, directly on its neck: notwithstanding which, their horns are generally worn away a little on the fore part, and thus acquire some degree of polish.—This species of antelope is monogamous, or keeps in pairs. It is swifter in woodlands than the dogs, which likewise sooner lose scent of him there. The female, which is without horns, and on that account runs about in the forest more free and unimpeded, does not suffer herself so easily to be hunted out of the woods, having there, as well as on the plains, a more certain defence against the dogs in her legs, than the male has in his horns, especially as she is not so bulky and heavy as the male. Her breast is said to be very plump and fleshy, but the flesh in general is not very tender.

10. The leucoryx with the nose thick and broad, like that of a cow; the ears somewhat slouching; body clumsy and thick: The horns long, very slightly incurvated, slender, annulated part of the way; black, pointed. The tail reaching to the first joint of the legs, and tufted. The colour is in all parts a snowy whiteness, except the middle of the face, sides of the cheeks, and limbs, which are tinged with red.—This species is about the size of a Welch runt; and inhabits Gow Bahrein, an isle in the gulph of Bassora.

11. The picta, white-footed antelope, or nyl-ghau; with short horns, bending a little forward; ears large, marked with two black stripes; a small black mane on the neck, and half way down the back: a tuft of long black hairs on the fore-part of the neck; above that, a large spot of white; another between the fore-legs on the chest: one white spot on each fore-foot; two on each hind-foot: the tail is long, tufted with black hairs. The colour of the male is a dark grey. The female is of a pale brown colour; with a mane, tuft, and striped ears, like the male; on each foot three transverse bands of black and two of white: It is destitute of horns. The height to the top of the shoulders is four feet and an inch; the length from the bottom of the neck to the anus, four feet. The head is like that of a stag; the legs are delicate.—These animals inhabit the distant and interior parts of India, remote from our settlements. They are brought down as curiosities to the Europeans, and have of late years been frequently imported into England. In the days of Aurenge Zebe, they abounded between Delhi and Lahor, on the way to Cachemire. They were called *nyl-ghau*, or *blue or grey bulls*; and were one of the objects of chase, with that mighty prince, during his journey. They were inclosed by his army of hunters within nets, which being drawn closer and closer, at length formed a small precinct: into this the king, his omrahs, and hunters, entered, and killed the beasts with arrows, spears, or muskets; and so netimes in such numbers, that Aurenge Zebe used to send quarters as presents to all his great people. They are usually very gentle and tame, will feed readily, and lick the hands which give them food. In confinement they will eat oats, but prefer grass and hay; are very fond of wheaten bread; and when thirsty, they will drink

two gallons at a time. They are said to be at times very vicious and fierce. When the males fight, they drop on their knees at a distance from one another, make their approaches in that attitude, and when they come near, spring and dart at each other. They will often, in a state of confinement, fall into that posture without doing any harm. They will, notwithstanding, attack mankind unprovoked. A labourer, who was looking over some pales which inclosed a few of them, was alarmed by one of the males flying at him like lightning; but he was saved by the intervention of the woodwork, which it broke to pieces, and at the same time one of its horns.—They have bred in England. They are supposed to go nine months with young, and have sometimes two at a birth.

12. The scripta or harnessed antelope (*le guib*, Buff.), has straight horns nine inches long, pointing backwards, with two spiral ribs. The general colour is a deep tawny; but the sides are most singularly marked with two transverse bands of white, crossed by two others from the back to the belly; the rump with three white lines pointing downwards on each side; and the thighs are spotted with white. The tail is ten inches long, covered with long rough hairs.—It inhabits the plains and woods of Senegal, living in large herds. It is frequent at the Cape, where it is called the *bonte-bok*, or *spotted goat*.

CAPRA-Saltans, in meteorology, a fiery meteor or exhalation sometimes seen in the atmosphere. It forms an inflected line, resembling in some measure the caperings of a goat; whence it has its name.

CAPRALA, an isle of Italy, in the Tuscan sea, to the north-east of Corsica, on which it depends. It is pretty populous, and has a strong castle for its defence. It is about 15 miles in circumference. E. Long. 11. 5. N. Lat. 43. 15.

CAPRARIA, in botany: A genus of the angiospermia order, belonging to the didynamia class of plants; and in the natural method ranking under the 40th order, *Personata*. The calyx is quinquepartite; the corolla campanulated, quinquefid, with acute segments; the capsule bivalved, bilocular, and polyspermous. There is but one species, the *biflora*, which is a native of the warm parts of America. Being a troublesome weed, and without beauty, it is never cultivated, except in botanic gardens for the sake of variety.

CAPRAROLA, one of the most magnificent palaces in Italy, seated on a hill, in Ronciglione, whose foot is watered by the river Tircia. It was built by cardinal Farnese; and has five fronts, in the middle of which is a round court, though all the rooms are square, and well proportioned. It is 27 miles north-west of Rome.

CAPREÆ. See CAPRI.

CAPREOLUS (Elias), an excellent civilian, and learned historian, born in Brescia in Italy, wrote an history of Brescia, and other works: died in 1519.

CAPRI, (anciently *Caprea*), a city and island at the entrance of the gulph of Naples, E. Long. 14. 50. N. Lat. 40. 45.—The island is only four miles long and one broad; the city is a bishop's see, situated on a high rock at the west end of the island. Capreæ was anciently famous for the retreat of the emperor Tibe-

rius for seven years, during which he indulged himself in the most scandalous debaucheries*. Before Tiberius came hither, Capri had attracted the notice of Augustus, as a most eligible retreat, though in sight of populous cities, and almost in the centre of the empire. His successor preferred it to every other residence; and in order to vary his pleasures, and enjoy the advantages as well as avoid the inconveniences of each revolving season, built twelve villas in different situations, dedicated to the twelve greater gods: the ruins of some of them are still to be seen: at Santa Maria are extensive vaults and reservoirs; and on an adjoining brow are the remains of a light-house; two broken columns indicate the entrance of the principal court. According to Dion Cassius, this island was wild and barren before the Cæsars took it under their immediate protection: at this day a large portion of its surface is uncultivated and impracticable; but every spot that will admit the hoe is industriously tilled, and richly laden with the choicest productions of agriculture. The odium attached to the memory of Tiberius proved fatal to his favourite abode; scarce was his death proclaimed at Rome, when the senate issued orders for the demolition of every fabric he had raised on the island, which by way of punishment was thenceforward destined to be a state prison. The wife and sister of Commodus were banished to its inhospitable rocks, which were soon stained with their blood. In the middle ages Capri became an appendage of the Amalfitan republic, and after the downfall of that state, belonged to the duchy of Naples. There stood a pharos on this island, which, a few days before the death of Tiberius, was overthrown by an earthquake.

CAPRIATA (Peter John), a civilian and historian, was born at Genoa. He wrote, in Italian, the history of the wars of Italy; an English translation of which was printed in London in 1663.

CAPRICORN, in astronomy, one of the 12 signs of the zodiac. See ASTRONOMY, n° 404.

The ancients accounted Capricorn the tenth sign; and when the sun arrived thereat, it made the winter solstice with regard to our hemisphere: but the stars having advanced a whole sign towards the east, Capricorn is now rather the 11th sign; and it is at the sun's entry into Sagittary that the solstice happens, though the ancient manner of speaking is still retained.

This sign is represented on ancient monuments, medals, &c. as having the forepart of a goat and the hindpart of a fish, which is the form of an *Ægipan*; sometimes simply under the form of a goat.

Tropic of CAPRICORN, a lesser circle of the sphere, which is parallel to the equinoctial, and at 23° 30' distance from it southwards; passing through the beginning of Capricorn.

CAPRIFICATION, a method used in the Levant, for ripening the fruit of the domestic fig-tree, by means of insects bred in that of the wild fig-tree.

The most ample and satisfactory accounts of this curious operation in gardening are those of Tournefort and Pontedera: the former, in his *Voyage to the Levant*, and in a *Memoir* delivered to the academy of sciences at Paris in 1705; the latter, in his *Anthologia*. The substance of Tournefort's account follows: "Of the thirty species or varieties of the domestic fig-tree which are cultivated in France, Spain, and Italy, there

Capri
||
Caprification.

* See Tiberius.

Caprifica-
tion.

are but two cultivated in the Archipelago. The first species is called *ornos*, from the old Greek *erinos*, which answers to *caprificus* in Latin, and signifies a wild fig-tree. The second is the domestic or garden fig-tree. The former bears successively, in the same year, three sorts of fruit, called *foraites*, *cratitres*, and *orni*; which, though not good to eat, are found absolutely necessary towards ripening those of the garden-fig. These fruits have a sleek even skin; are of a deep green colour; and contain in their dry and mealy inside several male and female flowers placed upon distinct foot-stalks, the former above the latter. The *foraites* appear in August, and continue to November without ripening: in these are bred small worms, which turn to a sort of gnats nowhere to be seen but about these trees. In October and November, these gnats of themselves make a puncture into the second fruit, which is called *cratitres*. These do not show themselves till towards the end of September. The *foraites* gradually fall away after the gnats are gone; the *cratitres*, on the contrary, remain on the tree till May, and inclose the eggs deposited by the gnats when they pricked them. In May, the third sort of fruit, called *orni*, begins to be produced by the wild fig-trees. This is much bigger than the other two; and when it grows to a certain size, and its bud begins to open, it is pricked in that part by the gnats of the *cratitres*, which are strong enough to go from one fruit to another to deposit their eggs. It sometimes happens that the gnats of the *cratitres* are slow to come forth in certain parts, while the *orni* in those very parts are disposed to receive them. In this case, the husbandman is obliged to look for the *cratitres* in another part, and fix them at the ends of the branches of those fig-trees whose *orni* are in a fit disposition to be pricked by the gnats. If they miss the opportunity, the *orni* fall, and the gnats of the *cratitres* fly away. None but those that are well acquainted with the culture know the critical moment of doing this; and in order to know it, their eye is perpetually fixed on the bud of the fig; for that part not only indicates the time that the prickers are to issue forth, but also when the fig is to be successfully pricked: if the bud is too hard and compact, the gnat cannot lay its eggs; and the fig drops when the bud is too open.

"The use of all these three sorts of fruit is to ripen the fruit of the garden fig-tree, in the following manner. During the months of June and July, the peasants take the *orni*, at the time their gnats are ready to break out, and carry them to the garden fig-trees: if they do not nick the moment, the *orni* fall; and the fruit of the domestic fig-tree, not ripening, will in a very little time fall in like manner. The peasants are so well acquainted with these precious moments, that, every morning, in making their inspection, they only transfer to their garden fig-trees such *orni* as are well conditioned, otherwise they lose their crop. In this case, however, they have one remedy, though an indifferent one; which is, to strew over the garden fig-trees another plant in whose fruit there is also a species of gnats which answer the purpose in some measure."

The caprification of the ancient Greeks and Romans, described by Theophrastus, Plutarch, Pliny, and other authors of antiquity, corresponds in every circumstance with what is practised at this day in the Archipelago and in Italy. These all agree in declaring, that the wild fig-tree, *caprificus*, never ripened its

fruit; but was absolutely necessary for ripening that of the garden or domestic fig, over which the husbandmen suspended its branches. The reason of this success has been supposed to be, that by the punctures of these insects the vessels of the fruit are lacerated, and thereby a greater quantity of nutritious juice derived thither. Perhaps, too, in depositing their eggs, the gnats leave behind them some sort of liquor proper to ferment gently with the milk of the figs, and to make their flesh tender. The figs in Provence, and even at Paris, ripen much sooner for having their buds pricked with a straw dipped in olive-oil. Plums and pears likewise, pricked by some insects, ripen much the faster for it; and the flesh round such puncture is better tasted than the rest. It is not to be disputed, that considerable changes happen to the contexture of fruits so pricked, just the same as to parts of animals pierced with any sharp instrument. Others have supposed that these insects penetrated the fruit of the tree to which they were brought, and gave a more free admission to the air, and to the sun. Linnæus explained the operation, by supposing that the insects brought the farina from the wild fig, which contained male flowers only, to the domestic fig, which contained the female ones. Hasselquist, from what he saw in Palestine, seemed to doubt of this mode of fructification. M. Bernard, in the Memoirs of the Society of Agriculture, opposes it more decidedly. He could never find the insect in the cultivated fig; and, in reality, it appeared to leave the wild fig, after the stamina were mature, and their pollen dissipated: besides, he adds, what they may have brought on their wings must be rubbed away, in the little aperture which they would form for themselves. At Malta, where there are seven or eight varieties of the domestic fig, this operation is only performed on these which ripen latest: the former are of a proper size, fine flavour, and in great abundance without it; so that he thinks the caprification only hastens the ripening. He examined the parts of fructification of the fig; and he observes, if this examination be made previous to the ripening, that round the eye of the fig, and in the substance of its covering, may be seen triangular dentated leaves, pressed one against another; and under these leaves are the stamina, whose pollen is destined for the impregnation of the grains, which fill the rest of the fruit. These male organs are much more numerous in the wild fig than in the domestic; and the stamina are found to contain a yellow dust, which may be collected when it is ripe. The wild figs, when ripe, are not succulent, and have no taste, though the grains are disposed in the same manner as in the other kind. The pith of the grain of the wild fruit serves as food to a species of the cynips, whose larva is white, till the moment of its transformation; and it is by an opening, in the direction of the pistil, that the insect penetrates the grain. From this account it is thought probable that the insect is only communicated by accident to the domestic fig, and that the flowers of this genus are sometimes hermaphrodites. But the number of hermaphrodite flowers being fewer on the cultivated than on the wild fig, the seeds are fecundated more certainly and quickly by the caprification; and every botanist knows, that when the impregnation is completed, the flower soon withers; while, if by any accident it is delayed, it continues in bloom much longer. This view of the subject, there-

Caprifica-
tion.

Caprimul-
gus.

fore, explains very completely the reason why, in Malta, the caprifigation is practised on the late kind of figs, because it hastens the formation and maturity of the fruit.

CAPRIMULGUS, GOAT-SUCKER, or *Fern-owl*, in ornithology, a genus of birds belonging to the order of passerines. The beak is incurved, small, tapering, and depressed at the base; the mouth opens very wide.

1. The *Europæus*, with the tubes of the nostrils hardly visible. It feeds on moths, gnats, dorrs, or chaffers; from which Charleton calls it a *dorr-bawk*, its food being entirely of that species of beetle during the month of July, the period of that insect's flight in this country. This bird migrates. It makes but a short stay with us: appears the latter end of May; and disappears, in the northern parts of our island, the latter end of August; but, in the southern, stays above a month later. It inhabits all parts of Britain from Cornwall to the county of Ross. Mr Scopoli seems to credit the report of their sucking the teats of goats, an error delivered down from the days of Aristotle. Its notes are most singular. The loudest so much resembles that of a large spinning wheel, that the Welsh call this bird *aderyn y droell*, or the wheel-bird. It begins its song most punctually on the close of day, sitting usually on a bare bough, with the head lower than the tail, the lower jaw quivering with the efforts. The noise is so very violent, as to give a sensible vibration to any little building it chanced to alight on and emit this species of note. The other is a sharp squeak, which it repeats often; this seems a note of love, as it is observed to reiterate it when in pursuit of the female among the trees. It lays its eggs on the bare ground; usually two: they are of a long form, of a whitish hue, prettily marbled with reddish brown. The length of this bird is $10\frac{1}{2}$ inches; extent 22. Plumage, a beautiful mixture of white, black, ash-colour, and ferruginous, disposed in lines, bars, and spots. The male is distinguished from the female by a great oval white spot near the end of the three first quill-feathers, and another on the outmost feathers of the tail. This is the only one of the genus which is found in Europe. A variety less in size, being only eight inches in length, inhabits Virginia, in summer: arrives there towards the middle of April, and frequents the mountainous parts, but will frequently approach the houses in the evening, where it settles on a rail or post, and cries for several times together very loud, somewhat like the word *whiperiwhip*, or *whippoorwill*, the first and last syllables pronounced the loudest. After continuing in one place for some time, it flies to another, and does the same; sometimes four or five cry all together: this noise it begins just after sun-set, and continues at intervals till just before sunrise. It does not catch insects always on the wing; for it frequently sits upon a convenient place, and leaps up after them as they fly by, and returns to the same spot again. It makes no nest, but lays the eggs, which are two in number, and of a dull green with dusky spots and streaks, on the bare ground in the open fields. Kalm says that the flesh is good to eat. Another variety, larger, inhabits Virginia and Carolina; where it is called the *rain-bird*, because it never appears in the day-time, except when the sky, being obscured with clouds, betokens rain. It is said to lay the eggs on the ground, and that they are not unlike those of the Lapwing.

2. The *Americanus*, has the tubes of the nostrils very conspicuous. It is a night bird, and is found in America.

There are several other species or varieties inhabiting different countries, and differently marked, but all nearly similar in their manners.

CAPRIOLES, in the manege, leaps that a horse makes in the same place without advancing, in such a manner, that, when he is at the height of the leap, he jerks out with his hinder legs even and near. It is the most difficult of all the high manege. It differs from a croupade, in this, that, in a croupade, a horse does not show his shoes; and from a ballotade, because in this he does not jerk out. To make a horse work well at caprioles, he must be put between two pillars, and taught to raise first his fore-quarters, and then his hind-quarters while his fore ones are yet in the air; for which end you must give him the whip and the poinçon.

CAPSA (anc. geog.), a large and strong town of Numidia, situated amidst vast deserts, waste, uncultivated, and full of serpents, where Jugurtha kept his treasure. In his time it was taken and rased by Marius the Roman general, who put to death all the citizens capable of bearing arms, and sold the rest for slaves. It was, however, afterwards rebuilt by the Romans, and strongly fortified; but, on the decline of their empire, was taken and demolished a second time, by Ocuba a famous Arab general. The walls of the citadel are still remaining, and are monuments of the ancient glory and strength of Capsa. They are 24 fathoms in height, and five in thickness, built of large square stones, and have now acquired the solidity and firmness of a rock. The walls of the town were rebuilt by the inhabitants since their first demolition; but were afterwards destroyed by Jacob Almanzar, who sent a governor and troops into the province. In Marmol's time Capsa was very populous, and abounded with stately mosques and other structures of superb and elegant workmanship: but at present it is occupied by a poor and indigent people, fleeced and oppressed by the Tunese government. In the very centre of the city stands an inclosed fountain, which both supplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated, and produces several kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peevishness of temper. Both men and women dress handsomely except their feet, which they cover with coarse shoes of bungling workmanship, and made of the rough skins of wild beasts, equally inconvenient and unbecoming. E. Long. 9. 3. N. Lat. 33. 15.

CAPSARIUS, from *capsa*, satchel, in antiquity, a servant who attended the Roman youth to school, carrying a satchel with their books in it, sometimes also called librarius.

CAPSARIUS was also an attendant at the baths, to whom persons committed the keeping of their clothes.

CAPSARIUS (from *capsa*, "a chest,"), among the Roman bankers, was he who had the care of the money-chest or coffer.

CAPSICUM, or GUINEA-PEPPER: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 28th order, *Lurida*. The corolla is verticillated, and the fruit a sapless berry.

Caprioles
||
Caplicum.

Capſicum.

Species. 1. The annuum, with oblong fruit, is the common long-podded capſicum commonly cultivated in the gardens. Of this there is one kind with red, and another with yellow fruit: and of theſe there are ſeveral varieties, differing only in the ſize and figure of their fruit. 2. The tetragonum, commonly called *bell-pepper*. The fruit of this is red, and is the only kind proper for pickling, the ſkin being tender; whereas thoſe of the other ſorts are thin and tough. The pods are from an inch to an inch and half or two inches long; are very large, ſwelling, and wrinkled, flattened at the top, where they are angular, and ſometimes ſtand erect, at others grow downward. 3. The ceraſiforme, with a round ſmooth fruit, doth not grow ſo tall as the other ſorts, but ſpreads near the ground; the leaves come out in cluſters, are of a ſhining green, and ſtand on long footſtalks. The fruit is of a beautiful red, and of the ſize of a cherry. 4. The pyramidale, is a native of Egypt, and hath much narrower leaves than the other ſorts. The pods always grow erect, and are produced in great plenty, ſo that the plants make a good appearance for three months in the winter. 5. The minimum, commonly called *bird-pepper*, riſes with a ſhrubby ſtalk four or five feet high; the leaves are of a lucid green; the fruit grows at the diviſion of the branches, ſtanding erect: theſe are ſmall, oval, and of a bright red; they are much more ſharp and biting than thoſe of the other ſorts. Beſides theſe ſpecies, botaniſts deſcribe as many more; viz. the cordiforme, with heart-shaped fruit; the anguloſum, with angular heart-shaped fruit; the olivaforme, with oval fruit; the conoide, commonly called *ben-pepper*, with a conical red fruit growing erect; and the fruteſcens, with ſmall pyramidal fruit growing erect; commonly called *Barbary pepper*. Theſe, however, have no remarkable properties different from the others.

Culture. The three firſt ſpecies are annual plants, and muſt be propagated by ſeeds ſown on a hot-bed in the ſpring, and treated in the ſame manner with other exotics; they will however bear the open air, after being inured to it by degrees. The plants of the ſecond ſort, whoſe fruit is uſed for pickling, ſhould be taken from the hot-bed, and planted in a rich ſpot of ground in a warm ſituation about a foot and an half aſunder. They muſt be ſhaded till they have taken root, and afterwards duly watered in dry weather, which will greatly promote their growth and cauſe them to be more fruitful, and likewise enlarge the ſize of the fruit. By this management, three or four crops of fruit for pickling may be obtained the ſame year. The other ſorts are more tender; and therefore muſt be planted in pots plunged in a moderate hot-bed, and ſheltered under a frame.

Uſes, &c. The ſecond ſort, as already obſerved, produces fruit fit for pickling; for which purpoſe they muſt be gathered before they arrive at their full ſize, while their rind is tender. They muſt be ſlit down on one ſide to get out the ſeeds, after which they ſhould be ſoaked two or three days in ſalt and water; when they are taken out of this and drained, boiling vinegar muſt be poured on them in a ſufficient quantity to cover them, and cloſely ſtopped down for two months; then they ſhould be boiled in the vinegar to make them green; but they want no addition of any ſpice, and are the wholeſomeſt and beſt pickle in the world. The

tenth ſpecies is uſed for making what is called *cayan-butter*, or *pepper-pots*, by the inhabitants of America, and which they eſteem the beſt of all the ſpices. The following is a receipt for making of a pepper-pot: "Take of the ripe ſeeds of this ſort of capſicum, and dry them well in the ſun; then put them into an earthen or ſtone pot, mixing flour between every ſtratum of pods; and put them into an oven after the baking of bread, that they may be thoroughly dried: after which they muſt be well cleaned from the flour; and if any of the ſtalks remain adhering to the pods, they ſhould be taken off, and the pods reduced to a fine powder: to every ounce of this add a pound of wheat-flour, and as much leaven as is ſufficient for the quantity intended. After this has been properly mixed and wrought, it ſhould be made into ſmall cakes, and baked in the ſame manner as common cakes of the ſame ſize: then cut them into ſmall parts, and bake them again, that they may be as dry and hard as biſcuit; which being powdered and ſifted, is to be kept for uſe." This is prodigiouſly hot and acrimonious, ſetting the mouth as it were on fire. It is by ſome recommended as a medicine for flatulencies; but it is greatly to be doubted whether all thoſe hot irritating medicines are not productive of more harm than good, in this country at leaſt. If the ripe pods of capſicum are thrown into the fire, they will raiſe ſtrong and noiſome vapours, which occasion vehement ſneezing, coughing, and often vomiting, in thoſe who are near the place, or in the room where they are burnt. Some perſons have mixed the powder of the pods with ſnuff, to give to others for diverſion: but where it is in quantity, there may be danger in uſing it; for it will occasion ſuch violent fits of ſneezing, as may break the blood-veſſels of the head.

CAPSQUARES, ſtrong plates of iron which come over the trunnions of a gun, and keep it in the carriage. They are faſtened by a hinge to the prize-plate, that they may lift up and down, and form a part of an arch in the middle to receive a third part of the thickneſs of the trunnions: for two-thirds are let into the carriage, and the other end is faſtened by two iron wedges called the *fore-locks* and *keys*.

CAPSTAN, or **CAPSTERN**, a ſtrong maſſy column of timber, formed like a truncated cone, and having its upper extremity pierced with a number of holes to receive the bars or levers. It is let perpendicularly down through the decks of a ſhip; and is fixed in ſuch a manner, that the men, by turning it horizontally with their bars, may perform any work which requires an extraordinary effort.

A capſtern is compoſed of ſeveral parts, where *A* is ^{plate} the barrel, *b* the whelps, *c* the drum-head, and *d* the ^{CXXXVII.} ſpindle. The whelps riſe out from the main body of the capſtern like buttrefſes, to enlarge the ſweep, ſo that a greater quantity of cable, or whatever rope encircles the barrel, may be wound about it at one turn, without adding much to the weight of the capſtern. The whelps reach downwards from the lower part of the drum-head to the deck. The drum-head is a broad, cylindrical piece of wood reſembling a mill-ſtone, and fixed immediately above the barrel and whelps. On the outside of this piece are cut a number of ſquare holes parallel to the deck to receive the bars. The ſpindle or pivot *d*, which is ſhod with iron, is the axis

Capſicum

Capſtan.

Capstern or foot upon which the capstern rests, and turns round in the faucer, which is a sort of iron socket let into a wooden stock or standard called the *step*, resting upon and bolted to the beams.

Besides the different parts of the capstern above explained, it is furnished with several appurtenances, as the *bars*, the *pins*, the *pawls*, the *swifter*, and the *saucer*, already described. The bars are long pieces of wood or arms, thrust into a number of square holes in the drum-head all round, in which they are as the radii of a circle, or the spokes in the nave of a wheel. They are used to heave the capstern round, which is done by the men setting their breasts against them, and walking about, like the machinery of a horse-mill, till the operation is finished.—The pins *e*, are little bolts of iron thrust perpendicularly through the holes of the drum-head, and through a correspondent hole in the end of the bar, made to receive the pins when the bars are fixed. They are used to confine the bars, and to prevent them from working out as the men heave, or when the ship labours. Every pin is fastened to the drum-head with a small iron chain; and that the bars may exactly fit their respective holes, they are all numbered.—The pawls *f*, n° 1. are situated on each side the capstern, being two short bars of iron, bolted at one end through the deck to the beams close to the lower part of the whelps; the other end, which occasionally turns round on the deck, being placed in the intervals of the whelps, as the capstern turns round, prevents it from recoiling or turning back by any sudden jerk of the cable, as the ship rises on the sea, which might greatly endanger the men who heave. There are also hanging pawls *gg*, n° 3. used for the same purposes, reaching from the deck above to the drum-head immediately below it. The swifter is a rope passed horizontally through holes in the outer end of the bars, and drawn very tight; the intent of this is to keep the men steady as they walk round when the ship rocks, and to give room for a greater number to assist by pulling upon the swifter itself.

The most frequent use of the capstern is to heave in the cable, and thereby remove the ship or draw up the anchor. It is also used to wind up any weighty body, as the masts, artillery, &c. In merchant-ships it is likewise frequently employed to discharge or take in the cargo, particularly when consisting of weighty materials that require a great exertion of mechanical powers to be removed.

There are commonly two capsterns in a man of war, the *main* and the *gear* capstern; the former of which has two drum-heads, and may be called a *double one*. This is represented in n° 3. The latter is represented in n° 2.

Formerly the bars of the capstern went entirely thro' the head of it, and consequently were more than double the length of the present ones; the holes were therefore formed at different heights, as represented in n° 1. But this machine had several inconveniences, and has long been entirely disused in the navy. Some of these sort of capsterns, however, are still retained in merchant-ships, and are usually denominated *crabs*. The situation of the bars in a crab, as ready for heaving, is represented in n° 4.

To Rig the CAPSTERN, is to fix the bars in their respective holes, and thrust in the pins, in order to con-

fine them.—*Surge the CAPSTERN*, is the order to slacken the rope heaved round upon it, of which there are generally two turns and a half about the barrel at once, and sometimes three turns.—*To Heave the CAPSTERN*, is to go round with it heaving on the bars, and drawing in any rope of which the purchase is created.—*To Come-up the CAPSTERN*, is to let go the rope upon which they had been heaving.—*To Pawl the CAPSTERN*, is to fix the pawls to prevent it from recoiling during any pause of heaving.

CAPSULE, in a general sense, denotes a receptacle or cover in form of a bag.

CAPSULE, among botanists, a dry hollow seed-vessel or pericarpium, that cleaves or splits in some determinate manner. See **PERICARPIUM**.

This species of seed-vessel is frequently fleshy and succulent, like a berry, before it has attained maturity; but, in ripening, becomes dry, and often so elastic as to dart the seeds from their departments with considerable velocity. This elasticity is remarkably conspicuous in wood-sorrel; balsam, *impatiens*; African spiræa, *diosma*; *fraxinella*; *justicia*; *ruellia*; *barleria*; *lathræa*; and many others.—The general aptitude or disposition of this species of seed-vessel to cleave or separate for the purpose of dispersing its seeds, distinguishes it not less remarkably than its texture from the pulpy or succulent fruits of the apple, berry, and cherry kind. This opening of the capsule for discharging its seeds when the fruit is ripe, is either at the top, as in most plants; at the bottom, as in triglochin; at the side through a pore or small hole, as in campanula and orchis; horizontally, as in plantain, amaranthus, and anagallis; or longitudinally, as in convolvulus. All fruit that is jointed opens at every one of the joints, each of which contains a single seed. Capsules, in splitting, are divided, externally, into one or more pieces, called by Linnæus *valves*. The internal divisions of the capsules are called *cells*, *loculamenta*: these, in point of number, are exceedingly diversified; some having only one cell, as the primrose; and others many, as the water-lily. Hence a capsule is termed *unilocular*, *bilocular*, *trilocular*, &c. according as it has one, two, three, &c. cells or cavities.

CAPSULÆ Atrabiliarie, called also *glandula renales*, and *renes succenturiati*. See **ANATOMY**, n° 100.

CAPTAIN, a military officer, whereof there are several kinds, according to their commands.

CAPTAIN of a Troop or Company, an inferior officer who commands a troop of horse or a company of foot, under a colonel. The duty of this officer is to be careful to keep his company full of able-bodied soldiers; to visit their tents and lodgings, to see what is wanting; to pay them well; to cause them keep themselves neat and clean in their clothes, and their arms bright. He has power in his own company of making serjeants, corporals, and lanspésades.

In the horse and foot guards, the captains have the rank of colonels.

CAPTAIN-General, he who commands in chief.

CAPTAIN-Lieutenant, he who with the rank of captain, but the pay of lieutenant, commands a troop or company in the name and place of some other person who is dispensed with on account of his quality from performing the functions of his post.

Thus the colonel being usually captain of the first company

Capsule
||
Captain.

Captain. company of his regiment, that company is commanded by his deputy under the title of *captain-lieutenant*.

So in England, as well as in France, the king, queen, dauphin, princes, &c. have usually the title of captain of the guards, *gens d'armes*, &c. the real duty of which offices is performed by captain-lieutenants.

CAPTAIN Reformed, one who, upon the reduction of the forces, has his commission and company suppressed; yet is continued captain, either as second to another, or without any post or command at all.

CAPTAIN of a Ship of War, the officer who commands a ship of the line of battle, or a frigate carrying 20 or more cannon. The charge of a captain in his majesty's navy is very comprehensive, in as much as he is not only answerable for any bad conduct in the military government, navigation, and equipment of the ship he commands, but also for any neglect of duty or ill management in his inferior officers, whose several charges he is appointed to superintend and regulate.

On his first receiving information of the condition and quality of the ship he is appointed to command, he must attend her constantly, and hasten the necessary preparations to fit her for sea. So strict, indeed, are the injunctions laid on him by the lord high admiral, or commissioners of the admiralty, that he is forbid to lie out of his ship, from his arrival on board to the day of his discharge, unless by particular leave from the admiralty or from his commander in chief. He is enjoined to show a laudable example of honour and virtue to the officers and men; and to discountenance all dissolute, immoral, and disorderly practices, and such as are contrary to the rules of subordination and discipline; as well as to correct those who are guilty of such offences as are punishable according to the usage of the sea. He is ordered particularly to survey all the military stores which are sent on board, and to return whatever is deemed unfit for service. His diligence and application are required to procure his complement of men; observing carefully to enter only such as are fit for the necessary duty, that the government may not be put to unnecessary expence. When his ship is fully manned, he is expected to keep the established number of men complete, and superintend the muster himself if there is no clerk of the check at the port. When his ship is employed on a cruising station, he is expected to keep the sea the whole length of time previously appointed; but if he is compelled by some unexpected accident to return to port sooner than the time limited, he ought to be very cautious in the choice of a good situation for anchoring, ordering the master or other careful officers to sound and discover the depths of water and dangers of the coast. Previous to any possibility of an engagement with the enemy, he is to quarter the officers and men to the necessary stations according to their office and abilities, and to exercise them in the management of the artillery, that they may be more expert in time of battle. His station in the time of an engagement is on the quarter-deck: at which time he is expected to take all opportunities of annoying his enemy, and improving every advantage over him; to exhibit an example of courage and fortitude to his officers and crew; and to place his ship opposite to his adversary in such a position as that every cannon shall do effectual execution.

At the time of his arrival in port, after his return from abroad, he is to assemble his officers, and draw up a detail of the observations that have been made during the voyage, of the qualities of the ship as to her trim, ballast, stowage, manner of sailing, for the information and direction of those who may succeed him in the command: and this account is to be signed by himself and officers, and to be returned to the resident commissioner of the navy at the port where the ship is discharged.

CAPTAIN of a Merchant-ship, he who has the direction of the ship, her crew, and lading, &c. In small ships and short voyages, he is more ordinarily called the *master*. In the Mediterranean, he is called the *patroon*.—The proprietor of the vessel appoints the captain or master; and he is to form the crew, and choose and hire the pilots, mates, and seamen; though, when the proprietor and master reside on the same spot, they generally act in concert together.

CAPTAIN Bashaw, or *Capoudan Bashaw*, in the polity of the Turks, signifies the Turkish high admiral. He possesses the third office of the empire, and is invested with the same power at sea that the vizir has on shore. Soliman II. instituted this office in favour of the famous Barbarossa, with absolute authority over the officers of the marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without the Dardanelles. He commands in chief in all the maritime countries, cities, castles, &c. and, at Constantinople, is the first magistrate of police in the villages on the side of the Porte, and the canal of the Black-Sea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arsenal and with the army.—The captain-bashaw enjoys two sorts of revenues; the one fixed, the other casual. The first arise from a capitation of the islands in the Archipelago, and certain governments in Naxos and Galipoli. The latter consist in the pay of the men who die during a campaign; in a fifth of all prizes made by the begs; in the profits accruing from the labour of the slaves, whom he hires as rowers to the grand signior; and in the contributions he exacts in all places where he passes.

CAPTION, in Scots law, a writ issuing under his majesty's signet, in his majesty's name, obtained at the instance of a creditor in a civil debt, commanding messengers at arms and other officers of the law to apprehend and imprison the person of the debtor until he pay the debt.—It is also the name of a writ issued by the court of Session against the agents of the court, to return papers belonging to processes or law-suits, or otherwise to go to prison.

CAPTIVE, a slave, or a person taken from the enemy.

Formerly captives in war became the slaves of those who took them; and though slavery, such as obtained among the ancients, is now abolished, some shadow of it still remains in respect of prisoners of war, who are accounted the property of their captors, and have no right to liberty but by concession from them.—The Romans used their captives with great severity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction. Captives were frequently burnt in the funeral piles of the ancient warriors, as a sacrifice to the infernal

fernal gods. Those of royal or noble blood had their heads shaven, and their hair sent to Rome to serve as decorations for female toys, &c. They were led in triumph loaded with chains through Rome, in the emperor's train, at least as far as the foot of the Capitoline mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of the prime quality were honoured with golden chains on their hands and feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being carried in triumph, their images or effigies were frequently carried in their place.

CAPTIVITY, in a general sense, the state or condition of a captive.

CAPTIVITY, in sacred history, a punishment which God inflicted upon his people for their vices and infidelities. The first of these captivities is that of Egypt, from which Moses delivered them; after which, are reckoned six during the government of the judges; but the greatest and most remarkable were those of Judah and Israel, which happened under the kings of each of these kingdoms. It is generally believed, that the ten tribes of Israel never came back again after their dispersion; and Josephus and St Jerom are of this opinion: nevertheless, when we examine the writings of the prophets, we find the return of Israel from captivity pointed out in a manner almost as clear as that of the tribes of Benjamin and Judah: See Hosea i. 10, 11. Amos ix. 14. The captivities of Judah are generally reckoned four; the fourth and last of which fell in the year of the world 3416, under Zedekiah: and from this period begins the 70 years captivity foretold by Jeremiah.

Since the destruction of the temple by the Romans, the Hebrews boast that they have always had their heads or particular princes, whom they call *princes of the captivity*, in the east and west. The princes of the captivity in the east governed the Jews that dwelt in Babylon, Assyria, and Persia; and the princes of the captivity in the west governed those who dwelt in Judæa, Egypt, Italy, and in other parts of the Roman empire. He who resided in Judæa commonly took up his abode at Tiberias, and assumed the name of *Rofchabboth*, "head of the fathers or patriarchs." He presided in assemblies, decided in cases of conscience, levied taxes for the expences of his visits, and had officers under him who were dispatched through the provinces for the execution of his orders. As to the princes of the captivity at Babylon, or the east, we know neither the original nor succession of them. It only appears that they were not in being before the end of the second century.

CAPTURE, a prize, or prey; particularly that of a ship taken at sea. Captures made at sea were formerly held to be the property of the captors after a possession of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods must have been brought into port, and have continued a night *intra presidia*, in a place of safe custody, so that all hope of recovering them was lost.

CAPTURE also denotes an arrest or seizure of a criminal, debtor, &c. at land.

CAPUA, (anc. geog.) a very ancient city of Italy,

in Campania, and capital of that district. It is famous for the abode of Hannibal the Carthaginian general after the battle of Cannæ, and where Livy accuses him, but unjustly, of having enervated himself with pleasures*. It still retains the name, and is the see of an archbishop. It is seated on the river Vulturino, in E. Long. 15. 5. N. Lat. 41. 7. The history of Capua is thus shortly deduced by Mr Swinburne. "It was a settlement of the Osci known before the foundation of Rome; as the amazing fertility of the land and a lucrative commerce poured immense wealth upon its inhabitants, it became one of the most extensive and magnificent cities in the world. With riches excessive luxury crept in, and the Capuans grew insolent; but by their effeminacy they soon lost the power of repelling those neighbouring nations which their insolence had exasperated: For this reason Capua was continually exposed to the necessity of calling in foreign aid, and endangering its safety by the uncommon temptations it offered to needy auxiliaries. The Roman soldiers sent to defend Capua were on the point of making it their prey, and often the voice of the Roman people was loud for a removal from the barren unwholesome banks of the Tiber to the garden of Italy, near those of the Volturno. Through well-founded jealousy of the ambition of Rome, or, as Livy and other partial writers term it, natural inconstancy, the Capuans warmly espoused the quarrel of Carthage: Hannibal made Capua his winter-quarters after the campaign of Cannæ; and there, if we are to believe historians, his rough and hitherto invincible soldiers were enervated by pleasure and indolence.

"When through a failure of supplies from Carthage Hannibal was under a necessity of remaining in Bruttium, and leaving the Capuans to defend themselves, this city, which had been long invested, was surrendered at discretion to the consuls Appius Claudius and Q. Fulvius Flaccus. The senators were put to death, the nobles imprisoned for life, and all the citizens sold and dispersed. Vibius, the chief of Hannibal's friends, avoided this ignominious fate, and escaped from the cruel vengeance of the Romans by a voluntary death.—When the mob insisted upon the gates being thrown open to the enemy, Vibius assembled his steady associates, and sat down with them to a superb banquet, after which each of the guests swallowed a poisonous draught, and expired in full possession of their freedom. The buildings were spared by the victor; and Capua was left to be merely a harbour for the husbandmen of the plain, a warehouse for goods, and a granary for corn; but so advantageous a situation could not long be neglected; colonies were sent to inhabit it, and in process of time it regained a degree of importance.

"Genseric the Vandal was more cruel than the Roman conquerors had been; for he massacred the inhabitants, and burnt the town to the ground. Narfes rebuilt it; but in 841 it was totally destroyed by an army of Saracens, and the inhabitants driven into the mountains. Some time after the retreat of these savage invaders, the Lombards ventured down again into the plain, but not deeming their force adequate to the defence of so large a circuit as the old city, they built themselves a smaller one on the river, and called it Capua.—They chose the site of Casilinum, famous in the second Pu-

Capua.

See Carthage.

Capuchins

nic war for the resistance made by its garrison against Hannibal. Since the foundation of the new city, old Capua has remained in ruins.

"In 856 Landolph formed here an independent earldom dismembered from the duchy of Benevento, and in the course of a few generations Capua acquired the title of a principality. In the 11th century, the Normans of Averfa expelled the Lombard race of princes, and Richard their chief became prince of Capua; the grandson of Tancred of Hauteville drove out the descendants of Richard, and united this state to the rest of his possessions.

"Capua is at present a neat little city, fortified according to the rules of modern art, and may be considered as the key of the kingdom; though far removed from the frontier, it is the only fortification that really covers the approach to Naples."

CAPUCHINS, religious of the order of St Francis in its strictest observance; deriving their name from *capuce*, or *capuchon*, a stuff cap, or cowl, wherewith they cover their heads. They are clothed with brown or grey; always bare-footed; are never to go in a coach, nor ever shave their beard.—The capuchins are a reform made from the order of minors, commonly called *cordeliers*, set on foot in the 16th century by Matthew Baschi, a religious observant of the monastery of Montefiascone; who, being at Rome, was advertised several times from heaven, to practise the rule of St Francis to the letter. Upon this he made application to pope Clement in 1525; who gave him permission to retire into a solitude, with as many others as chose to embrace the strict observance. In 1528, they obtained the pope's bull. In 1529, the order was brought into complete form; Matthew was elected general, and the chapter made constitutions. In 1543, the right of preaching was taken from the capuchins by the pope: but in 1545 it was restored to them again with honour. In 1578, there were already 17 general chapters in the order of capuchins.

CAPUT, the head. See HEAD.

CAPUT baroniae, the head of the barony, in ancient customs, denotes the ancient or chief seat or castle of a nobleman, where he made his usual residence, and held his court; sometimes also called *caput honoris*, or the head of the honour. The *caput baroniae* could not be settled in dowry; nor could it be divided among the daughters, in case there were no son to inherit; but was to descend entire to the eldest daughter, *ceteris filiabus aliunde satisfactis*.

CAPUT gallinaginis, in anatomy, is a kind of septum, or spongy border, at the extremities or apertures of each of the *vesiculae seminales*; serving to prevent the seed coming from one side, from rushing upon, and so stopping, the discharge of the other.

CAPUT lupinum. Anciently an outlawed felon was said to have *caput lupinum*, and might be knocked on the head like a wolf, by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him: yet now, to avoid such inhumanity, it is holden that no man is intitled to kill him wantonly and wilfully; but in so doing he is guilty of murder, unless it is done in the endeavour to apprehend him.

CAPUT Mortuum, a Latin name given to fixed and exhausted residuums remaining in retorts after distillations. As these residuums are very different, according to the substances distilled, and the degree of heat employed, they are by the more accurate modern chemists particularly specified by adding a term denoting their qualities; as *earthy residuum*, *charry residuum*, *saline residuum*, &c.

CARABINE, a fire-arm shorter than a musket, carrying a ball of 24 in the pound, borne by the light horse, hanging at a belt over the left shoulder. The barrel is two feet and an half long; and is sometimes furrowed spirally within, which is said to add to the range of the piece.

CARABINEERS, regiments of light horse, carrying longer carabines than the rest, and sometimes used on foot.

CARABUS, in zoology, a genus of insects belonging to the order of coleoptera, or the beetle kind. The feelers are bristly; the breast is shaped like a heart, and marginated; and the elytra are likewise marginated. There are 34 species of this genus, mostly distinguished by their colour. The most remarkable is the crepitans, or bombardier, with the breast, head, and legs, ferruginous or iron-coloured, and the elytra black. It keeps itself concealed among stones, and seems to make little use of its wings: when it moves, it is by a sort of jump; and whenever it is touched, one is surprised to hear a noise resembling the discharge of a musket, in miniature, during which a blue smoke may be perceived to proceed from its anus. The insect may be made at any time to play off its artillery, by scratching its back with a needle. If we may believe Rolander, who first made these observations, it can give 20 discharges successively. A bladder placed near the anus is the arsenal whence it derives its store, and this is its chief defence against an enemy, although the smoke emitted seems to be altogether inoffensive, except it be by causing a fright, or concealing its course. Its chief enemy is another species of the same genus, but four times larger: when pursued and fatigued, the bombardier has recourse to this stratagem, by lying down in the path of the large carabus, which advances with open mouth and claws to seize it; but, on this discharge of the artillery, suddenly draws back, and remains a while confused: during which the bombardier conceals himself in some neighbouring crevice; and if not happy enough to find one, the large carabus returns to the attack, takes the insect by the head, and tears it off.

CARACALLA (M. Antoninus Bassianus), emperor after his father Severus in 211, put the physicians to death for not dispatching his father as he would have had them. He killed his brother Geta; and put Papinianus to death, because he would not defend nor excuse his parricide. In short, it is said that 20,000 persons were massacred by his order. He married Julia, his father's widow. Going to Alexandria, he slew the inhabitants, and applied to the magicians and astrologers. At last, going from Edessa to Mesopotamia, one of his captains slew him, by order of Macrinus, who succeeded him. He died after he had reigned somewhat more than six years.

CARACALLA, in antiquity, a long garment, having a sort of capuchin, or hood a-top, and reaching to the heels; worn equally among the Romans by the men and

CXV.

Caraccas,
Caracci.

Caracci.

and the women, in the city and the camp. Spartian and Xiphilian represent the emperor Caracalla as the inventor of this garment, and hence suppose the appellation *Caracalla* was first given him. Others, with more probability, make the caracalla originally a Gallic habit, and only brought to Rome by the emperor above mentioned, who first enjoined the soldiery to wear it. The people called it *antoninian*, from the same prince, who had borrowed the name of Antoninus. The caracalla was a sort of cassock, or furtout. Salmasius, Scaliger, and after them Du-Cange, even take the name *casaque* to have been formed from that of *caraque*, for *caracalla*. This is certain from St Jerom, that the caracalla, with a retrenchment of the capuchin, became an ecclesiastical garment. It is described as made of several pieces cut and sewed together, and hanging down to the feet; but it is more than probable there were some made shorter, especially out of Rome, otherwise we do not see how it could have fitted the soldiers purposes.

CARACCAS, a district of Terra Firma in South America, belonging to the Spaniards. The coast is rocky and mountainous, interspersed with small fertile valleys; subjected at certain seasons of the year to dry north-west winds, but blessed in general with a clear air and wholesome climate. A very great illicit trade is carried on by the English and Dutch with this province, notwithstanding all the vigilance of the Spaniards, who have scouts perpetually employed, and breast-works raised in all the valleys. A vast number of cacao-trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fe consumes 20,000; Mexico a little more; the Canaries a small cargo; and Europe from 50 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called *Nirva*, into which they will not admit any white people. The chief town is likewise called *Caraccas*, and is situated in N. Lat. 10. 10. Dampier says it stands at a considerable distance from the sea; is large, wealthy, and populous; and extremely difficult of access, by reason of the steep and craggy hills over which an enemy must take his route. The commerce of this town, to which the bay of Guaira at two leagues distance serves for a harbour, was for a long time open to all the subjects of the Spanish monarchy, and is still so to the Americans; but the Europeans are not so well treated. In 1728 a company was formed at St Sebastian, which obtained an exclusive right of maintaining connections with this part of the new world. Four or five ships, which they dispatch every year, sail from thence, but they return to Cadiz.

CARACCI, (Lewis, Augustin, and Hannibal), three celebrated painters of the Lombard school, all of Bologna. Lewis was born in 1555; and was cousin-german to Augustin and Hannibal who were brothers, the sons of a taylor, who was yet careful to give them a liberal education. They were both disciples of their cousin Lewis. Augustin gained a knowledge of mathematics, natural philosophy, music, poetry, and most of the liberal arts; but, though painting was his principal pursuit, he learned the art of engraving from Cornelius Cort, and surpassed all the masters of his

time. Hannibal, again, never deviated from his pencil. —These three painters, at length, having reaped all the advantages they could by contemplation and practice, formed a plan of association, continued always together, and laid the foundation of that celebrated school which has ever since been known by the name of *Caracci's academy*. Hither all the young students, who had a view of becoming masters, resorted to be instructed in the rudiments of painting; and here the Caracci taught freely, and without reserve, all that came. Lewis's charge was to make a collection of antique statues and bas-reliefs. They had designs of the best masters, and a collection of curious books on all subjects relating to their art; and they had a skilful anatomist always ready to teach what belonged to the knitting and motions of the muscles, &c. There were often disputations in the academy; and not only painters, but men of learned professions, proposed questions, which were always decided by Lewis. Every body was well received; and though stated hours were allotted to treat of different matters, yet improvements might be made at all hours by the antiquities and the designs which were to be seen.

The fame of the Caracci reaching Rome, the cardinal Farnese sent for Hannibal thither, to paint the gallery of his palace. Hannibal was the more willing to go, because he had a great desire to see Raphael's works, with the antique statues and bas-reliefs. The gusto which he took there from the ancient sculpture, made him change his Bolognian manner for one more learned but less natural in the design and in the colouring. Augustin followed Hannibal, to assist him in his undertaking of the Farnese gallery; but the brothers not rightly agreeing, Farnese sent Augustin to the court of the duke of Parma, where he died in the year 1602, being only 45 years of age. His most celebrated piece of painting is that of the communion of St Jerom, in Bologna.

In the mean while, Hannibal continued working in the Farnese gallery at Rome; and, after inconceivable pains and care, finished the paintings in the perfection in which they are now to be seen. He hoped that the cardinal would have rewarded him in some proportion to the excellence of his work, and the time it took him up, which was eight years; but he was disappointed. The cardinal, influenced by an ignorant Spaniard his domestic, gave him but a little above 200l. though it is certain he deserved more than twice as many thousands. When the money was brought him, he was so surprised at the injustice done him, that he could not speak a word to the person who brought it. This confirmed him in a melancholy to which his temper naturally inclined, and made him resolve never more to touch his pencil; which resolution he had undoubtedly kept, if his necessities had not compelled him to break it. It is said that his melancholy gained so much upon him, that at certain times it deprived him of the use of his senses. It did not, however, put a stop to his amours; and his debauches at Naples, whither he had retired for the recovery of his health, brought a distemper upon him of which he died in 1609, when he was 49 years of age. His veneration for Raphael was so great, that it was his deathbed request to be buried in the same tomb with him; which was accordingly done, in the pantheon or rotunda at Rome. There are extant several

Caracol
||
Caract.

veral prints of the blessed Virgin, and some other subjects etched by the hand of this incomparable artist. He is said to have been a friendly, plain, honest, and open-hearted man; very communicative to his scholars; and so extremely kind to them, that he generally kept his money in the same box with his colours, where they might have recourse to either as they had occasion.

While Hannibal Caracci worked at Rome, Lewis was courted from all parts of Lombardy, especially by the clergy, to make pictures in their churches; and we may judge of his capacity and facility, by the great number of pictures he made, and by the preference that was given him to other painters. In the midst of these employments Hannibal solicited him to come and assist him in the Farnese gallery; and so earnestly, that he could not avoid complying with his request. He went to Rome; corrected several things in that gallery; painted a figure or two himself; and then returned to Bologna, where he died in 1619, aged 64.

CARACOL, in the manege, the half turn which an horseman makes, either to the right or left—In the army, the horse always makes a caracol after each discharge, in order to pass the rear of the squadron.

CARACOL, in architecture, denotes a stair-case in a helix or spiral form.

CARACOLI, a kind of metal of which the Caribbees, or natives of the Lesser Antilles, make a sort of ornament in the form of a crescent, which they also call *caracoli*.—This metal comes from the main land; and the common opinion is, that it is a compound of silver, copper, and gold, something like the Corinthian brass among the ancients. These metals are so perfectly mixed and incorporated together, that the compound which results from them, it is said, has a colour that never alters, how long soever it remains in the sea or under ground. It is somewhat brittle; and they who work at it are obliged to mix a large proportion of gold with it, to make the compound more tough and malleable.

CARACT, or CARAT, the name of that weight which expresses the degree of fineness that gold is of. The word is also written, *carraat*, *carrat*, *karrat*, and *karrat*. Its origin is contested: But the most probable opinion is that of Kennet, who derives it from *carreda*, a term which anciently denoted any weight, and came not till of later days to be appropriated to that which expresses the fineness of gold and the gravity of diamonds.

These carats are not real determinate weights, but only imaginary. The whole mass, be the weight what it will, is conceived to be divided into 24 carats; and as many 24th parts as it contains of pure gold, it is called *gold of so many carats*, or *so many carats fine*. Thus, gold of 18 carats is a mixt, of which 18 parts is pure gold, and the other six an inferior metal, &c. This is the common way of reckoning in Europe, and at the gold mines in the Spanish West Indies, but with some variation in the subdivision of the carat: among us, it is divided into four grains; among the Germans, into 12 parts; and by the French, according to Mr Helot, into 32. The Chinese reckon by a different division called *touches*, of which the highest number, or that which denotes pure gold, is 100; so that 100 touches correspond to our 24 carats, &c.

CARACT is also a certain weight which goldsmiths and jewellers use wherewith to weigh precious stones and pearls.—In this sense, the word is by some supposed to be derived from the Greek *κερατιον*, a fruit which the Latins call *siliqua*, and we *carob bean*; each of which may weigh about four grains of wheat, whence the Latin *siliqua* has been used for a weight of four grains. This caract weighs four grains, but they are something lighter than the grains of other weights. Each of these grains is subdivided in $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{16}$, &c.

CARACTACUS, a renowned king of the ancient British people called *Silures*, inhabiting South Wales. Having valiantly defended his country seven years against the Romans, he was at length defeated; and flying to Cartimunda, queen of the Brigantes (inhabitants of Yorkshire), was by her treacherously delivered up to the Romans, and led in triumph to the emperor Claudius then at York; where his noble behaviour, and heroic but pathetic speech, obtained him not only his liberty, but the esteem of the emperor, A. D. 52.

CARAGROUTH, in commerce, a silver coin of the empire, weighing nine drachms. It goes at Constantinople for 120 aspers. There are four sorts of them, which are all equally current and of the same value.

CARAITES, in the ecclesiastical history of the Jews, a religious sect among that people, whereof there are still some subsisting in Poland, Russia, Constantinople, Cairo, and other places of the Levant; whose distinguishing tenet and practice it is, to adhere closely to the words and letter of the scripture, exclusive of allegories, traditions, and the like.

Leo of Modena, a rabbin of Venice, observes, that of all the heresies among that people, before the destruction of the temple, there is none now left but that of the *Caraim*, a name derived from *Micra*, which signifies the pure text of the bible; because of their keeping to the Pentateuch, observing it to the letter, and rejecting all interpretations, paraphrases, and constitutions of the rabbins. Aben Ezra, and some other rabbins, treat the Caraites as Sadducees; but Leo de Juda calls them, more accurately, Sadducees reformed; because they believe the immortality of the soul, paradise, hell, resurrection, &c. which the ancient Sadducees denied. He adds, however, that they were doubtless originally real Sadducees, and sprung from among them.

M. Simon, with more probability, supposes them to have risen hence; that the more knowing among the Jews opposing the dreams and reveries of the rabbins, and using the pure texts of scripture to refute their groundless traditions, had the name of *Caraim* given them; which signifies as much as the barbarous Latin, *Scripturarii*; i. e. people attached to the text of scripture. The other Jews give them the odious name Sadducees, from their agreement with those sectaries on the head of traditions. Scaliger, Vossius, and Spanheim, rank the Caraites among the Sabeans, Magi, Manichees, and Mussulmans, but by mistake: Wolfgang, Fabricius, &c. say the Sadducees and Esseni were called Caraites, in opposition to the Pharisees: others take them for the doctors of the law so often mentioned in the gospel: but these are all conjectures. Josephus and Philo make no mention of them; which shows

Caraites. shows them to be more modern than either of those authors. In all probability, this sect was not formed till after the collection of the second part of the Talmud, or the Gemara; perhaps not till after the compiling of the Mishna in the third century. The Caraites themselves pretend to be the remains of the ten tribes led captive by Shalmaneser. Wolfius, from the Memoirs of Mardacheus, a Caraites, refers their origin to a massacre among the Jewish doctors, under Alexander Jannæus, their king, about 100 years before Christ: because Simeon, son of Schetach, and the queen's brother, making his escape into Egypt, there forged his pretended traditions; and, at his return to Jerusalem, published his visions; interpolating the law after his own fancy, and supporting his novelties on the notices which God, he said, had communicated by the mouth of Moses, whose depositary he was: he gained many followers; and was opposed by others, who maintained, that all which God had revealed to Moses was written. Hence the Jews became divided into two sects, the Caraites and Traditionaries: among the first, Juda, son of Tabbai, distinguished himself; among the latter, Hillel. Wolfius reckons not only the Sadducees, but also the Scribes, in the number of Caraites. But the address of the Pharisees prevailed against them all; and the number of Caraites decreased: Anan, indeed, in the eighth century, retrieved their credit a little; and rabbi Schalomon in the ninth. They succeeded pretty well till the fourteenth; but since that time they have been declining.

The Caraites are but little known; their works coming only into very few hands, even among the greatest Hebraists. Buxtorf never saw more than one; Selden two; but Mr Trigland says, he has recovered enough to speak of them with assurance. He asserts, that soon after the prophets had ceased, the Jews became divided on the subject of works, and supererogation: some maintaining their necessity from tradition; whilst others keeping close to the written law, set them aside; and it was from these last that Caraitism commenced. He adds, that after the return from the Babylonish captivity, the observation of the law being to be re-established, there were several practices found proper for that end; and these once introduced, were looked upon as essential, and appointed by Moses; which was the origin of Pharisaism; as a contrary party, continuing to keep close to the letter, founded Caraitism.

The modern Caraites, Leo of Modena observes, have their synagogues and ceremonies; they pretend to be the sole proper Jews, or observers of the laws of Moses; calling the rest by the term *Rabbanim*, or *followers of the Rabbins*: these hate the Caraites mortally; refusing to ally or even converse with them, and treating them as *mamzerim*, or bastards; because of their rejecting the constitutions of the rabbins relating to marriages, repudiations, purifications of women, &c. This aversion is so great, that if a Caraites would become a rabbinist, he would never be received by the other Jews.

The Caraites, however, do not absolutely reject all kind of traditions; but only such as do not appear well-grounded. Selden, who is very express on this point, in his *Uxor Hebraica*, observes, that besides the mere text, they have certain interpretations, which they call hereditary, and which are proper traditions.

Their theology only seems to differ from that of the other Jews, in that it is purer, and clearer of superstition: they give no credit to the explications of the Cabbalists, chimerical allegories, nor to any constitutions of the Talmud, but what are conformable to the scripture, and may be drawn from it by just and necessary consequences.

Peringer observes of the Caraites in Lithuania, that they are very different, both in aspect, language, and manners, from the rabbinites, wherewith that country abounds. Their mother-tongue is the Turkish; and this they use in their schools and synagogues. In visage they resemble the Mahometan Tartars. Their synagogues are placed north and south; and the reason they give for it is, that Shalmaneser brought them northward: so that in praying, to look to Jerusalem, they must turn to the south. He adds, that they admit all the books of the Old Testament; contrary to the opinion of many of the learned, who hold that they reject all but the Pentateuch.

Caleb, a Caraites, reduces the difference between them and the rabbinites to three points: 1. In that they deny the oral law to come from Moses, and reject the Cabbala. 2. In that they abhor the Talmud. 3. In that they observe the feasts, as the sabbaths, &c. much more rigorously than the rabbins do. To this may be added, that they extend the degrees of affinity, wherein marriage is prohibited, almost to infinity.

CARAMANIA, a considerable province of Turkey, in Asia, in the south part of Natolia. Bajazet united this province to his empire about the year 1488, and since that time it has continued in the possession of the Turks. Satalia was the capital city, but is now much decayed.

CARAMANTA, a town of South America, and capital of a province of the same name in Terra Firma, and in the audience of Santa Fe. W. Long. 72. 35. N. Lat. 5. 18. The province of Caramanta is extended on both sides the river Cauca; and is bounded on the north by the district of Carthagena, on the east by New Grenada, on the south by Popayan, and on the west by Popayan and by the audience of Panama. It is a valley surrounded on every side by very high mountains.

CARANGA, an inconsiderable island near Bombay in the East Indies. It affords nothing but some rice, fowls, and goats, for that market.

CARANNA, or KARANNA, a very scarce gum which comes from New Spain. It is said to possess many extraordinary medical virtues, but the present practice takes no notice of it.

CARANUS, the first king of Macedon, and the seventh of the race of the Heraclides. See MACEDONIA.

CARARA, a weight at Leghorn, and in other parts of Italy, used in the sale of wool and cod-fish, equivalent to 60 pounds of that country.

CARAT. See CARACT.

CARAVAGGIO. (Michael Angelo da). See ANGELO.

CARAVAN, or KARAVANNE, in the east, signifies a company or assembly of travellers and pilgrims, and more particularly of merchants, who, for their greater security, and in order to assist each other, march in a body through the deserts, and other dangerous places, which are infested with Arabs or robbers.

There

Caramania
||
Caravan.

Caravan,
Caravan-
fera.

There are four regular caravans which go yearly to Mecca; the first from Damascus, composed of the pilgrims from Europe and Asia; the second from Cairo, for the Mahometans of Barbary; the third from Zibith, a place near the mouth of the Red Sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Most of the inland commerce of the East is carried on by caravans. The late czar Peter the Great established a trade between Russia and China by means of a caravan. M. Bougnon, geographer to the duke of Lorraine, has given a treatise of the caravans of merchants in Asia; wherein he shows of what they are composed, how many forts there are, the several uses of the different sorts of animals in them; the prices given for them, the officers and men appointed to conduct them, and the pay of each, with their manner of marching, halting, fighting, retreating, &c. Caravans of this kind are large convoys of armed men, merchants, and travellers, with divers sorts of animals for the carriage of their provisions. There are commonly four chief officers of a caravan, viz. the caravan bachi, or chief; the captain-guide; captain of rest; and captain of distribution. The first has absolute command over all the rest: the second is absolute in the march: the office of the third only commences when the caravan stops and makes a stay: to the fourth it belongs to dispose of every part of the corps, in case of an attack or battle; he has also the inspection over the distribution of provisions, which is made under him by several distributors, who give security to the master of the caravan, and have each of them a certain number of persons, elephants, dromedaries, &c. to take care of at their own peril. The treasurer of the caravan makes a fifth officer, who has under him several agents and interpreters, who keep journals of all that passes, for the satisfaction of those concerned in fitting out the caravan.

Any dealer is at liberty to form a company, in order to make a caravan. He in whose name it is raised, is considered as the caravan bachi, or chief of the caravan, unless he appoint some other in his place. If there are several merchants equally concerned, they elect a caravan bachi; after which, they appoint officers to conduct the caravan and decide all controversies that may arise during the journey.

There are also sea caravans; established on the same footing, and for the same purposes: such is the caravan of vessels from Constantinople to Alexandria.

CARAVANSERA, or KARAVANSERA, a place appointed for receiving and loading the caravans.

It is commonly a large square building, in the middle of which there is a very spacious court; and under the arches or piazzas that surround it there runs a bank, raised some feet above the ground, where the merchants, and those who travel with them in any capacity, take up their lodgings as well as they can; the beasts of burden being tied to the foot of the bank. Over the gates that lead into the court, there are sometimes little rooms, which the keepers of the caravanferas let out at a very high price to such as have a mind to be private.

The caravanferas in the East are something of the nature of the inns in Europe; only that you meet with little accommodation either for man or beast, but

N^o 64.

are obliged to carry almost every thing with you: there is never a caravanfera without a well, or spring of water. These buildings are chiefly owing to the charity of the Mahometans; they are esteemed sacred dwellings, where it is not permitted to insult any person, or to pillage any of the effects that are deposited there. There are also caravanferas where most things may be had for money; and as the profits of these are considerable, the magistrates of the cities to whose jurisdiction they belong, take care to store them well. There is an inspector, who, at the departure of each caravan, fixes the price of the night's lodging, from which there is no appeal.

CARAVANSERASKIER, the steward or keeper of a CARAVANSERA. He keeps an account of all the merchandises that are sold upon trust, and demands the payments of the sums due to the merchants for what has been sold in the caravanfera, on the seller's paying two per cent.

CARAVEL; thus they call a small vessel on the coast of France, which goes to fish for herring on the banks. They are commonly from 25 to 30 tons burden. Those which are designed for the same fishery in the British channel are called by the French *trin-quarts*: these are from 12 to 15 tons burden.

CARAWAY, in botany. See CARUM.

CARBONADE, or CARBONADO, in cookery; flesh, fowl, or the like, seasoned and broiled on the coals.

CARBUNCLE, in natural history, a very elegant gem, whose colour is deep red, with an admixture of scarlet.

This gem was known among the ancients by the name of *anthrax*. It is usually found pure and faultless, and is of the same degree of hardness with the sapphire: it is naturally of an angular figure; and is found adhering, by its base, to a heavy and ferruginous stone of the emery kind: its usual size is near a quarter of an inch in length, and two thirds of that in diameter in its thickest parts: when held up against the sun, it loses its deep tinge, and becomes exactly of the colour of a burning charcoal, whence the propriety of the name which the ancients gave it. It bears the fire unaltered, not parting with its colour, nor becoming at all the paler by it. It is found only in the East Indies, so far as is yet known; and there but very rarely.

CARBUNCLE, or *Anthrax*, in medicine, an inflammation which arises, in time of the plague, with a vesicle or blister almost like that produced by burning.

CARBUNCLE, in heraldry, a charge or bearing, consisting of eight radii, four whereof make a common cross, and the other four a saltier.

Some call these radii *buttons*, or *staves*, because round, and enriched with buttons, or pearly like pilgrim's staves, and frequently tipped or terminated with flower-de-luces; others blazon them, royal sceptres, placed in saltier, pale and fesse.

CARCASSE, or CARCUS, in the art of war, an iron case, or hollow capacity, about the bigness of a bomb, of an oval figure, made of ribs of iron, filled with combustible matters, as meal-powder, saltpetre, sulphur, broken glass, shavings of horn, turpentine, tallow, &c. It has two or three apertures out of which the fire is to blaze; and the design of it is to be thrown

2

out

Caravanse-
raskier
||
Carcasse.

Carcas-
sonne
||
Carceres.

out of a mortar, to set houses on fire, and do other execution. It has the name *carcasse*, because the circles which pass from one ring or plate to the other seem to represent the ribs of a human carcase.

CARCASSONNE, an ancient city of France, in Lower Languedoc, with a bishop's see. It is divided into the upper and lower town. They are both surrounded with walls; and though their situations are different, they are both watered by the river Aude. The upper town is seated on a hill, with a castle that commands it, as well as the lower town. It is strong, not only by its situation on a craggy rock, but also by several large towers which are joined to its walls, and which render it of difficult access. The cathedral church is remarkable for nothing but its antiquity. The lower town is large, and built after the modern taste. The streets are very straight, and lead to a large square in the middle, from whence may be seen the four gates of the town. There is here a manufacture of cloth. The neighbouring country is full of olive-trees; and in the mountains there is a fine marble, commonly called *marble of Languedoc*. E. Long. 2. 25. N. Lat. 43. 11.

This place bore a considerable share in that celebrated crusade undertaken against the Albigenes in the beginning of the 13th century, and which forms one of the most astonishing instances of superstition and of atrocious barbarity to be found in the annals of the world. When the royal power was nearly annihilated, during the reigns of the last kings of the Carolingian race in France, most of the cities of Languedoc erected themselves into little independent states, governed by their own princes. Carcassonne was then under the dominion of viscounts. At the time when Pope Innocent III. patronized and commanded the prosecution of hostilities against the Albigenes for the crime of heresy, Raymond the reigning viscount was included in that proscription. Simon de Montfort, general of the army of the church, invested the city of Carcassonne in 1209. The inhabitants, terrified at the fate of several other places where the most dreadful massacres had been committed, demanded leave to capitulate; but this act of mercy was only extended to them under a condition equally cruel, incredible, and unparalleled in history, if we were not compelled to believe it by the unanimous testimony of all the cotemporary writers. The people found in the place were all obliged, without distinction of rank or sex, to evacuate it in a state of nudity; and Agnes the viscountess was not exempted, though young and beautiful, from this ignominious and shocking punishment. "On les fit sortir tout nus de la ville de Carcassonne (says an ancient author) afin qu'ils receussent de la honte, en montrant ces parties du corps que la pureté de la langue n'exprime point, desquelles ils avoient abusé, et s'en étoient servis dans des crimes execrables." It seems by this imputation that the Albigeois were accused by their enemies of some enormities, probably unjust, and similar to those which religious enmity and prejudice have attributed to the followers of Zinzendorf in the present century.

CARCERES, in the ancient Circensian games, were inclosures in the circus, wherein the horses were restrained till the signal was given for starting, when, by an admirable contrivance, they all at once flew open.

VOL. IV. Part I.

CARCHEMISH (anc. geog.), a town lying upon the Euphrates, and belonging to the Assyrians. Necho king of Egypt took it from the king of Assyria, 2 Chr. xxxv. 20. Necho left a garrison in it, which was taken and cut to pieces, in the fourth year of Jehoiachan king of Judah, by Nebuchadnezzar king of Babylon, 2 Kings xxiii. 29. Isaiah (x. 9.) speaks of Carchemish, and seems to say, that Tiglath-pileser made a conquest of it, perhaps from the Egyptians. This is thought to be the same city with that called Circesium by the Greeks and Latins.

CARCINOMA, in medicine; the same with CANCER.

CARD, among artificers, an instrument consisting of a block of wood, beset with sharp teeth, serving to arrange the hairs of wool, flax, hemp, and the like: there are different kinds of them, as hand-cards, flock-cards, &c. They are made as follows:

A piece of thick leather, of the size intended for the card, is strained in a frame for that purpose; and then pricked full of holes, into which the teeth or pieces of iron wire are inserted. After which the leather is nailed by the edges to a flat piece of wood, in the form of an oblong square, about a foot in length and half a foot in breadth, with a handle placed in the middle of one of the longer sides.

The teeth are made in the following manner. The wire being drawn of the size intended, a skain or number of wires are cut into proper lengths by means of a gauge, and then doubled in a tool contrived for that purpose: after which they are bent into the proper direction by means of another tool; and then placed in the leather, as mentioned above.

CARDS, among gamesters, little pieces of fine thin pasteboard of an oblong figure, of several sizes; but most commonly, in Britain, three inches and an half long and two and an half broad, on which are painted several points and figures.

The moulds and blocks for making cards are exactly like those that were used for the first printed books. They lay a sheet of wet or moist paper on the block, which is first slightly done over with a sort of ink made of lamp-black diluted in water, and mixed with some starch to give it a body. They afterwards rub it off with a round list. The court-cards are coloured by means of several patterns, styled *stane-files*. These consist of papers cut through with a penknife; and in these apertures they apply severally the various colours, as red, black, &c. These patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the pasteboard, they slightly pass over it a brush-full of colour, which, leaving it within the openings, forms the face or figure of the card.

Among sharpers, divers sorts of false and fraudulent cards have been contrived; as, 1. *Marked cards*, where the aces, kings, queens, knaves, are marked on the corners of the backs with spots of different number and order, either with clear water or water tinged with pale Indian ink, that those in the secret may distinguish them. Aces are marked with single spots on two corners opposite diagonally; kings with two spots at the same corners; knaves with the same number transversed. 2. *Breef cards*, those which are longer or broader than the rest; chiefly used at whist and piquet. The

X

broad

Carchemish
||
Cards.

Cards,
Cardamine.

broad cards are usually for kings, queens, knaves, and aces; the long for the rest. Their design is to direct the cutting, to enable him in the secret to cut the cards disadvantageously to his adversary, and draw the person unacquainted with the fraud to cut them favourably for the sharper. As the pack is placed either endwise or sidewise to him that is to cut, the long or broad cards naturally lead him to cut to them. Breef cards are sometimes made thus by the manufacturer; but, in defect of these, sharpeners pare all but the breefs with a penknife or razor. 3. *Corner bend*, denotes four cards turned down finely at one corner, to serve as a signal to cut by. 4. *Middle bend*, or Kingston-bridge, is where the tricks are bent two different ways, which causes an opening or arch in the middle, to direct likewise the cutting.

Cards were invented about the year 1390, to divert Charles VI. of France, who had fallen into a melancholy disposition. The inventor proposed, by the figures of the four suits or colours, as the French call them, to represent the four classes of men in the kingdom. By the *caurs* (hearts) are meant the *gens de coeur*, choir-men, or ecclesiastics; and therefore the Spaniards, who certainly received the use of cards from the French, have *copas*, or chalices, instead of hearts. The nobility, or prime military part of the kingdom, are represented by the ends or points of lances or pikes; and our ignorance of the meaning or resemblance of the figure induced us to call them *spades*. The Spaniards have *espadas*, swords, in lieu of pikes, which are of similar import. By diamonds are designed the order of citizens, merchants, or tradesmen, *carreaux*, (square stones, tiles, or the like): The Spaniards have a coin, *dincros*, which answers to it; and the Dutch call the French word *carreaux* "*streeneen*," stones and diamonds, from the form. *Trefle*, the trefoil leaf, or clover-grass (corruptly called *clubs*), alludes to the husbandmen and peasants. But how this suit came to be called *clubs* is not easily explained; unless, borrowing the game from the Spaniards, who have *bastos* (staves or clubs) instead of the trefoil, we give the Spanish signification to the French figure.

The history of the four kings, which the French, in drollery, sometimes call the *cards*, are David, Alexander, Cæsar, and Charles; which names were then, and still are, on the French cards. These respectable names represent the four celebrated monarchies of the Jews, Greeks, Romans, and Franks under Charlemagne. By the queens are intended Argine, Esther, Judith, and Pallas (names retained in the French cards), typical of birth, piety, fortitude, and wisdom, the qualifications residing in each person. *Argine* is an anagram for *regina*, queen by descent. By the knaves were designed the servants to knights (for *knave* originally meant only *servant*); but French pages and valets, now indiscriminately used by various orders of persons, were formerly only allowed to persons of quality, esquires (*escuires*), shield or armour bearers. Others fancy that the knights themselves were designed by those cards; because Hogier and Lahire, two names on the French cards, were famous knights at the time cards were supposed to have been invented.

Deceptions with CARDS. See LEGERDEMAIN, sect. i.

CARDAMINE, in botany: A genus of the filiquosa order, belonging to the tetradynamia class of

plants; and in the natural method ranking under the 39th order, *Siliquosæ*. The filiqua parts asunder with a spring, and the valves roll spirally backward; the stigma is entire, and the calyx a little gaping. Of this there are 15 species; but the most remarkable is the *pratensis*, with a large purplish flower. This grows naturally in many parts of Britain, and is also called *cuckow-flower*. There are four varieties, viz. the single, with purple and white flowers, which are frequently intermixed in the meadows; and the double, of both colours. The single sorts are not admitted into gardens; but the double deserve a place, as making a pretty appearance during the time they are in flower. They will thrive in a moist shady border; and are propagated by parting their roots, which is best performed in autumn. They delight in a soft loamy soil, not too stiff. By some the plant is reckoned antiscorbutic.

CARDAMOM, in the Materia Medica. See AMOMUM.

CARDAN (Jerom), one of the most extraordinary geniuses of his age, was born at Pavia on the 24th of September 1501. As his mother was not married, she tried every method to procure an abortion, but without effect. She was three days in labour, and they were at last obliged to cut the child from her. He was born with his head covered with black curled hair. When he was four years old, he was carried to Milan; his father being an advocate in that city. At the age of 20, he went to study in the university of that city; and two years afterwards he explained Euclid. In 1524, he went to Padua; and the same year he was admitted to the degree of master of arts: in the end of the following year, he took the degree of doctor of physic. He married about the year 1531. For ten years before, his impotency had hindered him from having knowledge of a woman; which was a great mortification to him. He attributed it to the evil influences of the planet under which he was born. When he enumerates, as he frequently does, the greatest misfortunes of his life, this ten years impotency is always one. At the age of 32, he became professor of mathematics at Milan. In 1539, he was admitted member of the college of physicians at Milan; in 1543, he read public lectures of medicine in that city, and at Pavia the year following; but discontinued them because he could not get payment of his salary, and returned to Milan. In 1552, he went into Scotland, having been sent for by the Archbishop of St Andrew's, who had in vain applied to the French king's physicians, and afterwards to those of the emperor of Germany. This prelate, then 40 years old, had for ten years been afflicted with a shortness of breath, which returned every eight days for the two last years. He began to recover from the moment that Cardan prescribed for him. Cardan took his leave of him at the end of six weeks and three days, leaving him prescriptions which in two years wrought a complete cure.

Cardan's journey to Scotland gave him an opportunity of visiting several countries. He crossed France in going thither; and returned through Germany, and the Low Countries, along the banks of the Rhine. It was on this occasion he went to London, and calculated king Edward's nativity. This tour took up about four months: after which, coming back to Milan, he continued there till the beginning of October 1552; and

Carda-
mom,
Cardam.

Cardan. and then went to Padua, from whence he was invited to Bologna in 1562. He taught in this last city till the year 1570; at which time he was thrown into prison; but some months after he was sent home to his own house. He left Bologna in 1571: and went to Rome, where he lived for some time without any public employment. He was, however, admitted a member of the college of physicians, and received a pension from the pope. He died at Rome on the 21st of September 1575, according to Thuanus. This account might be sufficient to show the reader that Cardan was of a very fickle temper; but he will have a much better idea of his singular and odd turn of mind by examining what he himself has written concerning his own good and bad qualities. He paid himself congratulatory compliments for not having a friend in this world; but that, in requittal, he was attended by an aerial spirit, emanated partly from Saturn and partly from Mercury, who was the constant guide of his actions, and teacher of every duty to which he was bound. He declared, too, that he was so irregular in his manner of walking the streets, as induced all beholders to point at him as a fool. Sometimes he walked very slowly, like a man absorbed in profound meditation; then all on a sudden quickened his steps, accompanying them with very absurd attitudes. In Bologna his delight was to be drawn about in a mean vehicle with three wheels. When nature did not visit him with any pain, he would procure to himself that disagreeable sensation by biting his lips so wantonly, or pulling his fingers to such a vehement degree, as sometimes to force the tears from his eyes: and the reason he assigned for so doing, was to moderate certain impetuous fallies of the mind, the violence of which was to him by far more insupportable than pain itself; and that the sure consequence of such a severe discipline was the enjoying the pleasure of health. He says elsewhere, that, in his greatest tortures of soul, he used to whip his legs with rods, and bite his left arm; that it was a great relief to him to weep, but that very often he could not; that nothing gave him more pleasure than to talk of things which made the whole company uneasy; that he spoke on all subjects, in season and out of season; and he was so fond of games of chance, as to spend whole days in them, to the great prejudice of his family and reputation, for he even staked his furniture and his wife's jewels.

Cardanus makes no scruple of owning that he was revengeful, envious, treacherous, a dealer in the black art, a backbiter, a calumniator, and addicted to all the foul and detestable excesses that can be imagined: yet, notwithstanding (as one would think) so humbling a declaration, there was never perhaps a vainer mortal, or one that with less ceremony expressed the high opinion he had of himself, than Cardanus was known to do, as will appear by the following proofs. "I have been admired by many nations: an infinite number of panegyrics, both in prose and verse, have been composed to celebrate my fame. I was born to release the world from the manifold errors under which it groaned. What I have found out could not be discovered either by my predecessors or my contemporaries; and that is the reason why those authors who write any thing worthy of being remembered, scruple not to own that they

are indebted to me for it. I have composed a book on the dialectic art, in which there is neither one superfluous letter nor one deficient. I finished it in seven days, which seems a prodigy. Yet where is there a person to be found, that can boast of his having become master of its doctrine in a year? And he that shall have comprehended it in that time, must appear to have been instructed by a familiar dæmon."

The same capriciousness observable in his outward conduct is to be observed in the composition of his works. We have a multitude of his treatises in which the reader is stopped almost every moment by the obscurity of his text, or his digressions from the point in hand. In his arithmetical performances there are several discourses on the motions of the planets, on the creation, and on the tower of Babel. In his dialectic work, we find his judgment on historians and the writers of epistles. The only apology which he makes for the frequency of his digressions is, that they were purposely done for the sooner filling up of his sheet, his bargain with the bookseller being at so much per sheet; and that he worked as much for his daily support as for the acquisition of glory. The Lyons edition of his works, printed in 1663, consists of ten volumes in folio.

It was Cardanus who revived in latter times all the secret philosophy of the Cabbala or Cabbalists, which filled the world with spirits; a likeness to whom, he asserted, we might attain by purifying ourselves with philosophy. He chose for himself, however, notwithstanding such reveries, this fine device, *Tempus mea possessio, tempus meus ager*: "Time is my sole possession, and the only fund I have to improve."

In fact, when we consider the transcendent qualities of Cardan's mind, we cannot deny his having cultivated it with every species of knowledge, and his having made a greater progress in philosophy, in the medical art, in astronomy, in mathematics, &c. than the greatest part of his contemporaries who had applied their minds but to one of those sciences.

Scaliger affirms, that Cardan, having fixed the time of his death, abstained from food, that his prediction might be fulfilled, and that his continuance to live might not discredit his art. Cardan's father, who was a doctor of medicine, and a professor of civil and canon law, died in the same manner, in the year 1524, having abstained from all sustenance for nine days. His son tells us, that he had white eyes, and could see in the night-time.

CARDASS, a sort of card, proper for carding flocks of silk, to make cappadine of it. It is also the name which the French give to those flocks of silk.

CARDASSES, is also the name which, in the cloth manufactories of Languedoc, they give to a sort of large card, which is used for carding the dyed wool, designed for making cloth of mixed colours.

CARDERS, in the woollen manufactory, are persons who prepare wool, &c. for spinning, &c.

CARDERS, spinners, weavers, fullers, sheermen, and dyers, not performing their duty in their occupations, shall yield to the party grieved double damages; to be committed until payment. One justice to hear and determine complaints.

CARDERS, combers, sorters, spinners, or weavers,

Cardi
||
Cardigan.

conveying away, embezzling, or detaining any wool or yarn, delivered by the clothier, or any other person, shall give the party grieved such satisfaction, as two justices, mayor, &c. shall think fit: if not able or willing to make satisfaction, for the first offence to be whipped, or set in the stocks in some market-town, or in any other town where the offence is committed: the second offence to incur the like, or such further punishment by whipping, &c. as justices shall think proper. Conviction by one witness on oath, or confession.

CARDI (Ludovico). See CIVOLI.

CARDIAC, in a general sense, signifies all medicines beneficial to the heart, whether internally or externally applied. The word comes from the Greek word *καρδια*, *cor*; the heart being reputed the immediate seat of their operation.

CARDIACS, in a more particular sense, denote medicines which raise the spirits, and give present strength and cheerfulness; these amount to the same with what are popularly called *cordials*. Cardiacs are medicines anciently supposed to exert themselves immediately in comforting and strengthening the heart: but the modern physicians rather suppose them to produce the effect by putting the blood into a gentle fermentation, whereby the springs, before decayed, are repaired and invigorated, and the tone and elasticity of the fibres of the vessels restored; the consequence of which is a more easy and brisk circulation.

CARDIALGIA, in medicine, a violent sensation of heat or acrimony felt towards the upper or left orifice of the stomach, though seemingly at the heart; sometimes accompanied with palpitations of the heart, fainting, and a propensity to vomit: better known by the name of *cardiac passion*, or *heart-burn*. See (*Index subjoined to*) MEDICINE.

CARDIFF, a town of Glamorganshire, in South Wales, seated on the river Tawe, in a rich and fruitful soil. It is a large, compact, well-built town, having a castle, a wall, and four gates, built by Robert Fitz-Hamon, a Norman, about the year 1100. It is governed by the constable of the castle, 12 aldermen, 12 burgeses, &c. and sends one member to parliament. Here the assizes and sessions are held, besides several courts. There is a handsome bridge over the river, to which small vessels come to take in their lading. It has now only one church, St Mary's having been long since thrown down by the undermining of the river. The castle, though much decayed, makes a grand appearance even at this time; and the walls of the town are very strong and thick. The church has a fine tower-splee, and the town-hall is a good structure. The magistrates are elected every year by the majority of the burgeses. W. Long. 3. 20. N. Lat. 51. 30. Cardiff gives title of British Baron to the family of Bute in Scotland.

CARDIGAN, the capital town of Cardiganshire, in South Wales, is seated near the mouth of the river Teivy, on the Irish channel. It is indifferently large and well-built, containing three wards, one church, and the county-gaol. It is governed by a mayor, 13 aldermen, 13 common-council men, &c. Here are the ruins of a castle which was built by Gilbert de Clare, about the year 1160. It sends one member to Parliament; and has two markets, held on Tuesdays and Saturdays. W. Long. 4. 38. N. Lat. 52. 15.

CARDIGANSHIRE, a county of South Wales, bounded on the north by Merionethshire and Montgomeryshire, on the east by Radnorshire and Brecknockshire, on the west by the Irish Sea, and on the south by Caermarthenshire. Its length from north-west to south-east is about 44 miles, and its breadth near 20. The air, as in other parts of Wales, varies with the soil, which in the southern and western parts is more upon a level than this principality generally is, which renders the air mild and temperate. But as the northern and eastern parts are mountainous, they are consequently more barren and bleak. However, there are cattle bred in all parts; but they have neither wood nor coals of their own for fuel: they have rich lead mines, and fish in plenty, with fowls both tame and wild. The principal rivers are the Teivy, the Ridol, and the Istwith. This county hath five market-towns, *viz.* Cardigan, Aberistwith, Llanbadarnvawn, Llanbedar, and Tregaron, with 77 parishes; and was formerly computed to have upward of 3000 houses, and 520,000 acres of land. It sends two members to parliament; one for the county, and one for Cardigan.

CARDINAL, in a general sense, an appellation given to things on account of their pre-eminence. The word is formed of the Latin *cardo*, a hinge; it being on these fundamental points that all the rest of the same kind are supposed to turn. Thus, justice, prudence, temperance, and fortitude, are called the four *cardinal virtues*, as being the basis of all the rest.

CARDINAL Flower, in botany. See LOBELIA.

CARDINAL Points, in cosmography, are the four intersections of the horizon with the meridian, and the prime vertical circle. Of these, two, *viz.* the intersections of the horizon and meridian, are called *North* and *South*, with regard to the poles they are directed to. The other two, *viz.* the intersections of the horizon, and first vertical, are called *East* and *West*.

The cardinal points, therefore, coincide with the four cardinal regions of the heavens; and are 90° distant from each other. The intermediate points are called *collateral points*.

CARDINAL Points, in astrology, are the rising and setting of the sun, the zenith, and nadir.

CARDINAL Signs, in astronomy, are Aries, Libra, Cancer, and Capricorn.

CARDINAL Winds, are those that blow from the cardinal points.

CARDINAL Numbers, in grammar, are the numbers one, two, three, &c. which are indeclinable; in opposition to the ordinal numbers, first, second, third, fourth, &c.

CARDINAL, an ecclesiastical prince in the Romish church, being one who has a voice in the conclave at the election of a pope. Some say the cardinals were so called from the Latin *incardinatio*, which signifies the adoption in any church made of a priest of a foreign church, driven thence by misfortune; and add, that the use of the word commenced at Rome and Ravenna; the revenues of the churches of which cities being very great, they became the common refuge of the unhappy priests of all other churches.

The cardinals compose the pope's council or senate: in the Vatican is a constitution of pope John, which regulates the rights and titles of the *cardinals*; and

Cardigan-

||
Cardinal.]

Cardinal. which declares, that as the pope represents Moses, so the cardinals represent the seventy elders, who, under the pontifical authority, decide private and particular differences.

Cardinals, in their first institution, were only the principal priests, or incumbents of the parishes of Rome. In the primitive church, the chief priest of a parish, who immediately followed the bishop, was called *presbyter cardinalis*, to distinguish him from the other petty priests, who had no church nor preferment; the term was first applied to them in the year 150; others say, under pope Silvester, in the year 300. These cardinal priests were alone allowed to baptize, and administer the eucharist. When the cardinal-priests became bishops, their cardinalate became vacant; they being then supposed to be raised to a higher dignity.—Under pope Gregory, cardinal priests, and cardinal deacons, were only such priests or deacons as had a church or chapel under their particular care: and this was the original use of the word. Leo IV. in the council of Rome, held in 853, calls them *presbyteros sui cardinis*; and their churches, *parochias cardinales*.

The cardinals continued on this footing till the eleventh century: but as the grandeur and state of his holiness became then exceedingly augmented, he would have his council of cardinals make a better figure than the ancient priests had done. It is true, they still preserved their ancient title; but the thing expressed by it was no more. It was a good while, however, before they had the precedence over bishops, or got the election of the pope into their hands; but when they were once possessed of those privileges, they soon had the red hat and purple; and growing still in authority, they became at length superior to the bishops, by the sole quality of being cardinals.

Du-Cange observes, that originally there were three kinds of churches: the first or genuine churches were properly called *parishes*; the second, *deaconries*, which were chapels joined to hospitals, and served by deacons; the third were simple *oratories*, where private masses were said, and were discharged by local and resident chaplains. He adds, that, to distinguish the principal or parish churches from the chapels and oratories, the name *cardinales* was given to them. Accordingly, parish churches gave titles to cardinal priests; and some chapels also, at length, gave the title of *cardinal deacons*.

Others observe, that the term *cardinal* was given not only to priests, but also to bishops and deacons who were attached to certain churches, to distinguish them from those who only served them *en passant*, and by commission. Titular churches, or benefices, were a kind of parishes, i. e. churches assigned each to a cardinal priest; with some stated district depending on it, and a font for administering of baptism, in cases where the bishop himself could not administer it. These cardinals were subordinate to the bishops; and accordingly, in councils, particularly that held at Rome in 868, subscribed after them.

It was not, however, only at Rome, that priests bore this name; for we find there were cardinal priests in France: thus, the curate of the parish of St John de Vignes is called in old charters the *cardinal priest* of that parish.

Cardinal. The title of *cardinal* is also given to some bishops, *quatenus* bishops; e. g. to those of Mentz and Milan: the archbishop of Bourges is also, in ancient writings, called *cardinal*; and the church of Bourges, a *cardinal church*. The abbot of Vendome calls himself *cardinalis natus*.

The cardinals are divided into three classes or orders; containing six bishops, fifty priests, and fourteen deacons; making in all seventy: which constitute what they call the *sacred college*. The cardinal bishops, who are, as it were, the pope's vicars, bear the titles of the bishopricks assigned to them; the rest take such titles as are given them: the number of cardinal bishops has been fixed; but that of cardinal priests and deacons, and consequently the sacred college itself, is always fluctuating. Till the year 1125, the college only consisted of fifty-two or fifty-three: the council of Constance reduced them to twenty-four; but Sixtus IV. without any regard to that restriction, raised them again to fifty-three, and Leo to sixty-five. Thus, as the number of cardinal priests was anciently fixed to twenty-eight, new titles were to be established, in proportion as new cardinals were created. As for the cardinal deacons, they were originally no more than seven for the fourteen quarters of Rome; but they were afterwards increased to nineteen, and after that were again diminished.

According to Onuphrius, it was pope Pius IV. who first enacted, in 1562, that the pope should be chosen only by the senate of cardinals; whereas, till that time, the election was by all the clergy of Rome. Some say, the election of the pope rested in the cardinals, exclusive of the clergy, in the time of Alexander III. in 1160. Others go higher still, and say, that Nicholas II. having been elected at Sienna, in 1058, by the cardinals alone, occasioned the right of election to be taken from the clergy and people of Rome; only leaving them that of confirming him by their consent; which was at length, however, taken from them. See his decree for this purpose, issued in the Roman council of 1059, in Hardouin's *Acta Conciliorum*, tom. vi. pt. i. p. 1165. Whence it appears, that the cardinals who had the right of suffrage in the election of his successors, were divided by this pontiff into *cardinal bishops* and *cardinal clerks*: meaning by the former the seven bishops who belonged to the city and territory of Rome; and by the latter, the *cardinal presbyters* or ministers of the twenty-eight Roman parishes, or principal churches. To these were added, in process of time, under Alexander III. and other pontiffs, new members, in order to appease the tumults occasioned by the edict of Nicholas II.

At the creation of a new cardinal, the pope performs the ceremony of opening and shutting his mouth; which is done in a private consistory. The shutting his mouth implies the depriving him of the liberty of giving his opinion in congregations; and the opening his mouth, which is performed 15 days after, signifies the taking off this restraint. However, if the pope happens to die during the time a cardinal's mouth is shut, he can neither give his voice in the election of a new pope, nor be himself advanced to that dignity.

The dress of a cardinal is a red soutane, a rocket, a short purple mantle, and a red hat.

The

Cardinal
||
Careening.

The cardinals began to wear the red hat at the council of Lyons, in 1243. The decree of pope Urban VIII. whereby it is appointed, that the cardinals be addressed under the title of *eminence*, is of the year 1630; till then, they were called *illustrissimi*.

When cardinals are sent to the courts of Princes, it is in quality of legates *a latore*; and when they are appointed governors of towns, their government is called by the name of *legation*.

CARDINAL has also been applied to secular officers. Thus, the prime ministers in the court of the emperor Theodosius, are called *cardinales*. Cassiodorus, lib. vii. formul. 31. makes mention of the cardinal prince of the city of Rome; and in the list of officers of the duke of Bretagne, in 1447, we meet with one Raoul de Thorel, cardinal of Quillart, chancellor, and servant of the viscount de Rohan: which shows it to have been an inferior quality.

CARDIOID, in the higher geometry, an algebraical curve, so called from its resemblance to an heart.

CARDIOSPERMUM, in botany: A genus of the trigynia order, belonging to the octandria class of plants; and in the natural method ranking under the 39th order, *Tribilata*. The calyx is tetraphyllous, the petals four, the nectarium tetraphyllous and unequal; the capsules three, grown together, and inflated. There are two species, both natives of the East and West Indies; but have no great beauty, or any other remarkable property.

CARDIUM, or COCKLE, in zoology, a genus of insects belonging to the order of vermes testaceæ. The shell consists of two equal valves, and the sides are equal. There are 21 species of this genus. Common on all sandy coasts, lodged a little beneath the sand; their place marked by a depressed spot. They are wholesome and delicious food.

CARDONA, a handsome town of Spain, in Catalonia, with a strong castle, and the title of a duchy. Near it is an inexhaustible mountain of salt of several colours, as red, white, carnation, and green: but when washed, it becomes white. There are also vineyards which produce excellent wine, and very lofty pine-trees. It is seated on an eminence, near the river Cardenero. E. Long. 1. 26. N. Lat. 41. 42.

CARDUUS, in botany: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The calyx is ovate, imbricated with prickly scales, and the receptacle hairy. Of this genus there are 26 species, ten of which are natives of Britain, and being troublesome weeds require no description. Some few of the exotic kinds are propagated in gardens for the sake of variety; but even these have neither beauty nor any other property to recommend them.

CARDUUS *Benedictus*. See CNICUS.

CAREENING, in the sea-language, the bringing a ship to lie down on one side, in order to trim and caulk the other side.

A ship is said to be brought to the careen, when, the most of her lading being taken out; she is hulled down on one side, by a small vessel, as low as necessary; and there kept by the weight of the ballast, ordnance, &c. as well as by ropes, lest her masts should be strained too much; in order that her sides and bottom may be

trimmed, seams caulked, or any thing that is faulty under water mended. Hence, when a ship lies on one side when she sails, she is said to fail on the careen.

CAREER, in the manege, a place inclosed with a barrier, wherein they run the ring.

The word is also used for the race or course of the horse itself, provided it do not exceed 200 paces.

In the ancient circus, the career was the space the bigæ, or quadrigæ, were to run at full speed, to gain the prize. See CIRCUS.

CAREER, in falconry, is a flight or tour of the bird, about 120 yards. If she mount more, it is called a *double career*; if less, a *semi-career*.

CARELIA, the eastern province of Finland; divided into Swedish Carelia, and Muscovite Carelia. The capital of the latter is Povenza, and of the former Weiburg.

CARELSCROON, a sea-port town of Sweden, in Blekingia, or Bleking, on the Baltic Sea, with a very good harbour defended by two forts. It was built in 1679; and is very populous, with arsenals for the marine: the house of the director-general of the admiralty is in this town, and here the Swedes lay up their royal navy. E. Long. 15. 5. N. Lat. 56. 15.

CARENTAN, a town of France in Lower Normandy, and in the Contentin, with an ancient castle. W. Long. 1. 14. N. Lat. 49. 20.

CARET, among grammarians, a character marked thus 4, signifying that something is added on the margin, or interlined, which ought to come in where the caret stands.

CAREW (George), born in Devonshire in 1557, an eminent commander in Ireland, was made president of Munster by queen Elizabeth; when, joining his forces with the earl of Thomond, he reduced the Irish insurgents, and brought the earl of Desmond to his trial. King James made him governor of Guernsey, and created him a baron. As he was a valiant commander, he was no less a polite scholar; and wrote *Pacata Hibernia*, a history of the late wars in Ireland, printed after his death, in 1633. He made several collections for a history of Henry V. which are digested into Speed's History of Great Britain. Besides these, he collected materials of Irish history in four large MSS. volumes, now in the Bodleian library, Oxford.

CAREW (Thomas), descended from the family of Carew in Gloucestershire, was gentleman of the privy chamber to Charles I. who always esteemed him one of the most celebrated wits of his court. He was much respected by the poets of his time, particularly by Ben Johnson and Sir William Davenant; and left behind him several poems, and a masque called *Calum Britannicum*, performed at Whitehall on Shrove Tuesday night, 1633, by the king, and several of his nobles with their sons. Carew was assisted in the contrivance by Inigo Jones, and the music was set by Mr Henry Lawes of the king's chapel. He died in the prime of life, about the year 1639.

CAREW (Richard), author of the "Survey of Cornwall," was the eldest son of Thomas Carew of East Anthony, and was born in 1555. When very young, he became a gentleman commoner of Christ-church college, Oxford; and at 14 years of age had the honour of disputing, extempore, with the afterwards famous

Career

Carew.

Carew.

mous Sir Philip Sydney, in the presence of the earls of Leicester, Warwick, and other nobility. After spending three years at the university, he removed to the Middle Temple, where he resided the same length of time, and then travelled into foreign parts. Not long after his return to England, he married, in 1577, Juliana Arundel, of Trerice. In 1581, Mr Carew was made justice of the peace, and in 1586 was appointed high-sheriff of the county of Cornwall; about which time he was likewise queen's deputy for the militia. In 1589, he was elected a member of the college of Antiquaries, a distinction to which he was intitled by his literary abilities and pursuits. What particularly engaged his attention was his native county, his "Survey" of which was published, in 4to, at London, in 1602. It hath been twice reprinted, first in 1723, and next in 1769. Of this work Camden hath spoken in high terms, and acknowledges his obligations to the author. In the present improved state of topographical knowledge, and since Dr Borlase's excellent publications relative to the county of Cornwall, the value of Carew's "Survey" must have been greatly diminished. Mr Gough remarks, that the history and monuments of this county were faintly touched by Carew; but it is added, that he was a person extremely capable of describing them, if the infancy of those studies at that time had afforded light and materials. Another work of our author was a translation from the Italian, intituled, "The Examination of Men's Wits. In which, by discovering the variety of natures, is showed for what profession each one is apt, and how far he shall profit therein." This was published at London in 1594, and afterwards in 1604; and tho' Richard Carew's name is prefixed to it, hath been principally ascribed by some persons to his father. According to Wood, Carew wrote also, "The true and ready Way to learn the Latin Tongue," in answer to a query, whether the ordinary method of teaching the Latin by the rules of grammar be the best mode of instructing youths in that language? This tract is involved in Mr Hartlib's book upon the same subject, and with the same title. It is certain that Carew was a gentleman of considerable abilities and literature, and that he was held in great estimation by some of the most eminent scholars of his time. He was particularly intimate with Sir Henry Spelman, who extols him for his ingenuity, virtue, and learning.

CAREW (George), brother to the subject of the last article, was educated in the university of Oxford, after which he studied the law in the inns of court, and then travelled to foreign countries for farther improvement. On his return to his native country, he was called to the bar, and after some time was appointed secretary to Sir Christopher Hatton lord chancellor of England. This was by the especial recommendation of queen Elizabeth herself, who gave him a prothonotaryship in the chancery, and conferred upon him the honour of knighthood. In 1597, Sir George Carew, who was then a master in chancery, was sent ambassador to the king of Poland. In the next reign, he was one of the commissioners for treating with the Scotch concerning an union between the two kingdoms; after which he was appointed ambassador to the court of France, where he continued from the latter end of the year 1605 till

1609. During his residence in that country, he formed an intimacy with Thuanus, to whom he communicated an account of the transactions in Poland whilst he was employed there, which was of great service to that admirable author in drawing up the 121st book of his history. After Sir George Carew's return from France, he was advanced to the important post of master of the court of Wards, which honourable situation he did not long live to enjoy; for it appears from a letter written by Thuanus to Camden in the spring of 1613, that he was then lately deceased. Sir George Carew married Thomasine, daughter of Sir Francis Godolphin, great-grandfather of the lord treasurer Godolphin, and had by her two sons and three daughters. When Sir George Carew returned, in 1609, from his French embassy, he drew up, and addressed to James I. "A Relation of the State of France, with the characters of Henry IV. and the principal Persons of that Court." The characters are drawn from personal knowledge and close observation, and might be of service to a general historian of that period. The composition is perspicuous and manly, and entirely free from the pedantry which prevailed in the reign of James I. but this is the less surprising, as Sir George Carew's taste had been formed in a better æra, that of queen Elizabeth. The valuable tract we are speaking of lay for a long time in MS. till happily falling into the hands of the earl of Hardwicke, it was communicated by him to Dr Birch, who published it, in 1749, at the end of his "Historical View of the Negotiations between the Courts of England, France, and Brussels, from 1592 to 1617." That intelligent and industrious writer justly observes, that it is a model upon which ambassadors may form and digest their notions and representations; and the late celebrated poet Mr Gray hath spoken of it as an excellent performance.

CAREY (Harry), a man distinguished by both poetry and music, but perhaps more so by a certain facetiousness, which made him agreeable to every body. He published in 1720 a little collection of poems; and in 1732, six cantatas, written and composed by himself. He also composed sundry songs for modern comedies, particularly those in the "Provoked Husband;" he wrote a farce called "The Contrivances," in which were several little songs to very pretty airs of his own composition: he also made two or three little dramas for Goodman's-fields theatre, which were very favourably received. In 1729, he published by subscription his poems much enlarged: with the addition of one intituled "Namby Pamby," in which Ambrose Philips is ridiculed. Carey's talent, says his historian, lay in humour and unmalevolent satire: to ridicule the rant and bombast of modern tragedies he wrote one, to which he gave the strange title of "Chrononhotonthologos," acted in 1734. He also wrote a farce called "The Honest Yorkshireman." Carey was a thorough Englishman, and had an unsurmountable aversion to the Italian opera and the singers in it: he wrote a burlesque opera on the subject of the "Dragon of Wantley;" and afterwards a sequel to it, intituled, "The Dragoness;" both which were esteemed a true burlesque upon the Italian opera. His qualities being of the entertaining kind, he was led in-

Carew,
Carey.

Cargadors
||
Caribbee
Islands.

to more expences than his finances could bear, and thus was frequently in distress. His friends however were always ready to assist him by their little subscriptions to his works: and encouraged by these, he republished, in 1740, all the songs he had ever composed, in a collection, intituled, "The Musical Century, in 100 English Ballads, &c." and, in 1743, his dramatic works, in a small volume, 4to. With all his mirth and good-humour, he seems to have been at times deeply affected with the malevolence of some of his own profession, who, for reasons that no one can guess at, were his enemies: and this, with the pressure of his circumstances, is supposed to have occasioned his untimely end; for, about 1744, in a fit of desperation, he laid violent hands on himself, and, at his house in Warner-street, Cold-bath Fields, put a period to a life, which, says Sir John Hawkins, had been led without reproach. It is to be noted, and it is somewhat singular in such a character, that in all his songs and poems on wine, love, and such kind of subjects, he seems to have manifested an inviolable regard for decency and good manners.

CARGADORS, a name which the Dutch give to those brokers whose business is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to send by sea, of the ships that are ready to sail, and of the places for which they are bound.

CARGAPOL, or KARGAPOL, the capital of a territory of the same name, in the province of Dwina, in Muscovy: E. Long. 36°. N. Lat. 63°.

CARGO denotes all the merchandises and effects which are laden on board a ship.

Super-CARGO, a person employed by merchants to go a voyage, oversee the cargo, and dispose of it to the best advantage.

CARIA (anc. geog.), a country of the Hither Asia; whose limits are extended by some, while they are contracted by others. Mela, Pliny, extend the maritime Caria from Jasus and Halicarnassus, to Calynda, and the borders of Lycia. The inland Caria Ptolemy extends to the Meander and beyond. *Car*, *Cariates*, *Cariatis*, *Carissa*, and *Caris*, and *Caira*, are the gentilitious names; *Carius* and *Caricus* the epithets. In *Care periculum*, was a proverbial saying on a thing exposed to danger, but of no great value. The *Cares* being the Swiss of those days, were hired and placed in the front of the battle, (Cicero.) *Cum Care Carissa*, denoted the behaviour of clowns. The *Cares* came originally from the islands to the continent, being formerly subject to Minos, and called *Leleges*: this the Cretans affirm, and the *Cares* deny, making themselves aborigines. They are of a common original with the Mysi and Lydi, having a common temple, of a very ancient standing, at Melassa, a town of Caria, called *Jovis Carii Delubrum*, (Herodotus.) Homer calls the Carians, barbarians in language.

CARIATI, a town of Italy, in the kingdom of Naples, and province of Hither Calabria, with a bishop's see, and the title of a principality. It is two miles from the gulf of Taranto, and 37 north-east of Cosenza. E. Long. 17. 19. N. Lat. 30. 38.

CARIBBEE ISLANDS, a cluster of islands situated in the Atlantic ocean between 59 and 63 degrees of N°. 65.

west longitude, and between 11 and 18 degrees of north latitude. They lie in the form of a bow or semicircle, stretching almost from the coast of Florida north, to near the river Oronoque. Those that lie nearest the east have been called the *Windward Islands*, the others the *Leeward*, on account of the winds blowing generally from the eastern point in those quarters. Abbé Raynal conjectures them to be the tops of very high mountains formerly belonging to the continent, which have been changed into islands by some revolution that has laid the flat country under water. The direction of the Caribbee islands, beginning from Tobago, is nearly north and N. N. W. This direction is continued forming a line somewhat curved towards the north-west, and ending at Antigua. In this place the line becomes at once curved; and extending itself in a straight direction to the west and north-west, meets in its course with Porto-Rico, St Domingo, and Cuba, known by the name of the *Leeward Islands*, which are separated from each other by channels of various breadths. Some of these are six, others 15 or 20 leagues broad; but in all of them the soundings are from 100 to 120 or 150 fathoms. Between Grenada and St Vincent's there is also a small archipelago of 30 leagues, in which the soundings are not above ten fathom. The mountains in the Caribbee islands run in the same direction as the islands themselves. The direction is so regular, that if we were to consider the tops of these mountains only, independent of their bases, they might be looked upon as a chain of hills belonging to the continent, of which Martinico would be the most north-westerly promontory. The springs of water which flow from the mountains in the Windward Islands, run all in the western parts of these islands. The whole eastern coast is without any running water. No springs come down there from the mountains: and indeed they would have there been useless; for after having run over a very short tract of land, and with great rapidity, they would have fallen into the sea. In Porto Rico, St Domingo, and Cuba, there are a few rivers that discharge themselves on the northern side, and whose sources rise in the mountains running from east to west, that is, thro' the whole length of these islands. From the other side of the mountains facing the south, where the sea, flowing with great impetuosity, leaves behind it marks of its inundations, several rivers flow down, the mouths of which are capable of receiving the largest ships. The soil of the Caribbees consists mostly of a layer of clay or gravel of different thickness; under which is a bed of stone or rock. The nature of some of those soils is better adapted to vegetables than others. In those places where the clay is drier and more friable, and mixes with the leaves and remains of plants, a layer of earth is formed of greater depth than where the clay is moister. The sand or gravel has different properties according to its peculiar nature; wherever it is less hard, less compact, and less porous, small pieces separate themselves from it, which, though dry, preserve a certain degree of coolness useful to vegetation. This soil is called in America a *pumice-stone* soil. Wherever the clay and gravel do not go through such modifications, the soil becomes barren, as soon as the layer formed by the decomposition of the original plants is destroyed.—By a treaty concluded in January 1660,

Caribbee
Islands.

between

Certhia, Hook-billed.

Certhia, Cardinal.

Carabus.

Caribbee. between the French and English, the Caribs were confined to the islands of St Vincent's and Dominica, where all the scattered body of this people were united, and at that time did not exceed in number 6000 men. See ST VINCENT'S and DOMINICA.

As the Caribbee islands are all between the tropics, their inhabitants are exposed, allowing for the varieties resulting from difference of situation and soil, to a perpetual heat, which generally increases from the rising of the sun till an hour after noon, and then declines in proportion as the sun declines. The variations of the temperature of the air seem to depend rather on the wind than on the changes of the seasons. In those places where the wind does not blow, the air is excessively hot, and none but the easterly winds contribute to temper and refresh it: those that blow from the south and west afford little relief; but they are much less frequent and less regular than that which blows from the east. The branches of the trees exposed to the influence of the latter are forced round towards the west: but their roots are stronger, and more extended under the ground, towards the east than towards the west; and hence they are easily thrown down by strong west winds or hurricanes from that quarter. The easterly wind is scarce felt in the Caribbee islands before 9 or 10 o'clock in the morning, increases in proportion as the sun rises above the horizon, and decreases as it declines. Towards the evening it ceases entirely to blow on the coasts, but not on the open sea. It has also been observed, that it blows with more force, and more regularity, in the dog-days than at any other time of the year.

The rain also contributes to the temperature of the Caribbee islands, though not equally in them all. In those places where the easterly wind meets with nothing to oppose its progress, it dispels the clouds as they begin to rise, and causes them to break either in the woods or upon the mountains. But whenever the storms are too violent, or the blowing of the easterly wind is interrupted by the changeable and temporary effect of the southerly and westerly ones, it then begins to rain. In the other Caribbee islands, where this wind does not generally blow, the rains are so frequent and plentiful, especially in the winter season, which lasts from the middle of July to the middle of October, that, according to the most accurate observations, as much rain falls in one week as in our climates in a year. Instead of those mild refreshing showers which fall in the European climates, the rains of the Caribbee islands are torrents, the sound of which might be mistaken for hail, were not that almost totally unknown under so burning a sky. These showers indeed refresh the air; but they occasion a dampness, the effects of which are not less disagreeable than fatal. The dead must be interred within a few hours after they have expired. Meat will not keep sweet above 24 hours. The fruits decay, whether they are gathered ripe or before their maturity. The bread must be made up into biscuits, to prevent its growing mouldy. Common wines turn sour, and iron turns rusty, in a day's time. The seeds can only be preserved by constant attention and care, till the proper season returns for sowing them. When the Caribbee islands were first discovered, the corn that was conveyed there for the support of the Europeans, was so soon damaged, that it

became necessary to send it out in the ears. This necessary precaution so much enhanced the price of it, that few were able to purchase it. Flour was then substituted in lieu of corn; which lowered indeed the expences of transport, but had this inconvenience, that it was sooner damaged. It was imagined by a merchant, that if the flour were entirely separated from the bran, it would have the double advantage of being cheaper and keeping longer. He caused it therefore to be sifted, and put the finest flour into strong casks, and beat it close together with iron hammers, till it became so close a body that the air could scarcely penetrate it. This method was found to answer the purpose; and if, by it, the flour cannot be preserved as long as in our dry and temperate climates, it may be kept for six months, a year, or longer, according to the degree of care taken in the preparation.

However troublesome these effects of the rain may be, it is attended with some others still more formidable; namely, frequent and dreadful earthquakes. These happening generally during the time or towards the end of the rainy season, and when the tides are highest, some ingenious naturalists have supposed that there might be a connection between them. The waters of the sky and of the sea undermine, dig up, and ravage the earth in several different ways. Among the various shocks to which the Caribbee islands are exposed from the fury of the boisterous ocean, there is one distinguished by the name of *raz de maree*, or *whirlpool*. It constantly happens once, twice, or thrice, from July to October, and always on the western coasts, because it takes place after the time of the westerly or southerly winds, or while they blow. The waves, which at a distance seem to advance gently within 400 or 500 yards, suddenly swell against the shore, as if acted upon in an oblique direction by some superior force, and break with the greatest impetuosity. The ships which are then upon the coast, or in the roads beyond it, unable either to keep their anchors or to put out to sea, are dashed to pieces against the land, and all on board most commonly perish. The hurricane is another terrible phenomenon in these islands, by which incredible damage is occasioned; but happily it occurs not often.

The produce of the Caribbee islands is exceedingly valuable to the Europeans, consisting of sugar, rum, molasses, indigo, &c. a particular account of which is given under the names of the respective islands as they occur in the order of the alphabet.

CARIBBIANA, or CARIBIANA, the north east coast of Terra Firma, in South America, otherwise called *New ANDALUSIA*.

CARICA, the PAPAW; A genus of the decandria order, belonging to the diœcia class of plants; and in the natural method ranking under the 38th order, *Tri-cocca*. The calyx of the male almost none; the corolla is quinquefid and funnel-shaped; the filaments in the tube of the corolla, a longer and shorter one alternately. The calyx of the female quinqueidentated; the corolla is pentapetalous, with five stigmata; the fruit an unilocular and polyspermous berry.

Species. 1. The papaya rises with a thick, soft, herbaceous stem, to the height of 18 or 20 feet, naked till within two or three feet of the top. The leaves come out on every side, upon very long footstalks.

Carica.

Those which are situated undermost are almost horizontal, but those on the top are erect: these leaves in full grown plants are very large, and divided into many lobes deeply sinuated. The stem of the plant, and also the footstalks of the leaves, are hollow. The flowers of the male plant are produced from between the leaves on the upper part of the plant. They have footstalks near two feet long; at the end of which the flowers stand in loose clusters, each having a separate short footstalk: these are of a pure white, and have an agreeable odour. The flowers of the female papaya also come out from between the leaves towards the upper part of the plant, upon very short footstalks, sitting close to the stem: they are large, and bell-shaped, composed of six petals, and are commonly yellow; when these fall away, the germen swells to a large fleshy fruit, of the size of a small melon. These fruits are of different forms: some angular, and compressed at both ends; others oval, or globular; and some pyramidal. The fruit, and all the other parts of the tree abound with a milky acrid juice, which is applied for killing of ring-worms. When the roundish fruit are nearly ripe, the inhabitants of India boil and eat them with their meat as we do turnips. They have somewhat the flavour of a pompion. Previous to boiling they soak them for some time in salt and water, to extract the corrosive juice; unless the meat they are to be boiled with should be very salt and old, and then this juice being in them will make it as tender as a chicken. But they mostly pickle the long fruit, and thus they make no bad succedaneum for mango. The buds of the female flowers are gathered, and made into a sweet-meat; and the inhabitants are such good managers of the produce of this tree, that they boil the shells of the ripe fruit into a repast, and the insides are eaten with sugar in the manner of melons.—The stem being hollow, has given birth to a proverb in the West-India islands; where, in speaking of a dissembling person, they say he is as hollow as a *Popo*.

2. The *profoposa*, differs from the other in having a branching stalk, the lobes of the leaves entire, the flower of a rose colour, and the fruit shaped like a pear, and of a sweeter flavour than the papaya.

Culture, &c. These plants being natives of hot countries, cannot be preserved in Britain unless constantly kept in a warm stove, which should be of a proper height to contain them. They are easily propagated by seeds, which are annually brought in plenty from the West Indies, though the seeds of the European plants ripen well. The seeds should be sown in a hot-bed early in the spring: when the plants are near two inches high, they should be removed into separate small pots, and each plunged into a hot-bed of tanners bark, carefully shading them from the sun till they have taken root; after which, they are to be treated in the same manner as other tender exotics. When they are removed into other pots, care must be taken as much as possible to preserve the ball of earth about them, because wherever their roots are laid bare they seldom survive. When they are grown to a large size, they make a noble appearance with their strong upright stems, garnished on every side near the top with large shining leaves, spreading out near three feet all round the stem: the flowers of the male sort coming

out in clusters on every side, and the fruit of the female growing round the stalks between the leaves, are so different from any thing of European production, as well to intitle these plants to a place in the gardens of the curious. The fruit of the first species is by the inhabitants of the Caribbee islands eaten with pepper and sugar as melons, but is much inferior to a melon in its native country; but those which have ripened in Britain were detestable: the only use to which Mr Miller says he has known them put was, when they were about half grown, to soak them in salt water to get out the acrid juice, and then pickle them for onangos, to which they are a good substitute.

CARICATURA, in painting, denotes the concealment of real beauties, and the exaggeration of blemishes, but still so as to preserve a resemblance of the object. The word is Italian; formed of *carica*, a load, burden, or the like.

CARICOUS, an epithet given to such tumors as resemble the figure of a fig. They are frequently found in the piles.

CARIES, the corruption or mortification of a bone. See MEDICINE and SURGERY, *Index*.

CARIGNAN, a fortified town of Piedmont, situated on the river Po, about seven miles south of Turin. E. Long. 7. 25. N. Lat. 44. 30. It was taken in 1544 by the French; who demolished the fortifications, but spared the castle. It was also taken, and retaken, in 1691.

CARILLONS, a species of chimes frequent in the low countries, particularly at Ghent and Antwerp, and played on a number of bells in a belfrey, forming a complete series or scale of tones and semitones, like those on the harpsichord and organ. There are petals communicating with the great bells, upon which the *carillonneur* with his feet plays the base to sprightly airs, performed with the two hands upon the upper species of keys. These keys are projecting sticks, wide enough asunder to be struck with violence and velocity by either of the hands edgeways, without the danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard against the violence of the stroke. These carillons are heard through a large town.

CARINA, a Latin term, properly signifying the keel of a ship; or that long piece of timber running along the bottom of the ship from head to stern, upon which the whole structure is built or framed.

CARINA is also frequently used for the whole capacity or bulk of a ship; containing the hull or all the space below the deck. Hence the word is also sometimes used by a figure for the whole ship.

CARINA is also used in the ancient architecture. The Romans gave the name *carina* to all buildings in form of a ship, as we still give the name *nave* to the middle or principal vault of our Gothic churches; because it has that figure.

CARINA, among anatomists, is used to denote the *spina dorsa*; as likewise for the fibrous rudiments or embryo of a chick appearing in an incubated egg. The carina consists of the entire *vertebrae*, as they appear after ten or twelve days incubation. It is thus called, because crooked in form of the keel of a ship—Botanists.

Caricatura

Carina.

Carinola
||
Caristo.

nists also, for the like reason, use the word *carina*, to express the lower petalum of a papilionaceous flower.

CARINÆ were also weepers or women hired among the ancient Romans to weep at funerals: they were thus called from *Caria*, the country whence most of them came.

CARINOLA, an episcopal town of Italy, in the kingdom of Naples, and Terra di Lavoro. E. Long. 15. 5. N. Lat. 41. 15.

CARINTHIA, a duchy of Germany, in the circle of Austria, bounded by the archbishopric of Saltzburg on the north, and by Carniola and the Venetian territories on the south, on the west by Tyrol, and on the east by Stiria. A part of this country was anciently called *Carnia*, and the inhabitants *Carni*; but the former afterwards obtained the name of *Carinthia*, and the latter *Carantani* or *Carinthe*. The air of this country is cold, and the soil in general mountainous and barren; but there are some fruitful dales and valleys in it, which produce wheat and other grain. The lakes, brooks, and rivers, which are very numerous, abound with fish; and the mountains yield lead and iron, and in many places are covered with woods. The river Drave, which runs across the country, is the most considerable in Carinthia. The inhabitants are partly descendants of the ancient Germans, and partly of the Slavonians or Wends. The states are constituted as in Austria, and their assemblies are held at Clagenfurt. The archbishop of Saltzburg and the bishop of Bamberg have considerable territories in this country. Christianity was planted here in the 7th century. The only profession tolerated at present is the Roman Catholic. The bishops are those of Gurk and Lavant, who are subject to the archbishop of Saltzburg. This duchy was formerly a part of Bavaria. In the year 1282, the emperor Rodolph I. gave it to Maynad count of Tyrol, on condition that when his male issue failed, it should revert to the house of Austria; which happened in 1331. Carinthia has its particular governor or *land-captain*, as he is called; and contributes annually towards the expence of the military establishment 637,695 florins. Only one regiment of foot is usually quartered in it.

CARIPI, a kind of cavalry in the Turkish army. The caripi, to the number of about 1000, are not slaves, nor bred up in the seraglio, like the rest; but are generally Moors or renegado Christians, who having followed adventures, being poor, and having their fortune to seek by their dexterity and courage, have arrived at the rank of horse-guards to the Grand Signior.

CARISSA, in botany: A genus of the monogyma order, belonging to the pentandria class of plants; and in the natural method ranking under the 30th order, *Contorta*. It has two many-seeded berries.

CARITAS.—The *poculum caritatis*, or grace-cup, was an extraordinary allowance of wine or other liquors, wherein the religious at festivals drank in commemoration of their founder and benefactors.

CARISBROOK-CASTLE, a castle situated in the middle of the isle of Wight, where king Charles I. was imprisoned. W. Long. 1. 30. N. Lat. 50. 40.

CARISTO, an episcopal city of Greece, in the eastern part of the island of Negropont, near Cape Loro. E. Long. 24. 15. N. Lat. 38. 6.

CARKE, denotes the 30th part of a SARPLAR of wool.

CARLE. See CHURL.

CARLETON (Sir Dudley), was born in Oxfordshire, 1573, and bred in Christ-church college. He went as secretary to Sir Ralph Winwood into the Low Countries, when king James resigned the cautionary towns to the States; and was afterwards employed for 20 years as ambassador to Venice, Savoy, and the United Provinces. King Charles created him viscount Dorchester, and appointed him one of his principal secretaries of state; in which office he died in 1631. He was esteemed a good statesman, though an honest man; and published several political works.

CARLINA, the CARLINE THISTLE: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The calyx is radiated with long coloured marginal scales. There are seven species, only one of which is a native of Britain, viz. the vulgaris. The others are natives of the south of France or Italy; and are very easily propagated in this country by seeds, which must be sown on a bed of fresh undunged earth, where they are to remain, as they do not bear transplanting. When the plants appear above ground, they should be carefully weeded, and afterwards thinned, leaving them about ten inches or a foot asunder. The second year most of them will flower: but, unless the season proves dry, they rarely produce good seeds in this country, and some of the plants decay soon after they have flowered, so that it is pretty difficult to maintain them here. The roots are used in medicine, and for that purpose are imported from those countries where the plants grow naturally. As we receive them, they are about an inch thick, externally of a rusty brown colour, corroded as it were on the surface, and perforated with numerous small holes, appearing on the surface as if worm-eaten. They have a strong smell, and a sub-acrid, bitterish, weakly, aromatic taste. They are looked upon to be warm alexipharmics and diaphoretics. Frederic Hoffman the Elder relates that he has observed a decoction of them in broth to occasion vomiting. They have been for some time greatly esteemed among foreign physicians; but never were much in use in this country. The present practice has entirely rejected them, nor are they often to be met with in the shops.

CARLINE, or CAROLINE THISTLE. See CARLINA. It is said to have been discovered by an angel to Charlemagne, to cure his army of the plague; whence its denomination.

CARLINE, or *Caroline*, a silver coin current in the Neapolitan dominions, and worth about 4d. of our money.

CARLINES, or CARLINGS, in a ship, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel; serving as a foundation for the whole body of the ship. On these the ledges rest, whereon the planks of the deck and other matters of carpentry are made fast. The carlines have their ends let into the beams called *culver-tail-wise*.

CARLINE-Knees, are timbers going athwart the ship, from

Carke

Carline.

Carlingford from the fides to the hatch-way, serving to sustain the deck on both fides.

CARLINGFORD, a port-town of Ireland, seated on Carlingford bay, in the county of Louht, and province of Leinster, 22 miles north of Drogheda. W. Long. 6. 24. N. Lat. 24. 5.

CARLISLE, the capital city of the county of Cumberland, seated on the south of the river Eden, and between the Petterel on the east, and the Caude on the west. It is surrounded by a strong stone-wall, and has a pretty large castle in the western part of it, as also a citadel in the eastern part, built by Henry VIII. It flourished in the time of the Romans, as appears from the antiquities that are to be met with here, and the Roman coins that have been dug up. At the departure of the Romans this city was ruined by the Scots and Picts; and was not rebuilt till the year 680, by Egfrid, who encompassed it with a wall, and repaired the church. In the 8th and 9th centuries, the whole country was again ruined, and the city laid desolate by the incursions of the Norwegians and Danes. In this condition it remained till the time of William Rufus; who repaired the walls and the castle, and caused the houses to be rebuilt. It was fortified by Henry I. as a barrier against Scotland; he also placed a garrison in it, and made it an episcopal see. It was twice taken by the Scots, and afterwards burnt accidentally in the reign of Richard II. The cathedral, the suburbs, and 1500 houses, were destroyed at that time. It is at present in a good condition; and has three gates, the English on the south, the Scotch on the north, and Irish on the west. It has two parishes, and as many churches, St Cuthbert and St Mary's, the last of which is the cathedral, and is separated from the town by a wall of its own. The eastern part, which is the newest, is a curious piece of workmanship. The choir with the aisles is 71 feet broad; and has a stately east window 48 feet high and 30 broad, adorned with curious pillars. The roof is elegantly vaulted with wood; and is embellished with the arms of England and France quartered; as also with Piercy's, Lucy's, Warren's, Mowbray's, and many others. In the choir are the monuments of three bishops who are buried there. The see was erected in 1133 by king Henry I. and made suffragan to the archbishop of York. The cathedral church here had been founded a short time before by Walter, deputy in these parts for king William Rufus, and by him dedicated to the Virgin Mary. He likewise built a monastery, and filled it with canons regular of St Augustine. This foundation continued till the dissolution of monasteries, when its lands were added to the see, and the maintenance of a dean, &c. placed here in their room. The church was almost ruined by the usurper Cromwell and his soldiers; and has never since recovered its former beauty, although repaired after the restoration. This diocese contains the greatest part of the counties of Cumberland and Westmoreland, in which are only 93 parishes; but these (as all the northern are) exceeding large; and of them 18 are impropriations. Here is one archdeacon, viz. of Carlisle. The see is valued in the king's books at L. 530 : 4 : 11½, but is computed to be worth annually L. 2800. The clergy's tenth amounts only to L. 161 : 1 : 7½. To this cathedral belong a bishop, a dean, a chancellor, an archdeacon, four prebendaries,

eight minor canons, &c. and other inferior officers and servants.

The Picts wall, which was built across the country from Newcastle, terminates near this place. Carlisle was a fortified place, and still has its governor and lieutenant-governor, but no garrison. It was taken by the rebels, Nov. 15. 1745; and was retaken by the duke of Cumberland on the 10th of December following, and deprived of its gates. It is governed by a mayor, twelve aldermen, two bailiffs, &c. and has a considerable market on Saturdays. The manufactures of Carlisle are chiefly of printed linens, for which near 3000 l. per annum is paid in duties. It is also noted for a great manufacture of whips, in which a great number of children are employed. — Salmon appear in the Eden in numbers, so early as the months of December and January; and the London and even Newcastle markets are supplied with early fish from this river: but it is remarkable, that they do not visit the Esk in any quantity till April; notwithstanding the mouths of the two rivers are at a small distance from each other. — Carlisle sends two members to parliament, and gives title of Earl to a branch of the Howard family.

CARLOCK, in commerce, a sort of isinglass, made with the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but it is also used by the dyers. The best carlock comes from Astracan, where a great quantity of sturgeon is caught.

CARLOSTAD, or **CARLSTAD**, a town of Sweden in Wermeland, seated on the lake Warmer, in E. Long. 14. 4. N. Lat. 59. 16.

CARLOSTAD, or *Carlsstadt*, a town of Hungary, capital of Croatia, and the usual residence of the governors of the province. It is seated on the river Kulph, in E. Long. 16. 5. N. Lat. 45. 34.

CARLOWITZ, a small town of Hungary, in Sclavonia, remarkable for a peace concluded here between the Turks and Christians in 1669. It is seated on the west side of the Danube, in E. Long. 19. 5. N. Lat. 45. 25.

CARLSCRONA, or **CARLSCROON**, a sea-port town in the Baltic, belonging to Sweden. It derives its origin and name from Charles XI. who first laid the foundations of a new town in 1680, and removed the fleet from Stockholm to this place, on account of its advantageous situation in the centre of the Swedish seas, and the superior security of its harbour. The greatest part of Carlscrona stands upon a small rocky island, which rises gently in a bay of the Baltic; the suburbs extend over another small rock, and along the mole close to the basin where the fleet is moored. The way into the town from the main land is carried over a dyke to an island, and from thence along two long wooden bridges joined by a barren rock. The town is spacious, and contains about 18,000 inhabitants. It is adorned with one or two handsome churches, and a few tolerable houses of brick; but the generality of buildings are of wood. The suburbs are fortified towards the land by a stone-wall. The entrance into the harbour, which by nature is extremely difficult from a number of shoals and rocky islands, is still further secured from the attack of an enemy's fleet by two strong forts built on two islands, under the batteries of which all vessels must pass.

Formerly vessels in this port, when careened and repaired, were laid upon their sides in the open harbour, until a dock, according to a plan given by Polheim, was hollowed in the solid rock: it was begun in 1714, and finished in 1724; but as it was too small for the admission of men of war, it has lately been enlarged, and is now capable of receiving a ship of the first rate. But new docks have been begun upon a stupendous plan worthy of the ancient Romans. According to the original scheme, it was intended to construct 30 docks, for building and laying up the largest ships, at the extremity of the harbour. A large basin, capable of admitting two men of war, is designed to communicate, by sluices, with two smaller basins, from each of which are to extend, like the radii of a circle, five rows of covered docks: each row is to be separated by walls of stone; and each dock to be provided with sluice-gates, so as to be filled or emptied by means of pumps. Close to the docks, magazines for naval stores are to be constructed, and the whole to be inclosed with a stone-wall. The project was begun in 1757; but was much neglected until the accession of his present majesty, who warmly patronized the arduous undertaking. At the commencement of the works, L. 25,000 were annually expended upon them; which sum has been lessened to about L. 6000 per annum, and the number of docks reduced to 20. The first dock was finished in 1779, and it was computed that the whole number would be executed in 20 years.

CARLSTADT, a town of Germany, in the circle of Franconia, and bishopric of Wurtzburg, seated on the river Maine, in E. Long. 9. 51. N. Lat. 50. 0.

CARLTON, a town in Norfolk held by this tenure, that they shall present 1000 herrings baked in 14 pies to the king, wherever he shall be when they first come in season.

CARMAGNIOLA, a fortified town of Italy, in Piedmont, with a good castle. It was taken by the French in 1691, and retaken by prince Eugene the same year. It is seated in a country abounding in corn, flax, and silk, near the river Po, in E. Long. 7. 32. N. Lat. 44. 43.

CARMANIA (anc. geog.), a country of Asia, to the east of Persia, having Parthia to the north, Gedrosia to the east, to the south the Persian Gulf or Sea in part, and in part the Indian, called the *Carmanian Sea*, distinguished into *Carmania Deserta*, and *Carmania Propria*; the former lying to the south of Parthia; and to the south of that, the *Propria*, quite to the sea. Its name is from the Syriac, *Carma*, signifying a "vine," for which that country was famous, yielding clusters three feet long. Now KERMAN, or CARIMANIA, a province of modern Persia.

CARMEL, a high mountain of Palestine, standing on the skirts of the sea, and forming the most remarkable head-land on all that coast. It extends eastward from the sea as far as the plain of Jezreel, and from the city of that name quite to Cæsarea on the south. It seems to have had the name of *Carmel* from its great fertility; this word, according to the Hebrew import, signifying the *vine of God*, and is used in scripture to denote any fruitful spot, or any place planted with fruit trees. This mountain, we are assured, was very fertile. Mr Sandys acquaints us, that,

when well cultivated, it abounds with olives, vines, and variety of fruits and herbs both medicinal and aromatic. Others, however, represent it as rather dry and barren; which perhaps may have happened from the neglect of agriculture so common in all parts of the Turkish empire, especially where they are exposed to the incursions of the Arabs. Carmel is the name of the mountain, and of a city built on it; as well as of a heathen deity worshipped in it, but without either temple or statue: though anciently there must have been a temple, as we are told that this mountain was a favourite retreat of Pythagoras, who spent a good deal of time in the temple, without any person with him. But what hath rendered mount Carmel most celebrated and revered both by Jews and Christians, is its having been the residence of the prophet Elijah, who is supposed to have lived there in a cave (which is there shown), before he was taken up into heaven.

CARMELITES, an order of religious, making one of the four tribes of mendicants or begging friars; and taking its name from mount Carmel, formerly inhabited by Elias, Elisha, and the children of the prophets; from whom this order pretends to descend in an uninterrupted succession. The manner in which they make out their antiquity has something in it too ridiculous to be rehearsed. Some among them pretend they are descendants of Jesus Christ; others go further, and make Pythagoras a Carmelite, and the ancient druids regular branches of their order. Phocas, a Greek monk, speaks the most reasonably. He says, that in his time, 1185, Elias's cave was still extant on the mountain; near which were the remains of a building which intimated that there had been anciently a monastery; that, some years before, an old monk, a priest of Calabria, by revelation, as he pretended, from the prophet Elias, fixed there, and assembled ten brothers.—In 1209, Albert, patriarch of Jerusalem, gave the solitaries a rigid rule, which Papebroch has since printed. In 1217, or, according to others, 1226, pope Honorius III. approved and confirmed it. This rule contained 16 articles; one of which confined them to their cells, and enjoined them to continue day and night in prayer; another prohibited the brethren having any property; another enjoined fasting from the feast of the holy cross till Easter, except on Sundays; abstinence at all times from flesh was enjoined by another article; one obliged them to manual labour; another imposed a strict silence on them from vespers till the tierce the next day.

The peace concluded by the emperor Frederic II. with the Saracens, in the year 1229, so disadvantageous to Christendom, and so beneficial to the infidels, occasioned the Carmelites to quit the Holy Land, under Alan the fifth general of the order. He first sent some of the religious to Cyprus, who landed there in the year 1238, and founded a monastery in the forest of Fortania. Some Sicilians, at the same time, leaving mount Carmel, returned to their own country, where they founded a monastery in the suburbs of Messina. Some English departed out of Syria, in the year 1240, to found others in England. Others of Provence, in the year 1244, founded a monastery in the desert of Aigualates, a league from Marseilles: and thus, the number of their monasteries increasing, they held their European general chapter in the year 1245, at their monastery.

Carmelites
||
Carminatives.

naftery of Aylesford in England.—This order is so much increased, that it has, at present, 38 provinces, besides the congregation of Mantua, in which are 54 monasteries, under a vicar-general; and the congregations of Barefooted Carmelites in Italy and Spain, which have their peculiar generals.

After the establishment of the Carmelites in Europe, their rule was in some respects altered; the first time, by pope Innocent IV. who added to the first article a precept of chastity, and relaxed the 11th which enjoins abstinence at all times from flesh, permitting them, when they travelled, to eat boiled flesh: this pope likewise gave them leave to eat in a common refectory, and to keep asses or mules for their use. Their rule was again mitigated by the popes Eugenius IV. and Pius II. Hence the order is divided into two branches, viz. *the Carmelites of the ancient observance*, called the *moderate* or *mitigated*; and those of the *strict observance*, who are the *barefooted Carmelites*; a reform set on foot in 1540, by S. Theresa, a nun of the convent of Avila, in Castile: these last are divided into two congregations, that of Spain and that of Italy.

The habit of the Carmelites was at first white, and the cloak laced at the bottom with several lists. But pope Honorius IV. commanded them to change it for that of the Minims. Their scapulary is a small woollen habit of a brown colour, thrown over their shoulders. They wear no linen shirts; but instead of them linsley-wolfey, which they change twice a-week in the summer, and once a-week in the winter.

If a monk of this order lies with a woman, he is prohibited saying mass for three or four years, is declared infamous, and obliged to discipline himself publicly once a-week. If he is again guilty of the same fault, his penance is doubled; and if a third time, he is expelled the order.

CARMEN, an ancient term among the Latins, used in a general sense to signify a verse; but more particularly to signify a spell, charm, form of expiation or exorcism, couched in a few words placed in a mystic order, on which its efficacy depended. Pezron derives the word *carmen* from the Celtic *carm*, the shout of joy, or the verses which the ancient bards sung to encourage the soldiers before the combat.—*Carmen* was anciently a denomination given also to precepts, laws, prayers, imprecations, and all solemn formulæ couched in a few words placed in a certain order, though written in prose. In which sense it was that the elder Cato wrote a *Carmen de moribus*, which was not in verse, but in prose.

CARMENTALIA, a feast among the ancient Romans, celebrated annually upon the 11th of January, in honour of Carmenta, or Carmentis, a prophetess of Arcadia, mother of Evander, with whom she came into Italy 60 years before the Trojan war. The solemnity was also repeated on the 15th of January, which is marked in the old calendar by *Carmentalia relata*. This feast was established on occasion of a great fecundity among the Roman dames, after a general reconciliation with their husbands, with whom they had been at variance, in regard of the use of coaches being prohibited them by an edict of the senate. This feast was celebrated by the women: he who offered the sacrifices was called *sacerdos carmentalis*.

CARMINATIVES, medicines used in colics, or other flatulent disorders, to dispel the wind.

The word comes from the Latin *carminare*, to card or tease wool, and figuratively to attenuate and disperse wind or vapours, and promote their discharge by perspiration. Though Dr Quincy makes it more mysterious: He says it comes from the word *carmen*, taking it in the sense of an invocation or charm; and makes it to have been a general name for all medicines which operated like charms, i. e. in an extraordinary manner. Hence, as the most violent pains were frequently those arising from pent-up wind, which immediately cease upon dispersion; the term *carminative* became in a peculiar sense applied to medicines which gave relief in windy cases, as if they cured by enchantment: but this interpretation seems a little too far strained.

CARMINE, a powder of a very beautiful red colour, bordering upon purple; and used by painters in miniature, though rarely on account of its great price. The manner of preparing it is kept a secret by the colour-makers; neither do any of those receipts which have for a long time been published concerning the preparation of this and other colours at all answer the purpose. See *COLOUR-Making*.

CARMONA, a town of Italy in Frioli, and in the county of Goritz, seated on a mountain near the river Indri. It belongs to the house of Austria. E. Long. 5. 37. N. Lat. 46. 15.

CARMONA, an ancient town of Spain in Andalusia. The gate towards Seville is one of the most extraordinary pieces of antiquity in all Spain. It is seated in a fertile country, 15 miles east of Seville. W. Long. 5. 37. N. Lat. 37. 24.

CARNATION, in botany. See *DIANTHUS*.

CARNATION-Colour, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery. Titian and Corregio in Italy, and Rubens and Vandyke in Flanders, excelled in carnations.—In colouring for flesh, there is so great a variety, that it is hard to lay down any general rules for instruction therein; neither are there any regarded by those who have acquired a skill this way: the various colouring for carnations may be easily produced, by taking more or less red, blue, yellow, or bistre, whether for the first colouring, or for the finishing: the colour for women should be bluish, for children a little red, both fresh and gay; and for the men it should incline to yellow, especially if they are old.

CARNATION, among dyers. To dye a carnation, or red rose colour, it is directed to take liquor of wheat bran a sufficient quantity, alum three pounds, tartar two ounces; boil them and enter twenty yards of broad cloth; after it has boiled three hours, cool and wash it: take fresh clear bran liquor a sufficient quantity, madder five pounds; boil and sodden according to art.—The Bow dyers know that the solution of jupiter, or delved tin, being put in a kettle to the alum and tartar, in another process, makes the cloth, &c. attract the colour into it, so that none of the cochineal is left, but the whole is absorbed by the cloth.

CARNEADES, a celebrated Greek philosopher, was a native of Cyrene in Africa, and founder of the third academy. He was so fond of study, that he not only avoided all entertainments, but forgot even to eat at his own table; his maid-servant Melissa was obliged to put the victuals into his hand. He was an antagonist of the Stoics; and applied himself with great eagerness

Carneades.

Carneades
||
Carneia.

gerness to refute the works of Chrysippus, one of the most celebrated philosophers of their sect. The power of his eloquence was dreaded even by a Roman senate. The Athenians being condemned by the Romans to pay a fine of 500 talents for plundering the city of Oropus, sent ambassadors to Rome, who got the fine mitigated to 100 talents. Carneades the academic, Diogenes the Stoic, and Critolaus the Peripatetic, were charged with this embassy. Before they had an audience of the senate, they harangued to great multitudes in different parts of the city. Carneades's eloquence was distinguished from that of the others by its strength and rapidity. Cato the elder made a motion in the senate, that these ambassadors should be immediately sent back, because it was very difficult to discern the truth thro' the arguments of Carneades. The Athenian ambassadors (said many of the senators) were sent rather to force us to comply with their demands, than to solicit them by persuasion; meaning, that it was impossible to resist the power of that eloquence with which Carneades addressed himself to them. According to Plutarch, the youth at Rome were so charmed by the fine orations of this philosopher, that they forsook their exercises and other diversions, and were carried with a kind of madness to philosophy; the humour of philosophizing spreading like enthusiasm. This grieved Cato, who was particularly afraid of the subtilty of wit and strength of argument with which Carneades maintained either side of a question. Carneades harangued in favour of justice one day, and the next day against it, to the admiration of all who heard him, among whom were Galba and Cato, the greatest orators of Rome. This was his element; he delighted in demolishing his own work; because it served in the end to confirm his grand principle, that there are only probabilities or resemblances of truth in the mind of man; so that of two things directly opposite, either may be chosen indifferently. Quintilian remarks, that though Carneades argued in favour of injustice, yet he himself acted according to the strict rules of justice. The following was a maxim of Carneades: "If a man privately knew that his enemy, or any other person whose death might be of advantage to him, would come to sit down on grass in which there lurked an asp, he ought to give him notice of it, though it were in the power of no person whatever to blame him for being silent." Carneades, according to some, lived to be 85 years old; others make him to be 90: his death is placed in the 4th year of the 162d Olympiad.

CARNEDDE, in British antiquity, denote heaps of stones supposed to be druidical remains, and thrown together on occasion of confirming and commemorating a covenant. Gen. xxxi. 46. They are very common in the isle of Anglesey, and were also used as sepulchral monuments, in the manner of *tumuli*; for Mr Rowland found a curious urn in one of these carnedde. Whence it may be inferred, that the Britons had the custom of throwing stones on the deceased. From this custom is derived the Welch proverb, *Karn ardyben*, "ill betide thee."

CARNEIA, in antiquity, a festival in honour of Apollo, surnamed Carneus, held in most cities of Greece, but especially at Sparta, where it was first instituted.

The reason of the name, as well as the occasion of

the institution, is controverted. It lasted nine days, beginning on the 13th of the month Carneus. The ceremonies were an imitation of the method of living and discipline used in camps.

CARNEL.—The building of ships first with their timber and beams, and after bringing on their planks, is called *carne-work*, to distinguish it from clinch-work.

Vessels also which go with mizzen-sails instead of main-sails are by some called carnels.

CARNELIAN, in natural history, a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white. The red is very well known among us; is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch and two or three inches in diameter: it is of a fine, compact, and close texture; of a glossy surface; and, in the several specimens, is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds, or variegations: but sometimes it is veined very beautifully with an extremely pale red, or with white; the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian which are all of one colour, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish: it is not at all affected by acid menstruums: the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long continued heat will reduce it to a pale dirty gray.

The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and we have some not despicable ones in England.

Though the ancients have recommended the carnelian as astringent, and attributed a number of fanciful virtues to it, we know of no other use of the stone than the cutting seals on it; to which purpose it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and to separate easily from the wax.

CARNERO, in geography, a name given to that part of the gulph of Venice which extends from the western coast of Istria to the island of Grossa and the coast of Morlachia.

CARNERO is likewise the name of the cape to the west of the mouth of the bay of Gibraltar.

CARNIFEX, among the Romans, the common executioner. By reason of the odiousness of his office, the carnifex was expressly prohibited by the laws from having his dwelling-house within the city. In middle age writers carnifex also denotes a butcher.

Under the Anglo-Danish kings, the carnifex was an officer of great dignity; being ranked with the archbishop of York, earl Goodwin, and the lord steward. Flor. Wigorn. ann. 1040. *Rex Hardecanutus Alfricum Ebor. Archiep. Goodwinum comitem, Edricum dispensatorem, Thronum suum carnificem, & alios magnæ dignitatis viros Londinum misit.*

CARNIOLA, a duchy of Germany bounded on the south by the Adriatic sea, and that part of Istria possessed

Carnel
||
Carniola.

Carniola,
Carnival.

possessed by the republic of Venice; on the north, by Carinthia and Stiria; on the east, by Slavonia and Croatia; on the west, by Friuli, the county of Gorz or Goritz, and a part of the gulph of Venice; extending in length about 110 miles, and in breadth about 50. It had its ancient name *Carnia*, as well as the modern one *Carniola*, from its ancient inhabitants the *Carni*, a tribe of Scythians, otherwise called *Japides*, whence this and the adjacent countries were also called *Japidia*.

Carniola is full of mountains, some of which are cultivated and inhabited, some covered with wood, others naked and barren, and others continually buried in snow. The valleys are very fruitful. Here are likewise mines of iron, lead, and copper; but salt must be had from the sovereign's magazines. There are several rivers, besides many medicinal springs and inland lakes. The common people are very hardy, going barefooted in winter through the snow, with open breasts, and sleeping on a hard bench without bed or bolster. Their food is also very coarse and mean. In winter, when the snow lies deep on the ground, the mountaineers bind either small baskets, or long thin narrow boards, like the Laplanders, to their feet, on which, with the help of a stout staff or pole, they descend with great velocity from the mountains. When the snow is frozen, they make use of a sort of irons or skaits. In different parts of the country the inhabitants, especially the common sort, differ greatly in their dress, language, and manner of living. In Upper and Lower Carniola they wear long beards. The languages chiefly in use are the Slavonian or Wendish, and German; the first by the commonalty, and the latter by people of fashion. The duchy is divided into the Upper, Lower, Middle, and Inner, Carniola. The principal commodities exported hence are, iron, steel, lead, quicksilver, white and red wine, oil of olives, cattle, sheep, cheese, linen, and a kind of woollen stuff called *mahalan*, Spanish leather, honey, walnuts, and timber; together with all manner of wood-work, as boxes, dishes, &c.—Christianity was first planted here in the eighth century.—Lutheranism made a considerable progress in it; but, excepting the Walachians or Uskokes, who are of the Greek church, and style themselves *Staraverzi*, i. e. old believers, all the inhabitants at present are Roman Catholics. Carniola was long a marquissate or margravate; but in the year 1231 was erected into a duchy. As its proportion towards the maintenance of the army, it pays annually 363,171 florins; but only two regiments of foot are quartered in it.

CARNIVAL, or **CARNAVAL**, a time of rejoicing, a season of mirth, observed with great solemnity by the Italians, particularly at Venice, holding from the twelfth day till Lent.

The word is formed from the Italian *Carnavalle*; which Mr Du Cange derives from *Carn-a-val*, by reason the flesh then goes to pot, to make amends for the season of abstinence then ensuing. Accordingly, in the corrupt Latin, he observes, it was called *Carnelevamen*, and *Carnisprivium*; as the Spaniards still denominate it *carnes tollendas*.

Festivals, balls, operas, concerts of music, intrigues, marriages, &c. are chiefly held in carnival time. The carnival begins at Venice the second holiday in Christmas: Then it is they begin to wear masks, and open

their play-houses and gaming houses; the place of St Mark is filled with mountebanks, jack-puddings, pedlars, whores, and such like mob, who flock thither from all parts. There have been no less than seven sovereign princes and 30,000 foreigners here to partake of these diversions.

CARNIVOROUS, an epithet applied to those animals which naturally seek and feed on flesh.

It has been a dispute among naturalists, whether man is naturally carnivorous. Those who take the negative side of the question, insist chiefly on the structure of our teeth, which are mostly incisores or molares; not such as *carnivorous* animals are furnished with, and which are proper to tear flesh in pieces: to which it may be added, that, even when we do feed on flesh, it is not without a preparatory alteration by boiling, roasting, &c. and even then that it is the hardest of digestion of all foods. To these arguments Dr Wallis subjoins another, which is that all quadrupeds which feed on herbs or plants have a long colon, with a cœcum at the upper end of it, or somewhat equivalent, which conveys the food by a long and large progress, from the stomach downwards, in order to its slower passage and longer stay in the intestines; but that, in *carnivorous* animals, such cœcum is wanting, and instead thereof there is a more short and slender gut, and a quicker passage through the intestines. Now, in man, the cœcum is very visible: a strong presumption that nature, who is still consistent with herself, did not intend him for a *carnivorous* animal.—It is true, the cœcum is but small in adults, and seems of little or no use; but in a fœtus it is much larger in proportion: And it is probable, our customary change of diet, as we grow up, may occasion this shrinking. But to these arguments, Dr Tyson replies, that if man had been by nature designed not to be *carnivorous*, there would doubtless have been found, somewhere on the globe, people who do not feed on flesh; which is not the case. Neither are carnivorous animals always without a colon and cœcum; nor are all animals carnivorous which have those parts: the opossum, for instance, hath both a colon and cœcum, and yet feeds on poultry and other flesh; whereas the hedge-hog, which has neither colon nor cœcum, and so ought to be carnivorous, feeds only on vegetables. Add to this, that hogs, which have both, will feed upon flesh when they can get it; and rats and mice, which have large cœcums, will feed on bacon as well as bread and cheese. Lastly, the human race are furnished with teeth necessary for the preparation of all kinds of foods; from whence it would seem, that nature intended we should live on all. And as the alimentary duct in the human body is fitted for digesting all kinds of food, ought we not rather to conclude, that nature did not intend to deny us any?

It is no less disputed whether mankind were *carnivorous* before the flood. St Jerom, Chrysostom, Theodoret, and other ancients, maintain, that all animal food was then forbidden; which opinion is also strenuously supported among the moderns by Curcellæus, and refuted by Heidegger, Danzius, Bockhart, &c. See **ANTEDILUVIANS**.

CARNOSITY is used by some authors for a little fleshy

Carnivo-
rous,
Carnosity.

Caro,
Carolina.

fleshy excrescence, tubercle, or wen, formed in the urethra, the neck of the bladder, or yard, which stops the passage of the urine.—Carnosities are very difficult of cure: they are not easily known but by introducing a probe into the passage, which there meets with resistance. They usually arise from some venereal malady ill managed.

CARO (Annibal), a celebrated Italian poet, was born at Civita Nuovo in 1507. He became secretary to the Duke of Parma, and afterwards to Cardinal Farnese. He was also made a knight of Malta. He translated Virgil's *Æneid* into his own language with such propriety and elegance of expression, that he was allowed by the best judges to have equalled the original. He also translated Aristotle's rhetoric, two oratorios of Gregory Nazianzen, with a discourse of Cyprian. He wrote a comedy; and a miscellany of his poems was printed at Venice in 1584. He died at Rome in 1566.

CAROLINA, a province of North America, comprehending the most westerly part of Florida, and lying between 29 and 36 degrees of N. Lat. It is bounded on the east by the Atlantic, and on the west by the river Mississippi, on the north by Virginia, on the south by Georgia, and to the south of Georgia by the Floridas.

This country is seated between the extremities of heat and cold, though the heat is more troublesome in summer than the cold in winter; their winters being very short, and the frosty mornings frequently succeeded by warm days. The air is generally serene and clear the greatest part of the year; but in February and March the inhabitants have a custom of burning the woods, which causes such a smoke as to strangers would seem to proceed from a fog or thickens in the air. The smoke of the tar-kilns likewise deceives strangers, and gives them an ill opinion of the air of Carolina; to which also conduces a custom of the Indians of setting fire to the woods in their huntings, for many miles round. The great rains are in winter, though they are not without heavy showers at midsummer; add to these the constant dews that fall in the night, which refresh the ground and supply the plants with moisture. In North Carolina, the north-west winds in the winter occasion very pinching weather; but they are not of long continuance. Westerly winds bring very pleasant weather; but the southerly are hot and unwholesome, occasioning fevers and other disorders. But this must be understood of summer, for in winter they are very comfortable. The depth of winter is towards the latter end of February, and then the ice is not strong enough to bear a man's weight. In August and September there are sometimes great storms and squalls of wind, which are so violent as to make lanes of 100 feet wide, more or less, thro' the woods, tearing up the trees by the roots. These storms generally happen once in about seven years; and are attended with dreadful thunder, lightning, and heavy rains. They commonly happen about the time of the hurricanes which rage so fatally among the islands between the tropics; and seem to be occasioned by them, or to proceed from the same cause: but by the time they reach Carolina, their force is much abated; and the farther north they proceed, so much the more do they decrease in fury. The soil on the coast

VOL. IV. Part I.

is sandy; but farther up, the country is so fruitful that they have not yet been at the trouble to manure their land. The grains most cultivated are Indian corn and rice, though any sort will thrive well enough; they have also pulse of several sorts, little known in England. All kinds of garden stuff usual in England are cultivated here, and may be had in great plenty. They export large quantities yearly of rice, pitch, tar, turpentine, deer-skins, and timber for building; cypress, cedar, sassafras, oak, walnut, and pine. Besides these they also send out beef, pork, tallow, hides, furs, wheat, peas, potatoes, honey, bees-wax, myrtle-wax, tobacco, snake-root, cotton, several sorts of gums and medicinal drugs. Indigo is also cultivated in this province, but of an inferior quality to that which comes from the Caribbee islands. It hath been attempted in vain to cultivate vines, and produce silk, in this country; for though the frosts here do not continue long without intervals of warmer weather, they are sufficient to check the growth of the vine, as well as olives, dates, oranges, &c. The furs are bought of the Indians with vermilion, lead, gunpowder, coarse cloth, iron, and spirituous liquors. As yet they have not a sufficient number of handicraftsmen; which renders labour very dear, and a supply of clothes from Europe necessary. The aspect of the country is very fine, being adorned with beautiful rivers and creeks, and the woods with lofty timber, which afford delightful and pleasant seats for the planters, and render the fencing their lands very easy. And as they have plenty of fish, wild fowl, and venison, besides other necessaries which this country produces naturally, they live easy and luxuriously.

Their rivers are large, and navigable a great many miles up the country. They rise near the mountains, and abound with delicate fish, besides water-fowl of different kinds. In some there are islands which yield good pasture, without the annoyance of wild beasts. The chief mountains are the Cherokee or Allegany mountains, which are situated north and north-west, five or six hundred miles distant from the sea. They are very high; and abound with trees, plants, stones, and minerals, of different kinds.

This country is divided into North and South Carolina, and Georgia; each of which, before the late revolution, was under a particular governor. The North is subdivided into four counties, Granville, Colleton, Berkley, and Craven; and South Carolina into two, Clarendon and Albemarle. This last is also divided into 14 parishes or townships, each of which has a brick or timber church. The former likewise has the same number of parishes. Charlestown is the capital of the whole country.

Carolina was discovered by Sebastian Cabot, about the year 1500, in the reign of Henry VII. but the settling of it being neglected by the English, a colony of French Protestants, by the encouragement of Admiral Coligni, were transported thither; and named the place of their first settlement *Arx Carolina*, in honour of their prince, Charles IX. of France: but in a short time that colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till the year 1664, when 800 English landed at Cape-Fear in North Carolina, and took possession of the country. In 1670 Cha. II.

Z

of

Carolina.

Un. Hist.
xxvi. 88.

Carolina. of Britain granted Carolina to the Lords Berkley, Clarendon, Albemarle, Craven, and Ashley, Sir George Carteret, Sir William Berkley, and Sir John Colliton. The plan of government for this new colony was drawn up by the famous Mr Locke, who very wisely proposed an universal toleration in religious matters. The only restriction in this respect was, that every person claiming the protection of that settlement, should, at the age of 17, register himself in some particular communion. To civil liberty, however, our philosopher was not so favourable; the code of Carolina gave to the eight proprietors who founded the colony, and to their heirs, not only all the rights of a monarch, but all the powers of a legislation. The court, which was composed of this sovereign body, and called the *Palatine Court*, was invested with the right of nominating to all employments and dignities, and even of conferring nobility; but with new and unprecedented titles. They were, for instance, to create in each county two *caciques*, each of whom was to be possessed of 24,000 acres of land; and a *landgrave*, who was to have 80,000. The persons on whom these honours should be bestowed were to compose the upper house, and their possessions were made unalienable. They had only the right of farming or letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about a shilling per acre, and even this rent was redeemable. All the inhabitants, however, both slaves and freemen, were under an obligation to take up arms upon the first order from the Palatine court.

It was not long before the defects of this constitution became apparent. The proprietary lords used every endeavour to establish an arbitrary government; and, on the other hand, the colonists exerted themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its particular advantages of situation. Though a toleration in religious matters was a part of the original constitution, dissensions arose likewise on that account. In 1705, Carteret, now Lord Granville, who, as the oldest of the proprietors, was sole governor of the colony, formed a design of obliging all the non-conformists to embrace the ceremonies of the Church of England; and this act of violence, though disavowed and rejected by the mother-country, inflamed the minds of the people. In 1720, while this animosity was still subsisting, the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword: but, in 1728, the lords proprietors having refused to contribute towards the expences of an expedition, of which they were to share the immediate benefits, were deprived of their prerogative, except Lord Granville, who still retained his eighth part. The rest received a recompence of about 24,000*l*. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The division into North and South Carolina now took place,

and the settlement of Georgia commenced in 1732. **Caroline** See GEORGIA.

CAROLINE, See CARLINE.

CAROLINE-Books, the name of four books, composed by order of Charlemagne, to refute the second council of Nice. These books are couched in very harsh and severe terms, containing 120 heads of accusation against the council of Nice, and condemning the worship of images.

CARLOSTADIANS, or **CARLOSTADIANS**, an ancient sect or branch of Lutherans, who denied the real presence of Christ in the eucharist.

They were thus denominated from their leader Andrew Carolostadius, who having originally been archdeacon of Wittemberg, was converted by Luther, and was the first of all the reformed clergy who took a wife; but disagreeing afterwards with Luther, chiefly in the point of the sacrament, founded a sect apart. The Carolostadians are the same with what are otherwise denominated Sacramentarians, and agree in most things with the Zuinglians.

CAROLUS, an ancient English broad piece of gold struck under Charles I. Its value has of late been at 23 shillings Sterling, though at the time it was coined it is said to have been rated at 20 shillings.

CAROLUS, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France. The carolus was worth 12 deniers when it ceased to be current. Those which are still current in trade in Lorrain, or in some neighbouring provinces, go under the name of French sols.

CAROTIDS, in anatomy, two arteries of the neck, which convey the blood from the aorta to the brain; one called the right, and the other the left, carotid.

CARP, in ichthyology, the English name of a species of cyprinus. See CYPRINUS; also *CARP-FISHING*.

The carp is the most valuable of all kinds of fish for stocking of ponds. It is very quick in its growth, and brings forth the spawn three times a-year, so that the increase is very great. The female does not begin to breed till eight or nine years old; so that in breeding-ponds a supply must be kept of carp of that age. The best judges allow, that, in stocking a breeding-pond, four males should be allowed to twelve females. The usual growth of a carp is two or three inches in length in a year; but, in ponds which receive the fattening of common sewers, they have been known to grow from five inches to 18 in one year. A feeding-pond of one acre extent will very well feed 300 carp of three years old, 300 of two years, and 400 of one year old. Carp delight greatly in ponds that have marley sides; they love also clay-ponds well sheltered from the winds, and grown with weeds and long grass at the edges, which they feed on in the hot months. Carp and tench thrive very fast in ponds and rivers near the sea, where the water is a little brackish; but they are not so well tasted as those which live in fresh water. Grains, blood, chicken-guts, and the like, may at times be thrown into carp-ponds, to help to fatten the fish. To make them grow large and fat, the growth of grass under the water should by all means possible be encouraged. For this purpose, as the water decreases in the summer, the sides of the pond left naked and dry should be well raked with an iron rake, to destroy

Carpates || **Carpentry** destroy all the weeds, and cut up the surface of the earth: hay-seed should then be sown plentifully in these places; and more ground prepared in the same manner, as the water falls more and more away. By this means there will be a fine and plentiful growth of young grass along the sides of the pond to the water's edge; and when the rains fill up the pond again, this will be all buried under the water, and will make a feeding-place for the fish, where they will come early in the morning, and will fatten greatly upon what they find there.

CARPATES, or **ALPES BASTARNICAE**, (anc. geog.) a range of mountains, running out between Poland, Hungary, and Transylvania. Now called the Carpathian Mountains.

CARPATHIUM (MARE, Horace, Ovid); the sea that washes the island Carpathus.

CARPATHUS, an island on the coast of Asia, two hundred stadia in compass, and an hundred in length. Its name is said to be from its situation on the coast of Caria. It lies between Rhodes and Crete, in the sea which, from this island, is called the Carpathian Sea, and has to the north the Ionian, to the south the Egyptian, to the west the Cretan and African seas. It is two hundred furlongs in compass, and a hundred in length. It had anciently, according to Strabo, four cities; according to Scylax only three. Ptolemy mentions but one, which he calls Posidium. This island is now called Scarpanto.

CARPÆA, a kind of dance anciently in use among the Athenians and Magnesians, performed by two persons, the one acting a labourer, the other a robber. The labourer, laying by his arms, goes to ploughing and sowing, still looking warily about him as if afraid of being surprised: the robber at length appears, and the labourer, quitting his plough, betakes himself to his arms, and fights in defence of his oxen. The whole was performed to the sound of flutes, and in cadence. Sometimes the robber was overcome and sometimes the labourer; the victor's reward being the oxen and plough. The design of the exercise was to teach and accustom the peasants to defend themselves against the attacks of ruffians.

CARPENTER, a person who practises **CARPENTRY**. The word is formed from the French *charpentier*, which signifies the same, formed of *charpente*, which denotes timber; or rather from the Latin *carpentarius*, a maker of *carpenta*, or carriages.

CARPENTER of a Ship, an officer appointed to examine and keep in order the frame of a ship, together with her masts, yards, boats, and all other wooden machinery. It is his duty in particular to keep the ship tight; for which purpose he ought frequently to review the decks and sides, and to caulk them when it is necessary. In the time of battle, he is to examine up and down, with all possible attention, in the lower apartments of the ship, to stop any holes that may have been made by shot, with wooden plugs provided of several sizes.

CARPENTRAS, an episcopal town of Provence in France, and capital of Venaissin. It is subject to the pope; and is seated on the river Auson, at the foot of a mountain. E. Long. 5. 6. N. Lat. 44. 4.

CARPENTRY, the art of cutting, framing, and joining large pieces of wood, for the uses of building.

It is one of the arts subservient to architecture, and is divided into house-carpentry and ship-carpentry: the first is employed in raising roofing, flooring of houses, &c. and the second in the building of ships*, barges, &c. The rules in carpentry are much the same with those of JOINERY; the only difference is, that carpentry is used in the larger and coarser work, and joinery in the smaller and curious.

CARPENTUM, in antiquity, a name common to divers sorts of vehicles, answering to coaches as well as waggons, or even carts, among us. The carpentum was originally a kind of car or vehicle in which the Roman ladies were carried; though in after times it was also used in war. Some derive the word from *carro*; others from *Carmenta* the mother of Evander, by a conversion of the *m* into *p*.

CARPET, a sort of covering of stuff, or other materials, wrought with the needle or on a loom, which is part of the furniture of a house, and commonly spread over tables, or laid upon the floor.

Persian and Turkey carpets are those most esteemed; though at Paris there is a manufactory after the manner of Persia, where they make them little inferior, not to say finer than the true Persian carpets. They are velvety, and perfectly imitate the carpets which come from the Levant. There are also carpets of Germany, some of which are made of woollen stuffs, as serges, &c. and called square carpets: others are made of wool also, but wrought with the needle, and pretty often embellished with silk; and, lastly, there are some made of dogs hair. We have likewise carpets made in Britain, which are used either as floor-carpets, or to cover chairs, &c. It is true, we are not arrived at the like perfection in this manufacture with our neighbours the French; but may not this be owing to the want of a like public encouragement?

CARPET-Knights, a denomination given to gown-men and others, of peaceable professions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raised to the dignity of knighthood.

They take the appellation *carpet*, because they usually receive their honours from the king's hands in the court, kneeling on a carpet. By which they are distinguished from knights created in the camp, or field of battle, on account of their military prowess. Carpet-knights possess a medium between those called *truck*, or *dunkill-knights*, who only purchase or merit the honour by their wealth, and *knights-bachelors*, who are created for their services in the war.

CARPI, a principality of Modena in Italy, lying about four leagues from that city. It formerly belonged to the house of Pio; the elder sons of which bore the title of *Princes of St Gregory*. In the beginning of the 14th century *Manfroy* was the first prince of Carpi; but in the 16th, the emperor Cha. V. gave the principality to Alfonso duke of Ferrara. This nobleman, in recompence, gave to Albert Pio, to whom the principality of Carpi belonged of right, the town of Sassuolo and some other lands. Albert was, however, at last obliged to retire to Paris; where, being stripped of all his estates, he died in 1538, with the reputation of being one of the best and bravest men of his age. The family of Pio is yet in being, and continues attached to the French court. Some of

Carpi,
Carpinus.

them have even been raised to the purple, and still make a figure in Europe.

CARPI, a town of Italy in the duchy of Modena, and capital of the last mentioned principality. It has a strong castle, and is situated in E. Long. 11. 12. N. Lat. 44. 45.

CARPI, a town of the Veronese in Italy, memorable for a victory gained by the Imperialists over the French in 1701. It is subject to the Venetians; and is situated on the river Adige, in E. Long. 11. 39. N. Lat. 45. 10.

CARPI (Ugo da), an Italian painter, of no very considerable talents in that art, but remarkable for being the inventor of that species of engraving on wood, distinguished by the name of chiaro-scuro, in imitation of drawing. This is performed by using more blocks than one; and Ugo da Carpi usually had three; the first for the outline and dark shadows, the second for the lighter shadows, and the third for the half tint. In that manner he struck off prints after several designs, and cartons of Raphael; particularly one of the Sybil, a Descent from the Cross, and the History of Simon the Sorcerer. He died in 1500. This art was brought to a still higher degree of perfection by Balthazar Peruzzi of Siena, and Parmigiano, who published several excellent designs in that manner.

CARPI (Girolamo da), history and portrait painter, was born at Ferrara in 1501, and became a disciple of Garofalo. When he quitted that master, he devoted his whole time, thoughts, and attention, to study the works of Correggio, and to copy them with a most critical care and observation; in which labour he spent several years at Parma, Modena, and other cities of Italy, where the best works of that exquisite painter were preserved. He acquired such an excellence in the imitation of Correggio's style, and copying his pictures, that many paintings finished by him were taken for originals, and not only admired, but were eagerly purchased by the connoisseurs of that time. Nor is it improbable that several of the paintings of Girolamo da Carpi pass at this day for the genuine work of Correggio himself. He died in 1556.

CARPINUS, the HORN-BEAM, in botany: A genus of the polyandria order, belonging to the monœcia class of plants; and in the natural method ranking under the 50th order, *Amentaceæ*. The calyx of the male is monophyllous and ciliated; there is no corolla, but 20 stamens. The calyx of the female is monophyllous and ciliated; no corolla; two germens, with two styles on each. The fruit is an egg-shaped nut. There are two species, viz.

1. The betulus, or common hornbeam; a deciduous tree, native of Europe and America. Its leaves are of a darkish green, and about the size of those of the beech, but more pointed and deeply serrated. Its branches are long, flexible, and crooked; yet in their general appearance very much resemble those of the beech: indeed there is so great a likeness between those two trees, especially in the shrubby and underwood state, that it would be difficult to distinguish them at the first glance, were it not for that glossy varnish with which the leaves of the beech are strongly marked. In the days of EVELYN, when topiary work was the gardener's idol, the hornbeam might be considered as deserving of those endearing expressions which that enthusiastic

writer has been pleased to lavish upon it: nevertheless, as an ornamental in modern gardening it stands low; and its present uses are few. As an underwood it affords stakes and edgers, fuel and charcoal. Its timber ranks with that of the beech and the fycamore; and the inner bark is said to be much used in Scandinavia to dye yellow. The only superior excellency of the hornbeam lies in its fitness for skreen fences for sheltering gardens, nurseries, and young plantations from the severities of the winter season. It may be trained to almost any height, and by keeping it trimmed on the sides it becomes thick of branches, and consequently thick of leaves; which being by their nature retained upon the plant after they wither, a hornbeam hedge occasions a degree of shelter nearly equal to that given by a brick wall. Indeed, being less reflective than that expensive skreen, it affords a more uniform temperature of air to the plants which stand near it. In this point of view, too, the hornbeam is useful to be planted promiscuously, or in alternate rows, amongst more tender plants in exposed situations, in the same manner as the birch; to which it has more than one preference: namely, it is warmer in winter,—and Hanbury says, the hornbeam is peculiarly grateful to hares and rabbits; consequently it may prevent their injuring its more valuable neighbours: yet, like Evelyn, he seems to be of opinion that it is disaffected by deer. If this be really the case, the hornbeam may upon many occasions be introduced into deer-parks with singular propriety.

Of this species there are three varieties: The Eastern Hornbeam, Flowering Hornbeam, American Hornbeam. The eastern hornbeam arrives to the least height of all the sorts: about ten feet is the farthest of its growth, and it looks pretty enough with trees of the same growth. The leaves are by no means so large as the common sort; and as the branches are always closer in proportion to the smallness of the leaves, where a low hedge is wanted of the deciduous kind, this would not be an improper tree for the purpose, either to be kept sheered, or suffered to grow in its natural state. The bark of this sort is more spotted than that of the common. The flowering hornbeam is the most free shooter of any of the sorts; and will arrive to be the highest, the common hornbeam only excepted. It will grow to be thirty or forty feet high. The branches of this tree are less spotted with greyish spots than any of the other sorts. The leaves are very rough, of a dark-green colour, and are longer than the common sort. The property which the common hornbeam is possessed of, of retaining its leaves all winter, does not belong to this sort, the leaves of which constantly fall off in the autumn with other deciduous trees. American hornbeam is a more elegant tree than any of the former sorts. The branches are slender, covered with a brownish speckled bark, and are more sparingly sent forth than from any of the others. The leaves are oblong, pointed, and of a palish green, and are not nearly so rough as the common hornbeam, though the flowers and fruit are produced in the same manner.

2. The ostrya, or hop-hornbeam, a native of Italy and of Virginia. This is of taller growth than the eastern kind. It will arrive to the height of twenty feet, or more. The leaves are nearly the size of the common

Carpinus.

Carpinus common sort, and some people admire this tree on account of the singular appearance it makes with its seeds, before they begin to fall. There is a variety which grows to thirty feet high, shoots freely, has long rough leaves like those of the elm, and longish yellow-coloured flowers, called the *Virginian flowering hop-hornbeam*.

Carpocratians.

Propagation. The common hornbeam may be propagated either by layering (at almost any time of the year), or from seeds in the following manner: In the autumn the seeds will be ripe; when, having gathered a sufficient quantity for the purpose, let them be spread upon a mat a few days to dry. After this, they should be sown in the feminary-ground, in beds four feet wide, with an alley of about two feet, and from one to two inches deep. In this bed they must remain till the second spring before they make their appearance; and all the summer they lie concealed, the weeds should constantly be plucked up as soon as they peep; for if they are neglected, they will get so strong, and the fibres of their roots will be so far struck down among the seeds, as to endanger the drawing many seeds out with them, on weeding the ground. After the young plants appear, they should constantly be kept clear of weeds during the next summer; and if they were to be now and then gently refreshed with water in dry weather, it would prove serviceable to them. In the spring following they may be taken out of these beds, and planted in the nursery, in which situation they may remain till they are of a sufficient size to plant out for standards.

The other sorts are to be propagated by layers; for which purpose a few plants for stools must be procured. The stools of the eastern hornbeam should be planted a yard, and the other sorts a yard and a half or two yards asunder. After these plants have made some young shoots, they should be layered in the autumn, and by that time twelvemonth they will have struck root; at which time, or any time in the winter, or early in the spring, they should be taken off, and planted in the nursery-way, observing always to brush up the stool, that it may afford fine young shoots for fresh layering by the autumn following. The distance the plants should be allowed in the nursery need be no more than one foot, in rows that are two feet asunder; and here they may stand, with the usual nursery care of weeding and digging the rows in winter, until they are to be finally planted out; though the Virginian hornbeam will frequently send forth two shoots, which will seem to strive for mastery in the lead. When this is observed, the weakest should always be taken away, otherwise the tree will grow forked.

CARPOBALSAM, in the *Materia Medica*, the fruit of the tree which yields the true oriental balsam. The carpobalsam is used in Egypt, according to Prosper Alpinus, in all the intentions in which the balsam itself is applied: but the only use the Europeans make of it is in Venice treacle and mithridate; and in these not a great deal, for cubebs and juniper-berries are generally substituted in its place.

CARPOCRATIANS, a branch of the ancient Gnostics, so called from *Carpocrates*, who in the second century revived and improved upon the errors of Simon Magus, Menander, Saturninus, and other

Gnostics. He owned, with them, one sole principle and father of all things, whose name as well as nature was unknown. The world, he taught, was created by angels, vastly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inculcated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations, making that a necessary condition of perfection.

CARPOLITHI, or **FRUIT-STONE ROCKS** of the Germans, are composed of a kind of jasper, of the nature of the amygdaloides, or almond-stones. Bertrand asserts that the latter are those which appear to be composed of elliptical pieces like petrified almonds, though in truth they are only small oblong pieces of calcareous stone rounded by attrition, and sometimes small muscle-shells connected by a stony concretion. The name of carpolithi, however, is given in general by writers on fossils to all sorts of stony concretions that have any resemblance to fruit of whatever kind.

CARPUS, the wrist. See *ANATOMY*, No 53.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See *CHARIOT*.

The word is from the ancient Gaulish, or Celtic, *Carr*; mentioned by Cæsar, in his commentaries, under the name *Carrus*. Plutarch relates, that Camillus having entered Rome in triumph, mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

CARR is also used for a kind of light open chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies either a triumph or an apotheosis: sometimes a procession of the images of the gods at a solemn supplication, and sometimes of those of some illustrious family at a funeral. The carr covered, and drawn by mules, only signifies a consecration, and the honour done any one of having his image carried at the games of the circus. See *CONSECRATION*, &c.

CARRAC, or **CARRACA**, a name given by the Portuguese to the vessels they send to Brasil and the East-Indies; being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians. It is a custom among the Portuguese, when the carracs returned from India, not to bring any boat or sloop for the service of the ship beyond the island of St Helena; at which place they sink them on purpose, in order to take from the crew all hopes or possibility of saving themselves, in case of shipwreck.

CARRARA MARBLE, among our artificers, the name of a species of white marble, which is called *marmor lunense*, and *ligustrium* by the ancients: it is distinguished from the Parian, now called the statuary marble, by being harder and less bright.

CAR

Carpolithi
||
Carrara.

Carraveira CARRAVEIRA, a town of Turkey in Europe, with a Greek archbishop's see. E. Long. 22. 25. N. Lat. 40. 27.

Carrick CARRIAGE, a vehicle serving to convey persons, goods, merchandizes, and other things, from one place to another.

For the construction and mechanical principles of wheel-carriages, see MECHANICS.

CARRIAGE of a cannon, the frame or timber work on which it is mounted, serving to point it for shooting, or to carry it from one place to another. It is made of two planks of wood, commonly of one-half the length of the gun, called the cheeks, and joined by three wooden transoms, strengthened with three bolts of iron. It is mounted on two wheels, but on a march has two fore-wheels with limbers added. The principal parts of a carriage are the cheeks, transoms, bolts, plates, train, bands, bridge, bed, hooks, trunnion holes, and capsquare.

Block-CARRIAGE, a cart made on purpose for carrying mortars and their beds from place to place.

Truck-CARRIAGE, two short planks of wood, supported on two axle-trees, having four trucks of solid wood for carrying mortars or guns upon battery, where their own carriages cannot go. They are drawn by men.

CARRICK, the southern division of the shire of Ayr in Scotland. It borders on Galloway; stretches 32 miles in length; and is a hilly country fit for pasturage. The chief rivers are the Stencher and Girven, both abounding with salmon; here are also several lakes and forests; and the people on the coast employ themselves in the herring-fishery, though they have no harbour of any consequence. The only towns of this district are Bargeny and Maybole, two considerable villages, yet the first gave the title (now extinct) of baron to a branch of the Hamilton family. The prince of Wales, as prince of Scotland, is earl of Carrick.

GARRICK on the Sure, a town of Ireland, in the county of Tipperary and province of Munster. W. Long. 7. 14. N. Lat. 52. 16.

GARRICK-Fergus, a town of Ireland, in the county of Antrim and province of Ulster. It is a town and county in itself, and sends two members to parliament. It is very rich and populous, with a good harbour; and is governed by a mayor, recorder, and sheriffs.—It has, however, been of far greater consequence than at present, as appears from the mayor having been admiral of a considerable extent of coast in the counties of Down and Antrim, and the corporation enjoying the customs paid by all vessels within these bounds, the creeks of Belfast and Bangor excepted. This grant was repurchased, and the custom-house transferred to Belfast.—Here is the skeleton of a fine house built by Lord Chichester in the reign of James I. an old Gothic church with many family monuments, and a very large old castle. The town was formerly walled round, and some part of the walls is still remaining entire.—Carrick-fergus is seated on a bay of the same name in the Irish channel; and is noted for being the landing place of king William in 1690. Here also Thurot made a descent in 1759, took possession of the castle, and carried away hostages for the ransom of the town; but

being soon after pursued by commodore Elliot, his three ships were taken, and he himself was killed. *Carrier.*

CARRIER, is a person that carries goods for others for hire. A common carrier, having the charge and carriage of goods, is to answer for the same, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an inn-keeper who refuses to entertain a guest. See ASSUMPSIT.

One brought a box to a carrier, with a large sum of money, and the carrier demanded of the owner what was in it; he answered, that it was filled with silks, and such like goods: upon which the carrier took it, and was robbed, and adjudged to make it good; but a special acceptance, as, *provided there is no charge of money*, would have excused the carrier.—A person delivered to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and told him that it was L. 200, and took his receipt for the same, with promise of delivery for 10 s. *per cent.* carriage and risk: though it be proved that there was L. 400 in the bags, if the carrier be robbed, he shall answer only for L. 200, because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a common carrier loses goods which he is intrusted to carry, a special action on the case lies against him, on the custom of the realm, and not trover; and so of a common carrier by boat. An action will lie against a porter, carrier, or barge-man, upon his bare receipt of the goods, if they are lost through negligence. Also a lighter-man spoiling goods he is to carry, by letting water come to them, action of the case lies against him, on the common custom. *Jacob's Law Dict.*

CARRIER-Pigeon, or *courier-pigeon*, a sort of pigeon used, when properly trained, to be sent with letters from one place to another. See COLUMBA.

Though you carry these birds hood-winked, 20, 30, nay, 60 or 100 miles, they will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried first, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Every Bashaw has a basket of these pigeons bred in the seraglio, which, upon any emergent occasion, as an insurrection, or the like, he dispatches, with letters braced under their wings, to the seraglio; which proves a more speedy method, as well as a more safe one, than any other; he sends out more than one pigeon, however, for fear of accidents. Lithgow assures us, that one of these birds will carry a letter from Babylon to Aleppo, which is 30 days journey, in 48 hours. This is also a very ancient practice; Hirtius and Brutus, at the siege of Modena, held a correspondence with one another by means of pigeons. And Ovid tells us, that Taurosthenes, by a pigeon stained with purple, gave notice to his father of his victory at the Olympic Games, sending it to him at Ægina.

In modern times, the most noted were the pigeons of Aleppo,

Carrier,
Carron.

Aleppo, which served as couriers at Alexandretta and Bagdad. But this use of them has been laid aside for the last 30 or 40 years, because the Curd robbers killed the pigeons. The manner of sending advice by them was this: they took pairs which had young ones, and carried them on horseback to the place from whence they wished them to return, taking care to let them have a full view. When the news arrived, the correspondent tied a billet to the pigeon's foot, and let her loose. The bird, impatient to see its young, flew off like lightning, and arrived at Aleppo in ten hours from Alexandretta, and in two days from Bagdad. It was not difficult for them to find their way back, since Aleppo may be discovered at an immense distance. This pigeon has nothing peculiar in its form, except its nostrils, which, instead of being smooth and even, are swelled and rough.

CARRON, a small but remarkable river in Scotland, rising about the middle of the isthmus between the friths of Forth and Clyde. Both its source, and the place where it emptieth itself into the sea, are within the shire of Stirling, which it divides into two nearly equal parts. The whole length of its course, which is from west to east, is not above 14 miles. It falls into the frith of Forth about three miles to the north-east of Falkirk. The stream thereof is but small, and scarce deserves the notice of a traveller; yet there is no river in Scotland, and few in the whole island of Britain, whose banks have been the scene of so many memorable transactions. When the Roman empire was in all its glory, and had its eastern frontiers upon the Euphrates, the banks of Carron were its boundaries upon the north-west; for the wall of Antoninus*, which was raised to mark the limits of that mighty empire, stood in the neighbourhood of this river, and ran parallel to it for several miles.

* See Anto-
ninus's Wall.

Near the middle of its course, in a pleasant valley, stand two beautiful mounts, called the *Hills of Dunipace*, which are taken notice of by most of the Scottish historians as monuments of great antiquity. The whole structure of these mounts is of earth; but they are not both of the same form and dimensions. The more easterly one is perfectly round, resembling an oven, and about fifty feet in height: And that this is an artificial work does not admit of the least doubt; but we cannot affirm the same, with equal certainty, of the other, though it has been generally supposed to be so too. It bears no resemblance to the eastern one either in shape or size. At the foundation it is nearly of a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mounts are now planted with firs, which, with the parish-church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account given of these mounts is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians, and that their name partakes of the language of both people; *Dun* signifying a hill in the old language of this island, and *Pax* "peace" in the language of Rome. The compound word, *Dunipace*, signifies "the hills of peace." And we find in history, that no less than three treaties

of peace were, at different periods, entered into between the Romans and Caledonians; the first, by Severus, about the year 210; the second, soon after, by his son Caracalla; and the third, by the usurper Carausius, about the year 280; but of which of those treaties Dunipace is a monument, we do not pretend to determine. If the concurring testimony of historians and antiquaries did not agree in giving this original to these mounts, we would be tempted to conjecture that they are sepulchral monuments. Human bones and urns have been discovered in earthen fabrics of this kind in many parts of this island, and the little mounts or barrows, which are scattered in great numbers about Stonhenge in Salisbury plain are generally supposed to have been the sepulchres of the ancient Britons. See BARROWS.

From the valley of Dunipace, the river runs for some time in a deep and hollow channel, with steep banks on both sides: here it passes by the foundations of the ancient Roman bridge; not far from which, as is generally thought, was the scene of the memorable conference betwixt the Scottish patriot William Wallace and Robert Bruce, father to the king of that name, which first opened the eyes of the latter to a just view, both of his own true interest and that of his country.

After the river has left the village and bridge of Laibert, it soon comes up to another small valley, through the midst of which it has now worn out to itself a straight channel; whereas, in former ages, it had taken a considerable compass, as appears by the tract of the old bed, which is still visible. The high and circling banks upon the south-side, give to this valley the appearance of a spacious bay; and, according to the tradition of the country, there was once an harbour here: nor does the tradition seem altogether groundless; pieces of broken anchors having been found here, and some of them within the memory of people yet alive. The stream-tides would still flow near the place, if they were not kept back by the dam-head built across the river at Stenhouse; and there is reason to believe, that the frith flowed considerably higher in former ages than it does at present. In the near neighbourhood of this valley, upon the south, stand the ruins of ancient Camelon; which, after it was abandoned by the Romans, was probably inhabited, for some ages, by the natives of the country.

Another ancient monument, called *Arthur's Oven*, once stood upon the banks of Carron; but was, with a spirit truly Gothic, entirely demolished about 40 years ago. The corner of a small inclosure between Stenhouse and the Carron iron-works, is pointed out as the place of its situation. This is generally supposed to have been a Roman work; though it is not easy to conceive what could be their motive for erecting such a fabric, at so great a distance from any other of their works, and in a spot which, at that time, must have been very remote and unfrequented. The form of it is said to have been perfectly round, and rising perpendicular for some yards at first, but afterwards gradually contracted, till it terminated in a narrow orifice at the top. Antiquaries are not agreed whether it had been a temple, or a trophy, or a mausoleum; but the most common opinion is, that it had been a temple, and,

Carron.

Carron. and, Buchanan thinks, a temple of Terminus. Hector Boetius says, that there were benches of stone all around it, upon the inside; and that there had been a large stone for sacrificing upon, or an altar, upon the south side.

As Carron extends over the half of the isthmus, and runs so near the ancient boundaries of the Roman empire, the adjacent country fell naturally to be the scene of many battles and rencounters. Historians mention a bloody battle fought near this river between the Romans and the confederate army of the Scots and Picts in the beginning of the 5th century. The scenes of some of Ossian's poems were, in the opinion of the translator, upon the banks of this river. Here Fingal fought with Caracal, the son of the king of the world, supposed to have been the same with Caracalla the son of the Roman emperor Severus. Here also young Oscar, the son of Ossian, performed some of his heroic exploits. Hereabout was the stream of Crona, celebrated in the ancient compositions of the Gaelic bard; possibly that now called the water of Bonny, which runs in the neighbourhood of the Roman wall, and dischargeth itself into Carron at Dunipace. In those poems, mention is made of a green vale upon the banks of this river, with a tomb standing in the middle of it, where young Oscar's party and the warriors of Caros met. We only take notice of this as it strengthens the conjecture hazarded above, that the mounts of Dunipace, especially the more easterly of them, were sepulchral monuments.—About the distance of half a mile from the river, and near the town of Falkirk, lies the field of that battle which was fought by William Wallace and the English in the beginning of the 14th century. It goes by the name of *Graham's muir*, from the valiant John Graham, who fell there, and whose grave-stone is still to be seen in the church-yard of Falkirk.

The river Carron, though it hath long since ceased to roll its stream amidst the din of arms, still preserves its fame, by lending its aid to trade and manufactures; (see the next article.)—The river is navigable for some miles near its mouth, and a considerable trade is carried on upon it by small craft; for the convenience of which, its channel has of late years been straightened and much shortened, and the great Canal* has its entrance from it.

* See the article *Canal*.

CARRON-Works, a large iron-foundery, two miles north from Falkirk in Scotland. They are conveniently situated on the banks of the Carron, three miles above its entry into the frith of Forth. Above 100 acres of land have been converted into reservoirs and pools, for water diverted from the river, by magnificent dams built about two miles above the works, which, after turning 18 large wheels for the several purposes of the manufacture, falls into a tide-navigation that conveys their castings to the sea.

These works are the greatest of the kind in Europe, and were established in 1760. At present, the buildings are of vast extent; and the machinery, constructed by Mr Smeaton, is the first in Britain, both in elegance and correctness: there are 1600 men employed, to whom is paid weekly above 650 l. Sterling; which has greatly enriched the adjoining country: 6500 tons of iron are smelted annually from the

Nº 65.

mineral with pit-coal, and cast into cannon, cylinders, &c.—In the founding of cannon, these works have lately arrived at such perfection, that they make above 5000 pieces a-year, many of which are exported to foreign states; and their guns of *new construction* are the lightest and neatest now in use, not excepting brass guns; the 32 pounder ship-gun weighing 42 hundred-weight, the 6 pounder 8 hundred-weight and one half, and the other calibers in proportion.

The present proprietors are a chartered company, with a capital of 150,000 l. Sterling, a common seal, &c. but their stock is confined to a very few individuals.

CARRONADE, a short kind of ordnance, capable of carrying a large ball, and useful in close engagements at sea. It takes its name from Carron, the place where this sort of ordnance was first made, or the principle applied to an improved construction. See the article **GUNNERY**, nº 45, 46.

CARROT, in Botany. See **DAUCUS**.

Deadly-CARROT. See **THAPSIA**.

CARROUSAL, a course of horses and chariots, or a magnificent entertainment exhibited by princes on some public rejoicing. It consists in a cavalcade of several gentlemen, richly dressed and equipped after the manner of ancient cavaliers, divided into squadrons, meeting in some public place, and practising jousts, tournaments, &c. The last carroufals were in the reign of Louis XIV.—The word comes from the Italian word *carosello*, a diminutive of *carrò*, "chariot." Tertullian ascribes the invention of carroufals to Circe; and will have them instituted in honour of the Sun, her father; whence some derive the word from *carrus* or *currus solis*. The Moors introduced cyphers, liveries, and other ornaments of their arms, with trappings, &c. for their horses. The Goths added crests, plumes, &c.

CARRUCA, in antiquity, a splendid kind of carr, or chariot, mounted on four wheels, richly decorated with gold, silver, ivory, &c. in which the emperors, senators, and people of condition, were carried. The word comes from the Latin *carrus*, or British carr, which is still the Irish name for any wheel-carriage.

CARRUCA, or **CARUCA**, is also used in middle-age writers for a plough.

CARRUCA was also sometimes used for *carrucata*. See **CARRUCATE**.

CARUCAGE, (*carucagium*), a kind of tax anciently imposed on every plough, for the public service. See **CARRUCATE** and **HIDAGE**.

CARRUCAGE, **CARUCAGE**, or **CARUAGE**, in husbandry, denotes the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for woad, dyers weed, rape, and the like.

CARRUCATE, (*carrucata*), in our ancient laws and history, denotes a plough-land, or as much arable ground as can be tilled in one year with one plough.

In Doomfday Inquisition, the arable land is estimated in carrucates, the pasture in hides, and meadow in acres. Skene makes the *carrucata* the same with *hilda*, or *bida terra*; Littleton the same with *soc*.

The measure of a carrucate appears to have differed in respect of place as well as time. In the reign of Richard I. it was estimated at 60 acres, and in another

Carrying
Carstairs.

another charter of the same reign at 100 acres: in the time of Edward I. at 180 acres: and in the 23d of Edward III. a carrucate of land in Bureester contained 112 acres, and in Middleton 150 acres.

By a statute under William III. for charging persons to the repair of the highways, a plough-land is rated at a fifty pounds *per annum*, and may contain houses, mills, wood, pasture, &c.

CARRYING, in falconry, signifies a hawk's flying away with the quarry. Carrying is one of the ill qualities of a hawk, which she acquires either by a dislike of the falconer, or not being sufficiently broke to the lure.

CARRYING, among huntsmen. When a hare runs on rotten ground (or even sometimes in a frost), and it sticks to her feet, they say she carries.

CARRYING, among riding-masters. A horse is said to carry low, when having naturally an ill-shaped neck, he lowers his head too much. All horses that arm themselves carry low, but a horse may carry low without arming. A French branch, or gigot, is prescribed as a remedy against carrying low.

A horse is said to carry well, when his neck is raised, or arched, and he holds his head high and firm, without constraint.

CARRYING *Wind*, a term used by our dealers in horses to express such a one as frequently tosses his nose as high as his ears, and does not carry handsomely. This is called *carrying wind*; and the difference between carrying in the wind, and beating upon the hand, is this: that the horse who beats upon the hand, shakes the bridle and resists it, while he shakes his head; but the horse that carries in the wind puts up his head without shaking, and sometimes beats upon the hand. The opposite to carrying in the wind, is arming and carrying low; and even between these two there is a difference in wind.

CARS, or KARS, a considerable and strong town of Asia, in Armenia, seated on a river of the same name, with a castle almost impregnable. E. Long. 43. 50. N. Lat. 41. 30.

CARSE, or *Carse of Gowry*, a district of Perthshire in Scotland. It lies on the north side of the Tay, and extends 14 miles in length from Dundee to Perth, and is from two to four in breadth. It is a rich plain country, cultivated like a garden, and producing as good harvests of wheat as any in Great Britain. It abounds with all the necessaries of life; but from its low damp situation, the inhabitants are subject to agues, and the commonalty are in great want of firing. In this district, not far from the Tay, stands the house of Errol, which formerly belonged to the Earls of that name, the chiefs of the ancient family of Hay, hereditary constables of Scotland.

CARSTAIRS (William), an eminent Scots Divine, whose merit and good fortune called him to act in great scenes, and to associate with men to whose society and intercourse his birth gave him few pretensions to aspire. A small village, in the neighbourhood of Glasgow, was the place of his nativity. His father, of whom little is known, exercised the functions of a clergyman.

Young Carstairs turned his thoughts to the profession of theology; and the persecutions and oppressions of government, both in regard to civil and reli-

VOL. IV. PART I.

gious liberty, having excited his strongest indignation, it became a matter of prudence that he should prosecute his studies in a foreign university. He went accordingly to Utrecht; and his industry and attention being directed with skill, opened up and unfolded those faculties which he was about to employ with equal honour to his country and himself.

During his residence abroad, he became acquainted with Pensionary Fagel, and entered with warmth into the interest of the Prince of Orange. On his return to Scotland to procure a license to teach doctrines which he had studied with the greatest care, he became disgusted with the proud and insolent conduct of Archbishop Sharp, and prepared to revisit Holland; where he knew that religious liberty was respected, and where he hoped he might better his condition by the connections he had formed.

His expectations were not vain. His prudence, his reserve, and his political address, were strong recommendations of him to the Prince of Orange; and he was employed in personal negotiations in Holland, England, and Scotland. Upon the elevation of his master to the English throne, he was appointed the King's chaplain for Scotland, and employed in settling the affairs of that kingdom. William, who carried politics into religion, was solicitous that episcopacy should prevail there as universally as in England. Carstairs, more versant in the affairs of his native country, saw all the impropriety of this project, and the danger that would arise from the enforcing of it. His reasonings, his remonstrances, his intreaties, overcame the firmness of king William. He yielded to considerations founded alike in policy and in prudence; and to Carstairs, Scotland is indebted for the full establishment of its church in the Presbyterian form of government.

The death of King William was a severe affliction to him; and it happened before that Prince had provided for him with the liberality he deserved. He was continued, however, in the office of chaplain for Scotland by Queen Anne; and he was invited to accept the Principality of the University of Edinburgh. He was one of the ministers of the city, and four times moderator of the general assembly. Placed at the head of the church, he prosecuted its interest with zeal and with integrity. Nor were his influence and activity confined to matters of religion. They were exerted with success in promoting the culture of the arts and sciences. The universities of Scotland owe him obligations of the highest kind. He procured, in particular, an augmentation of the salaries of their professors; a circumstance to which may be ascribed their reputation, as it enabled them to cultivate with spirit the different branches of knowledge.

A zeal for truth, a love of moderation and order, prudence and humanity, distinguished Principal Carstairs in an uncommon degree. His religion had no mixture of austerity; his secular transactions were attended with no imputation of artifice; and the versatility of his talents made him pass with ease from a court to a college. He was among the last who suffered torture before the privy-council, in order to make him divulge the secrets intrusted to him, which he firmly resisted; and after the revolution, that inhuman instrument the thumb-screw was given to him in a present by the council.—This excellent person

Carte.

died in 1715; and in 1774 his *State-papers and Letters*, with an account of his life, were published in one vol. 4to, by the Rev. Dr M'Cormick.

CARSUGHI (Rainier), a Jesuit, born at Citerna in Tuscany, in 1647, was the author of a Latin poem, entitled, *Ars bene scribendi*, which is esteemed both for the elegance of the style and for the excellent precepts it contains. He also wrote some good epigrams. He died in 1709.

CARTAMA, a town of Spain in the kingdom of Grenada, formerly very considerable. It is seated at the foot of a mountain, near the river Guadala-Medina, in W. Long. 4. 28. N. Lat. 36. 40.

CART, a land-carriage with two wheels, drawn commonly by horses, to carry heavy goods, &c. from one place to another. The word seems formed from the French *charrette*, which signifies the same, or rather the Latin *carreta*, a diminutive of *carrus*. See CARR.

In London and Westminster carts shall not carry more than twelve sacks of meal, seven hundred and fifty bricks, one chaldron of coals, &c. on pain of forfeiting one of the horses, (6 Geo. I. cap. 6.) By the laws of the city, carr-men are forbidden to ride either on their carts or horses. They are to lead or drive them on foot through the streets on the forfeiture of ten shillings, (Stat. 1 Geo. I. cap. 57.) Criminals used to be drawn to execution in a cart. Bawds and other malefactors are whipped at the cart's tail.

Scripture makes mention of a sort of carts or drags used by the Jews to do the office of threshing. They were supported on low thick wheels, bound with iron, which were rolled up and down on the sheaves, to break them, and force out the corn. Something of the like kind also obtained among the Romans, under the denomination of *plaustra*, of which Virgil makes mention, (Georg. I.)

*Tardaue Eleusine matris volventia plaustra,
Tribulaque, trabeaque.*—

On which Servius observes, that *trabea* denotes a cart without wheels, and *tribula* a sort of cart armed on all sides with teeth, used chiefly in Africa for threshing corn. The Septuagint and St Jerome represent these carts as furnished with saws, inasmuch that their surface was beset with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be crushed to pieces under such carts, moving on wheels set with iron teeth; and the king of Damascus is said to have treated the Israelites of the land of Gilead in the same manner.

CART-BOTE, in law, signifies wood to be employed in making and repairing instruments of husbandry.

CARTS of War, a peculiar kind of artillery anciently in use among the Scots. They are thus described in an act of parliament, A. D. 1456: "It is thocht speidfull, that the King mak request to certain of the great burrows of the land that are of ony myght, to mak carts of weir, and in ilk cart twa gunnis, and ilk ane to have twa chalmers, with the remanent of the graith that effeirs thereto, and an cunnand man to shut thame." By another act, A. D. 1471, the prelates and barons are commanded to provide such carts of war against their old enemies the English.

CARTE (Thomas), the historian, was the son of Mr Samuel Carte prebendary of Litchfield, and born

in 1686. When he was reader in the abbey-church at Bath, he took occasion, in a 30th of January sermon, 1714, to vindicate Charles I. with respect to the Irish massacre, which drew him into a controversy with Mr Chandler the dissenting minister; and on the accession of the present royal family he refused to take the oaths to government, and put on a lay habit. He is said to have acted as a kind of secretary to Bishop Atterbury before his troubles; and in the year 1722, being accused of high treason, a reward of 1000*l.* was offered for apprehending him: but Queen Caroline, the great patroness of learned men, obtained leave for him to return home in security. He published, 1. An edition of Thuanus, in seven volumes folio. 2. The Life of the first Duke of Ormond, three volumes, folio. 3. The History of England, four volumes, folio. 4. A Collection of Original Letters and Papers concerning the affairs of England, two volumes octavo; and some other works. He died in April 1754.—His history of England ends in 1654. His design was to have brought it down to the Revolution; for which purpose he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c.—He had (as he himself says, p. 43. of his Vindication of a full answer to a letter from a bystander), "read abundance of collections relating to the time of King Charles II. and had in his power a series of memoirs from the beginning to the end of that reign; in which all those intrigues and turns at court, at the latter end of that king's life, which bishop Burnet, with all his goût for tales of secret history, and all his genius for conjectures, does not pretend to account for, are laid open in the clearest and most convincing manner; by the person who was most affected by them, and had the best reason to know them."—At his death, all his papers came into the hands of his widow, who afterwards married Mr Jernegan, a member of the church of Rome. They are now deposited in the Bodleian library, having been delivered by Mr Jernegan to the university, 1778, for a valuable consideration. Whilst they were in this gentleman's possession, the earl of Hardwicke paid 200*l.* for the perusal of them. For a consideration of 300*l.* Mr Macpherson had the use of them; and from these and other materials compiled his history and state-papers. Mr Carte was a man of a strong constitution and indefatigable application. When the studies of the day were over, he would eat heartily; and in conversation was cheerful and entertaining.

CARTE-Blanche, a sort of white paper, signed at the bottom with a person's name, and sometimes also sealed with his seal, giving another person power to superscribe what conditions he pleases. Much like this is the French *blanc signe*, a paper without writing, except a signature at the bottom, given by contending parties to arbitrators or friends, to fill up with the conditions they judge reasonable, in order to end the difference.

CARTEL, an agreement between two states for the exchange of their prisoners of war.

CARTEL signifies also a letter of defiance or a challenge to decide a controversy either in a tournament or in a single combat. See DUEL.

CARTEL-Ship, a ship commissioned in time of war to exchange

Carte,
Cartel.

¹Cartes exchange the prisoners of any two hostile powers; also to carry any particular request or proposal from one to another: for this reason, the officer who commands her is particularly ordered to carry no cargo, ammunition, or implements of war, except a single gun for the purpose of firing signals.

CARTES (Rene des), descended of an ancient family in Touraine in France, was one of the most eminent philosophers and mathematicians in the 17th century. At the Jesuits College at la Fleche, he made a very great progress in the learned languages and polite literature, and became acquainted with Father Marfenne. His father designed him for the army; but his tender constitution then not permitting him to expose himself to such fatigues, he was sent to Paris, where he launched into gaming, in which he had prodigious success. Here Marfenne persuaded him to return to study; which he pursued till he went to Holland, in May 1616, where he engaged as a volunteer among the prince of Orange's troops. While he lay in garrison at Breda, he wrote a *treatise on music*, and laid the foundation of several of his works. He was at the siege of Rochelle in 1628; returned to Paris; and, a few days after his return, at an assembly of men of learning in the house of Monsignor Bagni the Pope's Nuncio, was prevailed upon to explain his sentiments with regard to philosophy, when the nuncio urged him to publish his system. Upon this he went to Amsterdam, and from thence to Franeker, where he began his *metaphysical meditations*, and drew up his *discourse on meteors*. He made a short tour to England; and not far from London, made some observations concerning the declination of the magnet. He returned to Holland, where he finished his *treatise on the world*.

His books made a great noise in France; and Holland thought of nothing but discarding the old philosophy, and following his. Voetius being chosen rector of the university of Utrecht, procured his philosophy to be prohibited, and wrote against him; but he immediately published a vindication of himself. In 1647, he took a journey into France, where the king settled a pension of 3000 livres upon him. Christina, queen of Sweden, having invited him into that kingdom, he went thither, where he was received with the greatest civility by her majesty, who engaged him to attend her every morning at five o'clock, to instruct her in philosophy, and desired him to revise and digest all his writings which were unpublished, and to form a complete body of philosophy from them. She likewise proposed to allow him a revenue, and to form an academy of which he was to be the director. But these designs were broken off by his death in 1650. His body was interred at Stockholm, and 17 years afterwards removed to Paris, where a magnificent monument was erected to him in the church of St Genevieve du Mont. The great Dr Halley, in a paper concerning optics, observes, that though some of the ancients mention refraction as an effect of transparent mediums, Des Cartes was the first who discovered the laws of refraction, and reduced dioptrics to a science. As to his philosophy, Dr Keil, in his introduction to his examination of Dr Burnet's theory of the earth, says, that Des Cartes was so far from applying

geometry to natural philosophy, that his whole system is one continued blunder on account of his negligence in that point; the laws observed by the planets in their revolutions round the sun, not agreeing with his theory of vortices. His philosophy has accordingly given way to the more accurate discoveries and demonstrations of the Newtonian system.

CARTESIANS, a sect of philosophers, who adhered to the system of Des Cartes, founded on the two following principles, the one metaphysical, the other physical. The metaphysical one is, *I think, therefore I am*: the physical principle is, that *nothing exists but substance*. Substance he makes of two kinds; the one a substance that thinks, the other a substance extended; whence actual thought, and actual extension, are the essence of substance.

The essence of matter being thus fixed in extension, the Cartesians conclude that there is no vacuum, nor any possibility thereof in nature; but that the universe is absolutely full: mere space is excluded by this principle; because extension being implied in the idea of space, matter is so too. Upon these principles, the Cartesians explained mechanically how the world was formed, and how the present celestial phenomena came to take place. See ASTRONOMY, n° 252.

CARTHAGE, a famed city of antiquity, the capital of Africa Propria; and which, for many years, disputed with Rome the sovereignty of the world. According to Velleius Paterculus, this city was built 65, according to Justin and Trogus 72, according to others 100 or 140 years before the foundations of Rome were laid. It is on all hands agreed that the Phœnicians were the founders.

The beginning of the Carthaginian history, like that of all other nations, is obscure and uncertain. In the 7th year of Pygmalion king of Tyre, his sister Elifa, or Dido, is said to have fled, with some of her companions and vassals, from the cruelty and avarice of her brother Sichæus.

She first touched at the island of Cyprus, where she met with a priest of Jupiter, who was desirous of attending her; to which she readily consented, and fixed the priesthood in his family. At that time, it was a custom in the island of Cyprus, for the young women to go on certain stated days, before marriage, to the sea-side, there to look for strangers, that might possibly arrive on their coasts, in order to prostitute themselves for gain, that they might thereby acquire a dowry. Out of these, the Tyrians selected 80, whom they carried along with them. From Cyprus they sailed directly for the coast of Africa; and at last safely landed in the province called *Africa Propria*, not far from Utica, a Phœnician city of great antiquity. The inhabitants received their countrymen with great demonstrations of joy, and invited them to settle among them. The common fable is, that the Phœnicians imposed upon the Africans in the following manner: They desired, for their intended settlement, only as much ground as an ox's hide would encompass. This request the Africans laughed at: but were surprised, when, upon their granting it, they saw Elifa cut the hide into the smallest shreds, by which means it surrounded a large territory; in which she built the citadel called *Byrsa*. The learned, however, are now un-

³ Carthage. unanimous in exploding this fable; and it is certain that the Carthaginians for many years paid an annual tribute to the Africans for the ground they possessed.

The new city soon became populous and flourishing, by the accession of the neighbouring Africans, who came thither at first with a view of traffic. In a short time it became so considerable, that *Jarbas*, a neighbouring prince, thought of making himself master of it without any effusion of blood. In order to this, he desired that an embassy of ten of the most noble Carthaginians might be sent him; and, upon their arrival, proposed to them a marriage with Dido, threatening war in case of a refusal. The ambassadors, being afraid to deliver this message, told the queen that Jarbas desired some person might be sent him who was capable of civilizing his Africans; but that there was no possibility of finding any of her subjects who would leave his relations for the conversation of such barbarians. For this they were reprimanded by the queen; who told them that they ought to be ashamed of refusing to live in any manner for the benefit of their country. Upon this, they informed her of the true nature of their message from Jarbas; and that, according to her own decision, she ought to sacrifice herself for the good of her country. The unhappy queen, rather than submit to be the wife of such a barbarian, caused a funeral pile to be erected, and put an end to her life with a dagger.

⁴ She kills herself.

This is Justin's account of the death of Queen Dido, and is the most probable; Virgil's story of her amour with *Æneas*, being looked upon as fabulous, even in the days of Macrobius, as we are informed by that historian. How long monarchical government continued in Carthage, or what happened to this state in its infancy, we are altogether ignorant, by reason of the Punic Archives being destroyed by the Romans; so that there is a chasm in the Carthaginian history for above 300 years. It, however, appears, that from the very beginning, the Carthaginians applied themselves to maritime affairs, and were formidable by sea in the time of Cyrus and Cambyfes. From Diodorus Siculus and Justin, it appears, that the principal support of the Carthaginians were the mines of Spain, in which country they seem to have established themselves very early. By means of the riches drawn from these mines, they were enabled to equip such formidable fleets as we are told they fitted out in the time of Cyrus or Cambyfes. Justin insinuates, that the first Carthaginian settlement in Spain happened when the city of Gades, now Cadis, was but of late standing, or even in its infancy. The Spaniards finding this new colony begin to flourish, attacked it with a numerous army, inasmuch that the inhabitants were obliged to call in the Carthaginians to their aid. The latter very readily granted their request, and not only repulsed the Spaniards, but made themselves masters of almost the whole province in which their new city stood. By this success, they were encouraged to attempt the conquest of the whole country: but having to do with very warlike nations, they could not push their conquests to any great length at first; and it appears from the accounts of Livy and Polybius, that the greatest part of Spain remained unsubdued till the times of Hamilcar, Asdrubal, and Hannibal.

About 503 years before the birth of Christ, the

Carthaginians entered into a treaty with the Romans. Carthage. It related chiefly to matters of navigation and commerce. From it we learn, that the whole island of Sardinia, and part of Sicily, were then subject to Carthage; that they were very well acquainted with the coasts of Italy, and had made some attempts upon them before this time; and that, even at this early period, a spirit of jealousy had taken place between the two republics. Some time near this period, the Carthaginians had a mind to discontinue the tribute they had hitherto paid the Africans for the ground on which their city stood. But, notwithstanding all their power, they were at present unsuccessful; and at last were obliged to conclude a peace, one of the articles of which was, that the tribute should be continued.

⁶ First treaty between Carthage and Rome.

By degrees the Carthaginians extended their power over all the islands in the Mediterranean, Sicily excepted; and for the entire conquest of this, they made vast preparations, about 480 years before Christ. Their army consisted of 300,000 men; their fleet was composed of upwards of 2000 men of war, and 3000 transports; and with such an immense armament, they made no doubt of conquering the whole island in a single campaign. In this, however, they found themselves miserably deceived. Hamilcar their general having landed his numerous forces, invested Himera, a city of considerable importance. He carried on his attacks with the greatest assiduity; but was at last attacked in his trenches by Gelon and Theron, the tyrants of Syracuse and Agrigentum, who gave the Carthaginians one of the greatest overthrows mentioned in history. An hundred and fifty thousand were killed in the battle and pursuit, and all the rest taken prisoners; so that of so mighty an army, not a single person escaped. Of the 2000 ships of war and 3000 transports, of which the Carthaginian fleet consisted, eight ships only, which then happened to be out at sea, made their escape: these immediately set sail for Carthage; but were all cast away, and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal news of the total loss of the fleet and army. No words can express the consternation of the Carthaginians upon receiving the news of so terrible a disaster. Ambassadors were immediately dispatched to Sicily, with orders to conclude a peace upon any terms. They put to sea without delay; and landing at Syracuse, threw themselves at the conqueror's feet. They begged Gelon, with many tears, to receive their city into favour, and grant them a peace on whatever terms he should choose to prescribe. He granted their request upon condition that Carthage should pay him 2000 talents of silver to defray the expences of the war; that they should build two temples, where the articles of the treaty should be lodged and kept as sacred; and that for the future they should abstain from human sacrifices. This was not thought a dear purchase of a peace for which there was such occasion; and to show their gratitude for Gelon's moderation, the Carthaginians complimented his wife Demarata with a crown of gold worth 100 talents.

⁷ Sicily invaded by the Carthaginians.

⁸ They are utterly destroyed.

⁹ Peace concluded.

From this time we find little mention of the Carthaginians for 70 years. Some time during this period, however, they had greatly extended their dominions

⁵ Spanish mines of vast service to the Carthaginians.

⁹ Carthage. minions in Africa, and likewise shaken off the tribute which gave them so much uneasiness. They had warm disputes with the inhabitants of Cyrene the capital of Cyrenaica, about a regulation of the limits of their respective territories. The consequence of these disputes was a war, which reduced both nations so low, that they agreed first to a cessation of arms, and then to a peace. At last it was agreed, that each state should appoint two commissaries, who should set out from their respective cities on the same day, and that the spot on which they met should be the boundary of both states. In consequence of this, two brothers called *Philæni* were sent out from Carthage, who advanced with great celerity, while those from Cyrene were much more slow in their motions. Whether this proceeded from accident or design, or perfidy, we are not certainly informed; but, be this as it will, the Cyreneans finding themselves greatly outstripped by the *Philæni*, accused them of breach of faith, asserting that they had set out before the time appointed, and consequently that the convention between their principals was broken. The *Philæni* desired them to propose some expedient whereby their differences might be accommodated; promising to submit to it, whatever it might be. The Cyreneans then proposed, either that the *Philæni* should retire from the place where they were, or that they should be buried alive upon the spot. With this last condition the brothers immediately complied, and by their death gained a large extent of territory to their country. The Carthaginians ever after celebrated this as a most brave and heroic action; paid them divine honours; and endeavoured to immortalize their names by erecting two altars there, with suitable inscriptions upon them.

¹² Sicily invaded anew. About the year before Christ 412, some disputes happening between the *Egestines* and *Selinuntines*, inhabitants of two cities in Sicily, the former called in the Carthaginians to their assistance; and this occasioned a new invasion of Sicily by that nation. Great preparations were made for this war; Hannibal, whom they had appointed general, was empowered to raise an army equal to the undertaking, and equip a suitable fleet. They also appointed certain funds for defraying all the expences of the war, intending to exert their whole force to reduce the island under their subjection.

¹³ Emporium and Selinus taken. The Carthaginian general having landed his forces, immediately marched for *Selinus*. In his way he took *Emporium*, a town situated on the river *Mazara*; and having arrived at *Selinus*, he immediately invested it. The besieged made a very vigorous defence; but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conquerors, except the women who fled to the temples; and these escaped, not through the merciful disposition of the Carthaginians, but because they were afraid, that if driven to despair they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; 2250 escaped to *Agrigentum*; and the women and children, about 5000 in number, were carried away captives. At the same time the temples were plundered, and the city rased to the ground.

After the reduction of *Selinus*, Hannibal laid siege to *Himera*; that city he desired above all things to become master of, that he might revenge the death of his grandfather *Hamilcar*, who had been slain before it by *Gelon*. His troops, flushed with their late success, behaved with undaunted courage; but finding his battering engines not to answer his purpose sufficiently, he undermined the wall, supporting it with large beams of timber, to which he afterwards set fire, and thus laid part of it flat on the ground. Notwithstanding this advantage, however, the Carthaginians were several times repulsed with great slaughter; but at last they became masters of the place, and treated it in the same manner as they had done *Selinus*. After this, Hannibal, dismissing his Sicilian and Italian allies, returned to Africa.

The Carthaginians were now so much elated, that they meditated the reduction of the whole island. But as the age and infirmities of Hannibal rendered him incapable of commanding the forces alone, they joined in commission with him *Imilcar* the son of *Hanno*, one of the same family. On the landing of the Carthaginian army, all Sicily was alarmed, and the principal cities put themselves into the best state of defence they were able. The Carthaginians immediately marched to *Agrigentum*, and began to batter the walls with great fury. The besieged, however, defended themselves with incredible resolution, in a sally burnt all the machines raised against their city, and repulsed the enemy with great slaughter. The *Syracusians* in the mean time, being alarmed at the danger of *Agrigentum*, sent an army to its relief. On their approach they were immediately attacked by the Carthaginians; but after a sharp dispute the latter were defeated, and forced to fly to the very walls of *Agrigentum*, with the loss of 6000 men. Had the *Agrigentine* commanders now sallied out, and fallen upon the fugitives, in all probability the Carthaginian army must have been destroyed; but either through fear or corruption, they refused to stir out of the place, and this occasioned the loss of it. Immense booty was found in the city; and the Carthaginians behaved with their usual cruelty, putting all the inhabitants to the sword, not excepting even those who had fled to the temples.

The next attempt of the Carthaginians was designed against the city of *Gela*: but the *Geleans*, being greatly alarmed, implored the protection of *Syracuse*; and, at their request, *Dionysius* was sent to assist them with 2000 foot and 400 horse. The *Geleans* were so well satisfied with his conduct, that they treated him with the highest marks of distinction; they even sent ambassadors to *Syracuse* to return thanks for the important services done them by sending him thither; and soon after he was appointed generalissimo of the *Syracusan* forces and those of their allies against the Carthaginians. In the mean time *Imilcar*, having rased the city of *Agrigentum*, made an incursion into the territories of *Gela* and *Comarina*; which having ravaged in a dreadful manner, he carried off such immense quantity of plunder, as filled his whole camp. He then marched against the city: but though it was but indifferently fortified, he met with a very vigorous resistance; and the place held out for a long time without receiving any assistance from its allies.

Carthage. At last Dionysius came to its assistance with an army of 50,000 foot and 1000 horse. With these he attacked the Carthaginian camp, but was repulsed with great loss; after which, he called a council of war, the result of whose deliberations was, that since the enemy was so much superior to them in strength, it would be highly imprudent to put all to the issue of a battle; and therefore, that the inhabitants should be persuaded to abandon the country, as the only means of saving their lives. In consequence of this, a trumpet was sent to Imilcar to desire a cessation of arms till the next day, in order, as was pretended, to bury the dead, but in reality to give the people of Gela an opportunity of

18
Abandoned
by its inha-
bitants.

making their escape. Towards the beginning of the night the bulk of the citizens left the place; and he himself with the army followed them about midnight. To amuse the enemy, he left 2000 of his light armed troops behind him, commanding them to make fires all night, and set up loud shouts as though the army still remained in town. At day-break these took the same route as their companions, and pursued their march with great celerity. The Carthaginians finding the city deserted by the greatest part of its inhabitants, immediately entered it, putting to death all who had remained; after which, Imilcar having thoroughly plundered it, moved towards Camarina. The inhabitants of this city had been likewise drawn off by Dionysius, and it underwent the same fate with Gela.

19
Peace con-
cluded.

Notwithstanding these successes, however, Imilcar finding his army greatly weakened, partly by the casualties of war, and partly by a plague which broke out in it, sent a herald to Syracuse to offer terms of peace. His unexpected arrival was very agreeable to the Syracusians, and a peace was immediately concluded upon the following terms, *viz.* That the Carthaginians, besides their ancient acquisitions in Sicily, should still possess the countries of the Silicani, the Selinuntines, the Himereans, and Agrigentines; that the people of Gela and Camarina should be permitted to reside in their respective cities, which yet should be dismantled, upon their paying an annual tribute to the Carthaginians; that all the other Sicilians should preserve their independency except the Syracusians, who should continue in subjection to Dionysius.

Dionysius
breaks the
treaty.

The tyrant of Syracuse, however, had concluded this peace with no other view than to gain time, and to put himself in a condition to attack the Carthaginian territories with greater force. Having accomplished this, he acquainted the Syracusians with his design, and they immediately approved of it; upon which he gave up to the fury of the populace the persons and possessions of the Carthaginians who resided in Syracuse, and traded there on the faith of treaties. As there were many of their ships at that time in the harbour, laden with cargoes of great value, the people immediately plundered them; and, not content with this, ransacked all their houses in a most outrageous manner. This example was followed throughout the whole island; and in the mean time Dionysius dispatched a herald to Carthage with a letter to the senate and people, telling them, that if they did not immediately withdraw their garrisons from all the Greek cities in Sicily, the people of Syracuse would treat them as enemies. With this demand, however, he did not al-

low them to comply; for without waiting for any answer from Carthage, he advanced with his army to Mount Eryx, near which stood the city of Motya, a Carthaginian colony of great importance, and this he immediately invested. But soon after, leaving his brother Leptines to carry on the attacks, he himself went with the greatest part of his forces to reduce the cities in alliance with the Carthaginians. He destroyed their territories with fire and sword, cut down all their trees; and then he sat down before Egesta and Entella, most of the other towns having opened their gates at his approach: but these baffling his utmost efforts, he returned to Motya, and pushed on the siege of that place with the utmost vigour.

The Carthaginians, in the mean time, though alarmed at the message sent them by Dionysius, and though reduced to a miserable situation by the plague which had broke out in their city, did not despond, but sent officers to Europe, with considerable sums, to raise troops with the utmost diligence. Ten galleys were also sent from Carthage to destroy all the ships that were found in the harbour of Syracuse. The admiral, according to his orders, entered the harbour in the night, without being discerned by the enemy; and having sunk most of the ships he found there, returned without the loss of a man.

21
Syracusan
ships de-
stroyed.

All this while the Motyans defended themselves with incredible vigour; while their enemies, desirous of revenging the cruelties exercised upon their countrymen by the Carthaginians, fought like lions. At last the place was taken by storm, and the Greek soldiers began a general massacre. For some time Dionysius was not able to restrain their fury: but at last he proclaimed that the Motyans should fly to the Greek temples; which they accordingly did, and a stop was put to the slaughter; but the soldiers took care thoroughly to plunder the town, in which they found a great treasure.

22
Motya ta-
ken by the
Greeks.

The following spring, Dionysius invaded the Carthaginian territories, and made an attempt upon Egesta; but here he was again disappointed. The Carthaginians were greatly alarmed at his progress; but, next year, notwithstanding a considerable loss sustained in a sea-fight with Leptines, Himilco their general landed a powerful army at Panormus, seized upon Eryx, and then advancing towards Motya, made himself master of it, before Dionysius could send any forces to its relief. He next advanced to Messana, which he likewise besieged and took; after which most of the Siculi revolted from Dionysius.

Notwithstanding this defection, Dionysius, finding his forces still amount to 30,000 foot and 3000 horse, advanced against the enemy. At the same time, Leptines was sent with the Syracusan fleet against that of the Carthaginians, but with positive orders not to break the line of battle upon any account whatever. But, notwithstanding these orders, he thought proper to divide his fleet, and the consequence of this was a total defeat; above 100 of the Syracusan galleys being sunk or taken, and 20,000 of their men killed in the battle or in the pursuit. Dionysius disheartened by this misfortune, returned with his army to Syracuse, being afraid that the Carthaginian fleet might become masters of that city, if he should advance to fight the land army. Himilco did not fail immediately to invest the

ginians.

Carthage. capital; and had certainly become master of it, and consequently of the whole island, had not a most malignant pestilence obliged him to desist from all further operations. This dreadful malady made great havock among his forces both by sea and land; and to complete his misfortunes, Dionysius attacked him unexpectedly, totally ruined his fleet, and made himself master of his camp.

25
Hamilco
obliged to
return.

Hamilco finding himself altogether unable to sustain another attack, was obliged to come to a private agreement with Dionysius; who for 300 talents consented to let him escape to Africa, with the shattered remains of his fleet and army. The unfortunate general arrived at Carthage, clad in mean and sordid attire, where he was met by a great number of people bewailing their sad and inauspicious fortune. Hamilco joined them in their lamentations; and being unable to survive his misfortunes, put an end to his own life. He had left Mago in Sicily, to take care of the Carthaginian interests in the best manner he could. In order to this, Mago treated all the Sicilians subject to Carthage with the greatest humanity; and having received a considerable number of soldiers from Africa, he at last formed an army with which he ventured a battle: in this he was defeated, and driven out of the field, with the loss of 800 men; which obliged him to desist from farther attempts of that nature.

26
Another
invasion of
Sicily.

Notwithstanding all these terrible disasters, the Carthaginians could not forbear making new attempts upon the island of Sicily; and about the year before Christ 392, Mago landed in it with an army of 80,000 men. This attempt, however, was attended with no better success than before; Dionysius found means to reduce him to such straits for want of provisions, that he was obliged to sue for peace. This continued for nine years, at the end of which the war was renewed with various success. It continued with little interruption till the year before Christ 367, when, the Syracusan state being rent by civil dissensions, the Carthaginians thought it a proper time to exert themselves, in order to become masters of the whole island. They fitted out a great fleet, and entered into alliance with Icetas, tyrant of Leontini, who pretended to have taken Syracuse under his protection. By this treaty, the two powers engaged to assist each other, in order to expel Dionysius II. after which they were to divide the island between them. The Syracusians applied for succours to the Corinthians; and they readily sent them a body of troops under the command of Timoleon an experienced general. By a stratagem, he got his forces landed at Taurominium. The whole of them did not exceed 1200 in number: yet with these he marched against Icetas, who was at the head of 5000 men; his army he surprised at supper, put 300 of them to the sword, and took 600 prisoners. He then marched to Syracuse, and broke into one part of the town before the enemy had any notice of his approach: here he took post, and defended himself with such resolution, that he could not be dislodged by the united power of Icetas and the Carthaginians.

28
Foolish con-
duct of the
Carthagini-
an admiral.

In this place he remained for some time, in expectation of a reinforcement from Corinth; till the arrival of which, he did not judge it practicable to extend

his conquests.—The Carthaginians being apprised that the Corinthian succours were detained by tempestuous weather at Thurium, posted a strong squadron, under Hanno their admiral, to intercept them in their passage to Sicily. But that commander, not imagining the Corinthians would attempt a passage to Sicily in such a stormy season, left his station at Thurium, and ordering his seamen to crown themselves with garlands, and adorn their vessels with bucklers both of the Greek and Carthaginian form, sailed to Syracuse in a triumphant manner. Upon his arrival there, he gave the troops in the citadel to understand, that he had taken the succours Timoleon expected, thinking by this means to intimidate them to surrender. But, while he thus trifled away his time, the Corinthians marched with great expedition to Rhegium, and, taking the advantage of a gentle breeze, were easily wafted over into Sicily. Mago, the Carthaginian general, was no sooner informed of the arrival of this reinforcement, than he was struck with terror, though the whole Corinthian army did not exceed 4000 men; and, soon after, fearing a revolt of his mercenaries, he weighed anchor, in spite of all the remonstrances of Icetas, and set sail for Africa. Here he no sooner arrived, than, overcome with grief and shame for his unparalleled cowardice, he laid violent hands on himself. His body was hung upon a gallows or cross, in order to deter succeeding generals from forfeiting their honour in so flagrant a manner.

Carthage.

29
Cowardice
of Mago.

After the flight of Mago, Timoleon carried all before him. He obliged Icetas to renounce his alliance with the state of Carthage, and even deposed him, and continued his military preparations with the greatest vigour. On the other hand, the Carthaginians prepared for the ensuing campaign with the greatest alacrity. An army of 70,000 men was sent over, with a fleet of 200 ships of war, and 1000 transports laden with warlike engines, armed chariots, horses, and all other sorts of provisions. This immense multitude, however, was overthrown on the banks of the Crimæsus by Timoleon: 10,000 were left dead on the field of battle; and of these, above 3000 were native Carthaginians of the best families in the city. Above 15,000 were taken prisoners; all their baggage and provisions, with 200 chariots, 1000 coats of mail, and 10,000 shields, fell into Timoleon's hands. The spoil, which consisted chiefly of gold and silver, was so immense, that the whole Sicilian army was three days in collecting it and stripping the slain. After this signal victory, he left his mercenary forces upon the frontiers of the enemy, to plunder and ravage the country; while he himself returned to Syracuse with the rest of his army, where he was received with the greatest demonstrations of joy. Soon after, Icetas, grown weary of his private station, concluded a new peace with the Carthaginians; and, having assembled an army, ventured an engagement with Timoleon: but in this he was utterly defeated; and himself, with Eupolemus his son, and Euthymus general of his horse, were brought bound to Timoleon by their own soldiers. The two first were immediately executed as tyrants and traitors, and the last murdered in cold blood; Icetas's wives and daughters were likewise cruelly put to death after a public trial. In a short time after, Mamercus, another of the Carthaginian confederates, was

30
Exploits of
Timoleon.

OVER

³¹ Carthage. overthrown by Timoleon, with the loss of 2000 men. These misfortunes induced the Carthaginians to conclude a peace on the following terms: That all the Greek cities should be set free; that the river Halycus should be the boundary between the territories of both parties; that the natives of the cities subject to the Carthaginians should be allowed to withdraw, if they pleased, to Syracuse, or its dependencies, with their families and effects; and lastly, that Carthage should not, for the future, give any assistance to the remaining tyrants against Syracuse.

³² War renewed.

About 316 years before Christ, we find the Carthaginians engaged in another bloody war with the Sicilians, on the following occasion. Sosistratus, who had usurped the supreme authority at Syracuse, having been forced by Agathocles to raise the siege of Rhegium, returned with his shattered troops to Sicily. But soon after this unsuccessful expedition, he was obliged to abdicate the sovereignty and quit Syracuse. With him were expelled above 600 of the principal citizens, who were suspected of having formed a design to overturn the plan of government which then prevailed in the city. As Sosistratus and the exiles thought themselves ill treated, they had recourse to the Carthaginians, who readily espoused their cause. Hereupon the Syracusians having recalled Agathocles, who had before been banished by Sosistratus, appointed him commander in chief of all their forces, principally on account of the known aversion he bore that tyrant. The war, however, did not then continue long; for Sosistratus and the exiles were quickly received again into the city, and peace was concluded with Carthage: the people of Syracuse, however, finding that Agathocles wanted to make himself absolute, exacted an oath from him, that he would do nothing to the prejudice of the democracy. But, notwithstanding this oath, Agathocles pursued his purpose, and by a general massacre of the principal citizens of Syracuse raised himself to the throne. For some time he was obliged to keep the peace he had concluded with Carthage; but at last finding his authority established, and that his subjects were ready to second his ambitious designs, he paid no regard to his treaties, but immediately made war on the neighbouring states, which he had expressly agreed not to do, and then carried his arms into the very heart of the island. In these expeditions he was attended with such success, that in two years time he brought into subjection all the Greek part of Sicily. This being accomplished, he committed great devastations in the Carthaginian territories, their general Hamilcar not offering to give him the least disturbance. This perfidious conduct greatly incensed the people of those districts against Hamilcar, whom they accused before the senate. He died, however, in Sicily; and Hamilcar the son of Gisco was appointed to succeed him in the command of the forces. The last place that held out against Agathocles was Messina, whither all the Syracusan exiles had retired. Pasiphilus, Agathocles's general, found means to cajole the inhabitants into a treaty; which Agathocles, according to custom, paid no regard to, but, as soon as he was in possession of the town, cut off all those who had opposed his government. For, as he intended to prosecute the war with the utmost vigour against Carthage, he thought it a

Nº 65.

point of good policy to destroy as many of his Sicilian enemies as possible.

The Carthaginians in the mean time having landed a powerful army in Sicily, an engagement soon ensued, in which Agathocles was defeated with the loss of 7000 men. After this defeat he was obliged to shut himself up in Syracuse, which the Carthaginians immediately invested, and most of the Greek states in the island submitted to them.

Agathocles seeing himself stripped of almost all his dominions, and his capital itself in danger of falling into the hands of the enemy, formed a design which, were it not attested by writers of undoubted authority, would seem absolutely incredible. This was no less than to transfer the war into Africa, and lay siege to the enemy's capital, at a time when he himself was besieged, and only one city left to him in all Sicily. Before he departed, however, he made all the necessary preparations for the defence of the place, and appointed his brother Antandrus governor of it. He also gave permission to all who were not willing to stand the fatigues of a siege to retire out of the city. Many of the principal citizens, Justin says 1600, accepted of this offer; but they were no sooner got out of the place, than they were cut off by parties posted on the road for that purpose. Having seized upon their estates, Agathocles raised a considerable sum, which was intended in some measure to defray the expence of the expedition; however, he carried with him only 50 talents to supply his present wants, being well assured that he should find in the enemy's country whatever was necessary for his subsistence. As the Carthaginians had a much superior fleet, they for some time kept the mouth of the harbour blocked up; but at last a fair opportunity offered; and Agathocles hoisting sail, by the activity of his rowers soon got clear both of the port and city of Syracuse. The Carthaginians pursued him with all possible expedition; but, notwithstanding their utmost efforts, Agathocles got his troops landed with very little opposition.

Soon after his forces were landed, Agathocles burnt his fleet, probably that his soldiers might behave with the greater resolution, as they saw no possibility of flying from their danger. He first advanced to a place called the Great City. This, after a feeble resistance, he took and plundered. From hence he marched to Tunis, which surrendered on the first summons; and Agathocles levelled both places with the ground.

The Carthaginians were at first thrown into the greatest consternation; but soon recovering themselves, the citizens took up arms with so much alacrity, that in a few days they had on foot an army of 40,000 foot and 1000 horse, with 2000 armed chariots. The command of this army they entrusted to Hanno and Bomilcar, two generals between whom there subsisted a great animosity. This occasioned the defeat of their whole army with the loss of their camp, though all the forces of Agathocles did not exceed 14,000 in number. Among other rich spoils the conqueror found 20,000 pair of fetters and manacles that the enemy had provided for the Sicilian prisoners. After this defeat, the Carthaginians, supposing themselves to have fallen under the displeasure of their deities on account of their neglecting to sacrifice children of noble families

39
Hamilcar
makes an
assault on
Syracuse.

After these expiations, Hamilcar was recalled from Sicily. When the messengers arrived, Hamilcar commanded them not once to mention the victory of Agathocles; but, on the contrary, to give out among the troops that he had been entirely defeated, his forces all cut off, and his fleet destroyed by the Carthaginians. This threw the Syracusians into the utmost despair; however, one Eurymnon, an Etolian, prevailed upon Antandrus, not to consent to a capitulation, but to stand a general assault. Hamilcar being informed of this, prepared his battering engines, and made all the necessary preparations to storm the town without delay. But while matters remained in this situation, a galley, which Agathocles had caused to be built immediately after the battle, got into the harbour of Syracuse, and acquainted the inhabitants with the certainty of Agathocles's victory. Hamilcar observing that the garrison flocked down to the port on this occasion, and expecting to find the walls unguarded, ordered his soldiers to erect scaling-ladders, and begin the intended assault. The enemy having left the ramparts quite exposed, the Carthaginians mounted them without being discerned, and had almost possessed themselves of an entire part lying between two towers, when the patrol discovered them. Upon this a warm dispute ensued; but at last the Carthaginians were repulsed with loss. Hamilcar, therefore, finding it in vain to continue the siege after such glad tidings had restored life and soul to the Syracusians, drew off his forces, and sent a detachment of 5000 men to reinforce the troops in Africa. He still entertained hopes, however, that he might oblige Agathocles to quit Africa, and return to the defence of his own dominions. He spent some time in making himself master of such cities as sided with the Syracusians; and after having brought all their allies under subjection, returned again to Syracuse, hoping to surprise it by an attack in the night-time. But being attacked while advancing thro' narrow passes, where his numerous army had not room to act, he was defeated with great slaughter, and himself taken prisoner, carried into Syracuse, and put to death.

43
Success of
Agathocles
in Africa.

In the mean time the Agrigentines, finding that the Carthaginians and Syracusians had greatly weakened each other by this war, thought it a proper opportunity to attempt the sovereignty of the whole island. They therefore commenced a war against both parties; and prosecuted it with such success, that in a short time they wrested many places of note both out of the hands of the Syracusians and Carthaginians.

In Africa the tyrant carried every thing before him. He reduced most of the places of any note in the territory of Carthage; and hearing that Elymas king of Libya had declared against him, he immediately entered Libya Superior, and in a great battle overthrew that prince, putting to the sword a good part of his troops, and the general who commanded them; after which he advanced against the Carthaginians with such expedition, that he surprised and de-

Vol. IV. Part I.

feated them, with the loss of 2000 killed, and a great number taken prisoners. He next prepared for the siege of Carthage itself; and in order thereto advanced to a post within five miles of that city. On the other hand, notwithstanding the great losses they had already sustained, the Carthaginians, with a powerful army, encamped between him and their capital. In this situation Agathocles received advice of the defeat of the Carthaginian forces before Syracuse, and the head of Hamilcar their general. Upon this he immediately rode up to the enemy's camp, and showing them the head, gave them an account of the total destruction of their army before Syracuse. This threw them into such consternation, that in all human probability Agathocles would have made himself master of Carthage, had not an unexpected mutiny arisen in his camp, which gave the Carthaginians an opportunity of recovering from their terror.

The year following an engagement happened, in which neither party gained any great advantage: but soon after, the tyrant, notwithstanding all his victories, found himself unable to carry on the war alone; and therefore endeavoured to gain over to his interest Ophellas, one of the captains of Alexander the Great. In this he perfectly succeeded; and, to succour his new ally the more effectually, Ophellas sent to Athens for a body of troops. Having finished his military preparations, Ophellas found his army to consist of 10,000 foot and 600 horse, all regular troops, besides 100 chariots, and a body of 10,000 men, attended by their wives and children, as though he had been going to plant a new colony. At the head of these forces he continued his march towards Agathocles for 18 days; and then encamped at Automolæ, a city about 3000 stadia distant from the capital of his dominions. From thence he advanced through the Regio Syrtica; but found himself reduced to such extremities, that his army was in danger of perishing for want of bread, water, and other provisions. They were also greatly annoyed by serpents and wild beasts, with which that desert region abounded. The serpents made the greatest havock among the troops; for, being of the same colour with the earth, and extremely venomous, many soldiers, who trod upon them without seeing them, were stung to death. At last, after a very fatiguing march of two months, he approached Agathocles, and encamped at a small distance from him, to the no small terror of the Carthaginians, who apprehended the most fatal consequences from this junction. Agathocles at first caressed him, and advised him to take all possible care of his troops that had undergone so many fatigues; but soon after cut him off by treachery, and then by fair words and promises persuaded his troops to serve under himself.

Agathocles now finding himself at the head of a numerous army, assumed the title of King of Africa, intending soon to complete his conquests by the reduction of Carthage. He began with the siege of Utica, which was taken by assault. After this he marched against Hippo Diarrhytus, the Biferta of the moderns, which was also taken by storm; and after this most of the people bordering upon the sea-coasts, and even those who inhabited the inland parts of the country, submitted to him. But in the midst of this career of success, the Sicilians formed an association in

Carthage. favour of liberty; which obliged the tyrant to return home, leaving his son Archagathus to carry on the war in Africa.

47
Success of
Archaga-
thus.

Archagathus, after his father's departure, greatly extended the African conquests. He sent Eumachus at the head of a large detachment to invade some of the neighbouring provinces, while he himself, with the greatest part of his army, observed the motions of the Carthaginians. Eumachus falling into Numidia, first took the great city of Tocas, and conquered several of the Numidian cantons. Afterwards he besieged and took Phellina; which was attended with the submission of the Asphodelodians, a nation, according to Diodorus, as black as the Ethiopians. He then reduced several cities; and being at last elated with such a run of good fortune, resolved to penetrate into the more remote parts of Africa. Here he at first met with success; but hearing that the barbarous nations were advancing in a formidable body to give him battle, he abandoned his conquests, and retreated with the utmost precipitation towards the sea-coasts, after having lost abundance of men.

48
He is reduced to the
utmost distress.

This unfortunate expedition made a great alteration for the worse in the affairs of Archagathus. The Carthaginians being informed of Eumachus's bad success, resolved to exert themselves in an extraordinary manner to repair their former losses. They divided their forces into three bodies: one of these they sent to the sea-coasts, to keep the towns there in awe; another they dispatched into the Mediterranean parts, to preserve the allegiance of the inhabitants there; and the last body they ordered to the Upper Africa, to support their confederates in that country. Archagathus being apprised of the motions of the Carthaginians, divided his forces likewise into three bodies. One of these he sent to observe the Carthaginian troops on the sea-coasts, with orders to advance afterwards into the Upper Africa; another, under the command of Æschrius, one of his generals, he posted at a proper distance in the heart of the country, to have an eye both on the enemy there and the barbarous nations; and with the last, which he led in person, he kept nearer Carthage, preserving a communication with the other two, in order to send them succours, or recal them, as the exigency of affairs should require.—The Carthaginian troops sent into the heart of the country, were commanded by Hanno, a general of great experience, who being informed of the approach of Æschrius, laid an ambuscade for him, into which he was drawn and cut off with 4000 foot and 200 horse. Himilco, who commanded the Carthaginian forces in Upper Africa, having advice of Eumachus's march, immediately advanced against him. An engagement ensued, in which the Greeks were almost totally cut off, or perished with thirst after the battle, out of 8000 foot only 30, and of 800 horse only 40, having the good fortune to make their escape.

Archagathus receiving the melancholy news of these two defeats, immediately called in the detachments he had sent out to harass the enemy, which would otherwise have been instantly cut off. He was, however, in a short time hemmed in on all sides in such a manner as to be reduced to the last extremity for want of provisions, and ready every moment to

be swallowed up by the numerous forces which surrounded him. In this deplorable situation Agathocles received an express from Archagathus, acquainting him of the losses he had sustained and the scarcity of provisions he laboured under. Upon this the tyrant, leaving the care of the Sicilian war to one Leptines, by a stratagem got 18 Etruscan ships that came to his assistance out of the harbour; and then engaging the Carthaginian squadron which lay in its neighbourhood, took five of their ships, and made all their men prisoners. By this means he became master of the port, and secured a passage into it for the merchants of all nations, which soon restored plenty to that city, where the famine before had begun to make great havock. Supplying himself, therefore, with a sufficient quantity of necessaries for the voyage he was going to undertake, he immediately set sail for Africa.

Upon his arrival in this country, Agathocles reviewed his forces, and found them to consist of 6000 Greeks, as many Samnites, Celtes, and Etruscans; besides 10,000 Africans, and 1500 horse. As he found his troops almost in a state of despair, he thought this a proper time for offering the enemy battle. The Carthaginians, however, did not think proper to accept the challenge; especially as by keeping close in their camp, where they had plenty of every thing, they could starve the Greeks to a surrender without striking a stroke. Upon this Agathocles attacked the Carthaginian camp with great bravery, made a considerable impression upon it, and might perhaps have carried it, had not his mercenaries deserted him almost at the first onset. By this piece of cowardice he was forced to retire with precipitation to his camp, whither the Carthaginians pursued him very closely, doing great execution in the pursuit.

The next night, the Carthaginians sacrificed all the prisoners of distinction as a grateful acknowledgment to the gods for the victory they had gained. While they were employed in this inhuman work, the wind, suddenly rising, carried the flames to the sacred tabernacle near the altar, which was entirely consumed, as well as the general's tent, and those of the principal officers adjoining to it. A dreadful alarm took place through the whole camp, which was heightened by the great progress the fire made. For the soldiers tents consisting of very combustible materials, and the wind blowing in a most violent manner, the whole camp was almost entirely laid in ashes; and many of the soldiers endeavouring to carry off their arms, and the rich baggage of their officers, perished in the flames. Some of those who made their escape met with a fate equally unhappy: For, after Agathocles had received the last blow, the Africans deserted him, and were in that instant coming over in a body to the Carthaginians. These, the persons who were flying from the flames took to be the whole Syracusan army advancing in order of battle to attack their camp. Upon this a dreadful confusion ensued. Some took to their heels; others fell down in heaps one upon another; and others engaged their comrades, mistaking them for the enemy. Five thousand men lost their lives in this tumult, and the rest thought proper to take refuge within the walls of Carthage; nor could the appearance of day-light, for some time, dissipate

sipate their terrible apprehensions. In the mean time, the African deserters, observing the great confusion the Carthaginians were in, and not knowing the meaning of it, were so terrified, that they thought proper to return to the place from whence they came. The Syracusians seeing a body of troops advancing towards them in good order, concluded that the enemy were marching to attack them, and therefore immediately cried out "To arms." The flames ascending out of the Carthaginian camp into the air, and the lamentable outcries proceeding from thence, confirmed them in this opinion, and greatly heightened their confusion. The consequence was much the same as in the Carthaginian camp; for coming to blows with one another instead of the enemy, they scarce recovered their senses upon the return of light, and the intestine fray was so bloody, that it cost Agathocles 4000 men.

53
He escapes
privately.

This last disaster so disheartened the tyrant, that he immediately set about contriving means for making his escape privately; and this he at last, though with great difficulty, effected. After his departure, his two sons were immediately put to death by the soldiers, who, choosing a leader from among themselves, made peace with the Carthaginians upon the following conditions: 1. That the Greeks should deliver up all the places they held in Africa, receiving from them 300 talents; 2. That such of them as were willing to serve in the Carthaginian army should be kindly treated, and receive the usual pay; and, 3. That the rest should be transported to Sicily, and have the city of Selinus for their habitation.

54
Causes of
the first
Punic War.

From this time, to that of their first war with the Romans, we find nothing remarkable in the history of the Carthaginians. The first Punic war, as it is commonly called, happened about 256 years before Christ. At that time, the Carthaginians were possessed of extensive dominions in Africa; they had made considerable progress in Spain; were masters of Sardinia, Corsica, and all the islands on the coast of Italy; and had extended their conquests to a great part of Sicily. The occasion of the first rupture between the two republics was as follows. The Mamertines being vanquished in battle, and reduced to great straits by Hiero king of Syracuse, had resolved to deliver up Messina, the only city they now possessed, to that prince, with whose mild government and strict probity they were well acquainted. Accordingly, Hiero was advancing at the head of his troops to take possession of the city, when Hannibal, who at that time commanded the Carthaginian army in Sicily, prevented him by a stratagem. He came to meet Hiero, as it were to congratulate him on his victory; and amused him, while some of the Carthaginian troops filed off towards Messina. Hereupon the Mamertines, seeing their city supported by a new reinforcement, were divided into several opinions. Some were for accepting the protection of Carthage; others were for surrendering to the king of Syracuse; but the greater part were for calling in the Romans to their assistance. Deputies were accordingly dispatched to Rome, offering the possession of the city to the Romans, and in the most moving terms imploring protection. This, after some debate, was agreed to;

Carthage.

and the consul Appius Claudius received orders to attempt a passage to Sicily, at the head of a powerful army. Being obliged to stay some time at Rome, however, one Caius Claudius, a person of great intrepidity and resolution, was dispatched with a few vessels to Rhegium. On his arrival there, he observed the Carthaginian squadron to be so much superior to his own, that he thought it would be little better than madness to attempt at that time to transport forces to Sicily. He crossed the straits, however, and had a conference with the Mamertines, in which he prevailed upon them all to accept of the protection of Rome; and on this he made the necessary preparations for transporting his forces. The Carthaginians being informed of the resolutions of the Romans, sent a strong squadron of galleys under the command of Hanno, to intercept the Roman fleet; and accordingly the Carthaginian admiral, coming up with them near the coast of Sicily, attacked them with great fury. During the engagement, a violent storm arose, which dashed many of the Roman vessels against the rocks, and did a vast deal of damage to their squadron; by which means Claudius was forced to retire to Rhegium, and this he accomplished with great difficulty. Hanno restored all the vessels he had taken; but ordered the deputies sent with them, to expostulate with the Roman general upon the infraction of the treaties subsisting between the two republics. This expostulation, however just, produced an open rupture; Claudius soon after possessing himself of Messina.

55
Hanno in-
tercepts the
Roman
fleet.

Such was the beginning of the first Punic war, which is said to have lasted 24 years. The first year, the Carthaginians and Syracusians laid siege to Messina; but, not acting in concert as they ought to have done, they were overthrown by the Consul Appius Claudius; and this defeat so much disgusted Hiero with the Carthaginians, that he soon after concluded an alliance with the Romans. After this treaty, having no enemy to contend with but the Carthaginians, the Romans made themselves masters of all the cities on the western coast of Sicily, and at the end of the campaign carried back most of their troops with them to take up their winter-quarters in Italy.

56
Carthagini-
ans and Sy-
racusians
defeated by
the Ro-
mans.

The second year, Hanno the Carthaginian general fixed his principal magazine at Agrigentum. This place was very strong by nature, had been rendered almost impregnable by the new fortifications raised by the Carthaginians during the preceding winter, and was defended by a numerous garrison commanded by one Hannibal, a general of great experience in war. For five months the Romans attempted to reduce the place by famine, and had actually brought the inhabitants to great distress, when a Carthaginian army of 50,000 foot, 6000 horse, and 60 elephants, landed at Lilybæum, and from thence marched to Heraclea, within 20 miles of Agrigentum. There the general received a deputation from some of the inhabitants of Erbesia, where the Romans had their magazines, offering to put the town into his hands. It was accordingly delivered up; and by this means the Romans became so much distressed; that they had certainly been obliged to abandon their enterprize, had not Hiero supplied them with provisions. But all the assistance he was able to give could not long have supported them,

57

mans.

Carthage. them, as their army was so much weakened by disorders occasioned by famine, that, out of 100,000 men of whom it originally consisted, scarce a fourth part remained fit for service, and could no longer subsist on such parsimonious supplies. But in the mean time Hannibal acquainted Hanno that the city was reduced to the utmost distress; upon which he resolved to venture an engagement, which he had before declined. In this the Romans were victorious, and the city surrendered at discretion, though Hannibal with the greatest part of the garrison made their escape. This ended the campaign; and the Carthaginians being greatly chagrined at their bad success, fined Hanno of an immense sum of money, and deprived him of his command, appointing Hamilcar to succeed him in the command of the land army, and Hannibal in that of the fleet.

58 They build a fleet, The third year, Hannibal received orders to ravage the coasts of Italy; but the Romans had taken care to post detachments in such places as were most proper to prevent his landing, so that the Carthaginian found it impossible to execute his orders. At the same time, the Romans, perceiving the advantages of being masters of the sea, set about building 120 galleys. While this was doing, they made themselves masters of most of the inland cities, but the Carthaginians reduced or kept steady in their interest most of the maritime ones; so that both parties were equally successful during this campaign.

59 And defeat the Carthaginians at sea. The fourth year, Hannibal by a stratagem made himself master of 17 Roman galleys; after which he committed great ravages on the coast of Italy, whither he had advanced to take a view of the Roman fleet. But he was afterwards attacked in his turn, lost the greatest part of his ships, and with great difficulty made his own escape. Soon after he was totally defeated by the consul Duillius, with the loss of 80 ships taken, thirteen sunk, 7000 men killed, and as many taken prisoners. After this victory Duillius landed in Sicily, put himself at the head of the land forces, relieved Segesta besieged by Hamilcar, and made himself master of Macella, though defended by a numerous garrison.

60 Sicilians defeated by the Carthaginians. The fifth year, a difference arose between the Romans and their Sicilian allies, which came to such an height, that they encamped separately. Of this Hamilcar availed himself, and attacking the Sicilians in their entrenchments, put 4000 of them to the sword. He then drove the Romans from their posts, took several cities from them, and over-ran the greatest part of the country. In the mean time, Hannibal, after his defeat, sailed with the shattered remains of his fleet to Carthage: but in order to secure himself from punishment, he sent one of his friends with all speed, before the event of the battle was known there, to acquaint the senate, that the Romans had put to sea with a good number of heavy ill-built vessels, each of them carrying some machine, the use of which the Carthaginians did not understand; and asked whether it was the opinion of the senate that Hannibal should attack them. These machines were the *corvi*, which were then newly invented, and by means of which, chiefly, Duillius had gained the victory. The senate were unanimous in their opinion, that the Romans should be attacked; upon which the

messenger acquainted them with the unfortunate event of the battle. As the senators had already declared themselves for the engagement, they spared their general's life, and, according to Polybius, even continued him in the command of the fleet. In a short time, being reinforced by a good number of galleys, and attended by some officers of great merit, he sailed for the coast of Sardinia. He had not been long here, before he was surprised by the Romans, who carried off many of his ships, and took great numbers of his men prisoners. This so incensed the rest, that they seized their unfortunate admiral, and crucified him; but who was his immediate successor does not appear.

61 The sixth year, the Romans made themselves masters of the islands of Corsica and Sardinia. Hanno, who commanded the Carthaginian forces in the latter, defended himself at a city called Olbia with incredible bravery; but being at last killed in one of the attacks, the place was surrendered, and the Romans soon became masters of the whole island.

62 The seventh year, the Romans took the town of Mytestratum, in Sicily, from whence they marched towards Camarina, but in their way were surrounded in a deep valley, and in the most imminent danger of being cut off by the Carthaginian army. In this extremity, a legionary tribune, by name *M. Calpurnius Flamma*, desired the general to give him 300 chosen men; promising, with this small company, to find the enemy such employment as should oblige them to leave a passage open for the Roman army. He performed his promise with a bravery truly heroic; for, having seized, in spite of all opposition, an eminence, and entrenched himself on it, the Carthaginians, jealous of his design, flocked from all quarters to drive him from his post. But the brave tribune kept their whole army in play, till the consul, taking advantage of the diversion, drew his army out of the bad situation in which he had imprudently brought it. The legions were no sooner out of danger, than they hastened to the relief of their brave companions: but all they could do was to save their bodies from the insults of their enemies; for they found them all dead on the spot, except Calpurnius, who lay under an heap of dead bodies all covered with wounds, but still breathing. His wounds were immediately dressed, and it fortunately happened that none of them proved mortal; and for this glorious enterprise he received a crown of *gramen*. After this the Romans reduced several cities, and drove the enemy quite out of the territory of the Agrigentines; but were repulsed with great loss before Lipara.

63 Rescued by the bravery of a legionary tribune. The eighth year, Regulus, who commanded the Roman fleet, observing that of the Carthaginians lying along the coast in disorder, sailed with a squadron of ten galleys to observe their number and strength, ordering the rest of the fleet to follow him with all expedition. But as he drew too near the enemy, he was surrounded by a great number of Carthaginian galleys. The Romans fought with their usual bravery; but, being overpowered with numbers, were obliged to yield. The consul, however, found means to make his escape, and join the rest of the fleet; and then had his full revenge of the enemy, 18 of their ships being taken, and eight sunk.

64 The ninth year, the Romans made preparations for invading

Carthage. invading Africa. Their fleet for this purpose consisted of 330 galleys, each of them having on board 120 foldiers and 300 rowers. The Carthaginian fleet consisted of 360 sail, and was much better manned than that of the Romans. The two fleets met near Ecnomus, a promontory in Sicily; where, after a bloody engagement which lasted the greater part of the day, the Carthaginians were entirely defeated, with the loss of 30 galleys sunk, and 63 taken with all their men. The Romans lost only 24 galleys, which were all sunk.—After this victory, the Romans having refitted their fleet, set sail for the coast of Africa with all expedition. The first land they got sight of was Cape Hermea, where the fleet lay at anchor for some time waiting till the galleys and transports came up. From thence they coasted along till they arrived before Clupea, a city to the east of Carthage, where they made their first descent.

65. Regulus invades Africa.
66. Carthaginians in great consternation.
No words can express the consternation of the Carthaginians, on the arrival of the Romans in Africa. The inhabitants of Clupea were so terrified, that, according to Zonaras, they abandoned the place, which the Romans immediately took possession of. Having left there a strong garrison to secure their shipping, and keep the adjacent territory in awe, they moved nearer Carthage, taking a great number of towns; they likewise plundered a prodigious number of villages, laid vast numbers of noblemens seats in ashes, and took above 20,000 prisoners. In short, having plundered and ravaged the whole country, almost to the gates of Carthage, they returned to Clupea laden with the immense booty they had acquired in the expedition.

67. Success of Regulus.
The tenth year, Regulus pushed on his conquests with great rapidity. To oppose his progress, Hamilcar was recalled from Sicily, and with him Bostar and Asdrubal were joined in command. Hamilcar commanded an army just equal to that of Regulus. The other two commanded separate bodies, which were to join him or act apart as occasion required. But, before they were in a condition to take the field, Regulus, pursuing his conquests, arrived on the banks of the *Bragada*, a river which empties itself into the sea at a small distance from Carthage. Here he had a

68. He kills a monstrous serpent.
monstrous serpent to contend with, which, according to the accounts of those days, infected the waters of the river, poisoned the air, and killed all other animals with its breath alone. When the Romans went to draw water, this huge dragon attacked them; and, twisting itself round their bodies, either squeezed them to death, or swallowed them alive. As its hard and thick scales were proof against their darts and arrows, they were forced to have recourse to the balistæ, which they made use of in sieges to throw great stones, and to beat down the walls of besieged cities. With these they discharged showers of huge stones against this new enemy, and had the good luck, with one of them, to break his back-bone; which disabled him from twisting and winding his immense body, and by that means gave the Romans an opportunity of approaching and dispatching him with their darts. But his dead body corrupted the air and the water of the river; and spread so great an infection over the whole country, that the Romans were obliged to decamp. We are told that Regulus sent to Rome the skin of

this monster, which was 120 feet long; and that it was hung up in a temple, where it was preserved to the time of the Numantine war.

69. Defeats the Carthaginians.
Having passed this river, he besieged *Adis*, or *Adda*, not far from Carthage, which the enemy attempted to relieve; but as they lay encamped among hills and rocks, where their elephants, in which the main strength of their army consisted, could be of no use, Regulus attacked them in their camp, killed 17,000 of them, and took 5000 prisoners, and 18 elephants. Upon the fame of this victory, deputations came from all quarters, infomuch that the conqueror in a few days became master of 80 towns; among which were the city and port of Utica. This increased the alarm at Carthage; which was reduced to despair, when Regulus laid siege to Tunis, a great city about nine miles from the capital. The place was taken in sight of the Carthaginians, who, from their walls, beheld all the operations of the siege, without making the least attempt to relieve it. And to complete their misfortunes, the Numidians, their neighbours, and implacable enemies, entered their territories, committing every where the most dreadful devastations, which soon occasioned a great scarcity of provisions in the city. The public magazines were soon exhausted: and, as the city was full of selfish merchants, who took advantage of the public distress, to sell provisions at an exorbitant price, a famine ensued, with all the evils which attend it.

70. And reduces them to the utmost despair.
71. His proposals of peace rejected.
In this extremity Regulus advanced to the very gates of Carthage; and having encamped under the walls, sent deputies to treat of a peace with the senate. The deputies were received with inexpressible joy; but the conditions they proposed were such that the senate could not hear them without the greatest indignation. They were, 1. That the Carthaginians should relinquish all claims to Sardinia, Corsica, and Sicily. 2. That they should restore to the Romans all the prisoners they had taken from them since the beginning of the war. 3. That if they cared to redeem any of their own prisoners, they should pay so much a-head for them as Rome should judge reasonable. 4. That they should for ever pay the Romans an annual tribute. 5. That for the future they should fit out but one man of war for their own use, and 50 triremes to serve in the Roman fleet, at the expence of Carthage, when required by any of the future consuls. These extravagant demands provoked the senators, who loudly and unanimously rejected them; the Roman deputies, however, told them that Regulus would not alter a single letter of the proposals, and that they must either conquer the Romans or obey them.

72. Xanthippus appointed to command the Carthaginian army.
In this extreme distress, some mercenaries arrived from Greece, among whom was a Lacedemonian, by name Xanthippus, a man of great valour and experience in war. This man, having informed himself of the circumstances of the late battle, declared publicly, that their overthrow was more owing to their own misconduct than to the superiority of the enemy. This discourse being spread abroad, came at last to the knowledge of the senate; and by them, and even by the desire of the Carthaginian generals themselves, Xanthippus was appointed commander in chief of their forces. His first care was to discipline his troops in a proper

Carthage.

proper manner. He taught them how to march, encamp, widen and close their ranks, and rally after the Lacedemonian manner under their proper colours. He then took the field with 12,000 foot, 4000 horse, and 100 elephants. The Romans were surpris'd at the sudden alteration they observ'd in the enemy's conduct; but Regulus, elated with his last success, came and encamped at a small distance from the Carthaginian army in a vast plain, where their elephants and horse had room to act. The two armies were parted by a river, which Regulus boldly pass'd, by which means he left no room for a retreat in case of any misfortune. The engagement began with great fury; but ended in the total defeat of the Romans, who, except 2000 that escap'd to Clupea, were all killed or taken prisoners, and among the latter was Regulus himself. The loss of the Carthaginians scarce exceeded 800 men,

73
The Romans utterly defeated, and Regulus taken.

74
He is cruelly used.

75
Carthaginians defeated by sea and land.

The Carthaginians remained on the field of battle till they had stripp'd the slain; and then enter'd their metropolis, which was almost the only place left them, in great triumph. They treated all their prisoners with great humanity, except Regulus; but as for him, he had so insulted them in his prosperity, that they could not forbear shewing the highest marks of their resentment. According to Zonaras and others, he was thrown into a dungeon, where he had only sustenance allowed him barely sufficient to keep him alive. Nay, his cruel masters, to heighten his other torments, order'd an huge elephant (at the sight of which animal, it seems, he was greatly terrified) to be constantly plac'd near him; which prevent'd him from enjoying any tranquillity or repose.

The eleventh year of this war, the Carthaginians, elated with their victory over Regulus, began to talk in a very high strain, threatening Italy itself with an invasion. To prevent this, the Romans took care to garrison all their maritime towns, and fitted out a new fleet. In the mean time, the Carthaginians besieg'd Clupea and Utica in vain, being oblig'd to abandon their enterprize, upon hearing that the Romans were equipping a fleet of 350 sail. The Carthaginians having with incredible expedition refitted their old vessels, and built a good number of new ones, met the Roman fleet off Cape Hermea. An engagement ensued, in which the Carthaginians were utterly defeated; 104 of their ships being sunk, 30 taken, and 15,000 of their soldiers and rowers killed in the action. The Romans pursu'd their course to Clupea, where they were no sooner landed, than they found themselves attacked by the Carthaginian army, under the two Hanno's, father and son. But, as the brave Xanthippus no longer command'd their army, notwithstanding the Lacedemonian discipline he had introduc'd among them, they were rout'd at the very first onset, with the loss of 9000 men, and among them many of their chief lords.

76
Romans oblig'd to abandon Africa.

Notwithstanding all their victories, however, the Romans found themselves now oblig'd, for want of provisions, to evacuate both Clupea and Utica, and abandon Africa altogether. Being desirous of signaling the end of their consulate by some important conquest on Sicily, the consuls steer'd for that island, contrary to the advice of their pilots, who represent'd their danger, on account of the season being so far ad-

vanced. Their obstinacy prov'd the destruction of Carthage. the whole fleet; for a violent storm arising, out of 370 vessels, only 80 escap'd shipwreck, the rest being swallowed up by the sea, or dash'd against the rocks. This was by far the greatest loss that Rome had ever sustain'd; for besides the ships that were cast away with their crews, a numerous army was destroy'd, with all the riches of Africa, which had been by Regulus amass'd and deposited in Clupea, and were now from thence transporting to Rome. The whole coast from Pachinum to Camerina was cover'd with dead bodies and wrecks of ships; so that history can scarce afford an example of such a dreadful disaster.

The twelfth year, the Carthaginians hearing of this misfortune of the Romans, renew'd the war in Sicily with fresh fury, hoping the whole island, which was now left defenceless, would fall into their hands. Carthalo, a Carthaginian commander, besieg'd and took Agrigentum. The town he laid in ashes and demolish'd the walls, obliging the inhabitants to fly to Olympium. Upon the news of this success, Asdrubal was sent to Sicily with a large reinforcement of troops, and 150 elephants. They likewise fitted out a squadron, with which they retook the island of Cosyra, and march'd a strong body of forces into Mauritania and Numidia, to punish the people of those countries for shewing a disposition to join the Romans. In Sicily the Romans possess'd themselves of Cephalodium and Panormus, but were oblig'd by Carthalo to raise the siege of Drepanum with great loss.

77
Agrigentum taken and destroyed by the Carthaginians.

The 13th year, the Romans sent out a fleet of 260 galleys, which appear'd off Lilybæum in Sicily; but finding this place too strong, they steer'd from thence to the eastern coast of Africa, where they made several descents, surpris'd some cities, and plunder'd several towns and villages. They arriv'd safe at Panormus, and in a few days set sail for Italy, having a fair wind till they came off Cape Palinurus, where so violent a storm overtook them, that 160 of their galleys and a great number of their transports were lost; upon which the Roman senate made a decree, that, for the future, no more than 50 vessels should be equip'd; and that these should be employ'd only in guarding the coast of Italy, and transporting the troops into Sicily.

79
The Romans fit out a new fleet;

The 14th year, the Romans made themselves masters of Himera and Lipara in Sicily; and the Carthaginians conceiving new hopes of conquering that island, began to make fresh levies in Gaul and Spain, and to equip a new fleet. But their treasures being exhausted, they apply'd to Ptolemy king of Egypt, intreating him to lend them 2000 talents: but he being resolv'd to stand neuter, refus'd to comply with their request; telling them, that he could not without breach of fidelity assist one friend against another. However, the republic of Carthage making an effort, equip'd a fleet of 200 sail, and rais'd an army of 30,000 men, horse and foot, and 140 elephants, appointing Asdrubal commander in chief both of the fleet and army. The Romans then finding the great advantages of a fleet, resolv'd to equip one notwithstanding all former disasters; and while the vessels were building, two consuls were chosen, men of valour and experience, to supersede the acting ones in Sicily. Metellus, however, one of the former consuls, being continu'd with the title of proconsul, found

80
Which is again destroyed.

81
They fit out another.

means

Carthage. means to draw Asdrubal into a battle on disadvantageous terms near Panormus, and then sallying out upon him, gave him a most terrible overthrow. 82 Carthaginians utterly defeated. Twenty thousand of the enemy were killed, and many elephants. An hundred and four elephants were taken with their leaders, and sent to Rome, where they were hunted and put to death in the circus.

83 Lilybaeum besieged by the Romans. The 15th year, the Romans besieged Lilybaeum; and the siege continued during the rest of the first Punic war, and was the only thing remarkable that happened during that time*. The Carthaginians, on the first news of its being besieged, sent Regulus with some deputies to Rome to treat of a peace: but instead of forwarding the negociation, he hindered it; and notwithstanding he knew the torments prepared for him at Carthage, could not be prevailed upon to stay at Rome, but returning to his enemies country, was put to a most cruel death. During this siege, the Roman fleet under Claudius Pulcher was utterly defeated by Adherbal the Carthaginian admiral. Ninety of the Roman galleys were lost in the action, 8000 of their men either killed or drowned, and 20,000 taken and sent prisoners to Carthage; and the Carthaginians gained this signal victory without the loss of a single ship, or even a single man. Another Roman fleet met with a still severer fate. It consisted of 120 galleys, 800 transports, and was laden with all sorts of military stores and provisions. Every one of these vessels were lost by a storm, with all they contained, not a single plank being saved that could be used again; so that the Romans found themselves once more deprived of their whole naval force.

84 They are defeated at sea by the Carthaginians. 85 A Roman fleet utterly destroyed by a storm. In the mean time, the Carthaginian soldiery having shown a disposition to mutiny, the senate sent over Hamilcar Barcas, father of the famous Hannibal, to Sicily. He received a charte blanche from the senate to act as he thought proper; and by his excellent conduct and resolution, showed himself the greatest general of his age. He defended Eryx, which he had taken by surprise, with such vigour, that the Romans would never have been able to make themselves masters of it, had they not fitted out a new fleet at the expence of private citizens, which, having utterly defeated that of the Carthaginians, Hamilcar, notwithstanding all his valour, was obliged to yield up the place which he had so long and so bravely defended. The following articles of a peace were immediately drawn up between the two commanders. 1. The Carthaginians shall evacuate all the places which they have in Sicily, and entirely quit that island. 2. They shall, in 20 years, pay the Romans, at equal payments every year, 2200 talents of silver, that is, L. 437,250 Sterling. 3. They shall restore the Roman captives and deserters without ransom, and redeem their own prisoners with money. 4. They shall not make war upon Hiero king of Syracuse, or his allies. These articles being agreed to, Hamilcar surrendered Eryx upon condition that all his soldiers should march out with him upon his paying for each of them 18 Roman denarii. Hostages were given on both sides, and deputies were sent to Rome to procure a ratification of the treaty by the senate. After the senators had thoroughly informed themselves of the state of affairs, two more articles were added, viz. 1. That 1000 talents should

86 Hamilcar Barcas sent into Sicily. 87 Peace with the Romans. be paid immediately, and the 2200 in the space of 10 years at equal payments. 2. That the Carthaginians should quit all the little islands about Italy and Sicily, and never more come near them with ships of war, or raise mercenaries in those places. Necessity obliged Hamilcar to consent to these terms; but he returned to Carthage with an hatred to the Romans, which he did not even suffer to die with him, but transmitted to his son the great Hannibal.

Carthage. The Carthaginians were no sooner got out of this bloody and expensive war, than they found themselves engaged in another which was like to have proved fatal to them. It is called by ancient historians the *Lilyban war*, or the *war with the mercenaries*. The principal occasion of it was, that when Hamilcar returned to Carthage, he found the republic so much impoverished, that, far from being able to give these troops the largesses and rewards promised them, it could not pay them their arrears. He had committed the care of transporting them to one *Gisco*, who, being an officer of great penetration, as though he had foreseen what would happen, did not ship them off all at once, but in small and separate parties, that those who came first might be paid off and sent home before the arrival of the rest. The Carthaginians at home, however, did not act with the same prudence. As the state was almost entirely exhausted by the last war, and the immense sum of money, in consequence of the peace, paid to the Romans, they judged it would be a laudable action to save something to the public. They did not therefore pay off the mercenaries in proportion as they arrived, thinking it more proper to wait till they all came together, with a view of obtaining some remission of their arrears. But being soon made sensible of their wrong conduct on this occasion, by the frequent disorders these barbarians committed in the city, they with some difficulty prevailed upon the officers to take up their quarters at Sicca, and canton their troops in that neighbourhood. To induce them to this, however, they gave them a sum of money for their present subsistence, and promised to comply with their pretensions when the remainder of their troops arrived from Sicily. Here, being wholly immersed in idleness, to which they had long been strangers, a neglect of discipline ensued, and of course a petulant and licentious spirit immediately took place. They were now determined not to acquiesce in receiving their bare pay, but to insist upon the rewards Hamilcar had promised them, and even to compel the state of Carthage to comply with their demands by force of arms. The senate being informed of the mutinous disposition of the soldiery, dispatched Hanno, one of the suffetes, to pacify them. Upon his arrival at Sicca, he expatiated largely upon the poverty of the state, and the heavy taxes with which the citizens of Carthage were loaded; and therefore, instead of answering their high expectations, he desired them to be satisfied with receiving part of their pay, and remit the remainder to serve the pressing exigencies of the republic. The mercenaries being highly provoked, that neither Hamilcar, nor any other of the principal officers who commanded them in Sicily, and were the best judges of their merit, made their appearance on this occasion, but only Hanno, a person utterly unknown, and above all others

88 Causes of the war with the mercenaries. 89 Imprudent conduct of Hanno. others

Carthage. others utterly disagreeable to them, immediately had recourse to arms. Assembling therefore in a body to the number of 20,000, they advanced to Tunis, and immediately encamped before that city.

The Carthaginians being greatly alarmed at the approach of so formidable a body to Tunis, made large concessions to the mercenaries, in order to bring them back to their duty: but, far from being softened, they grew more insolent upon these concessions, taking them for the effects of fear; and therefore were altogether averse to thoughts of accommodation. The Carthaginians, making a virtue of necessity, showed a disposition to satisfy them in all points, and agreed to refer themselves to the opinion of some general in Sicily, which they had all along desired; leaving the choice of such commander entirely to them. Gisco was accordingly pitched upon to mediate this affair, the mercenaries believing Hamilcar to have been a principal cause of the ill treatment they met with, since he never appeared among them, and, according to the general opinion, had voluntarily resigned his commission. Gisco soon arrived at Tunis with money to pay the troops; and after conferring with the officers of the several nations apart, he harangued them in such a manner, that a treaty was upon the point of being concluded, when Spendius and Mathos, two of the principal mutineers, occasioned a tumult in every part of the camp. Spendius was by nation a Campanian, who had been a slave at Rome, and had fled to the Carthaginians. The apprehensions he was under of being delivered to his old master, by whom he was sure to be hanged or crucified, prompted him to break off the accommodation. Mathos was an African, and free born; but as he had been active in raising the rebellion, and was well acquainted with the implacable disposition of the Carthaginians, he knew that a peace must infallibly prove his ruin. He therefore joined with Spendius, and insinuated to the Africans the danger of concluding a treaty at that juncture, but which could not leave them singly exposed to the rage of the Carthaginians. This so incensed the Africans, who were much more numerous than the troops of any other nation, that they immediately assembled in a tumultuous manner. The foreigners soon joined them, being inspired by Spendius with an equal degree of fury. Nothing was now to be heard but the most horrid oaths and imprecations against Gisco and the Carthaginians. Whoever offered to make any remonstrance, or lend an ear to temperate counsels, was stoned to death by the enraged multitude. Nay, many persons lost their lives barely for attempting to speak, before it could be known whether they were in the interest of Spendius or the Carthaginians.

In the midst of these commotions, Gisco behaved with great firmness and intrepidity. He left no methods untried to soften the officers and calm the minds of the soldiery; but the torrent of sedition was now so strong, that there was no possibility of keeping it within bounds. They therefore seized upon the military chest, dividing the money among themselves in part of their arrears, put the person of Gisco under an arrest, and treated him as well as his attendants with the utmost indignity. Mathos and Spendius, to destroy the remotest hopes of an accommo-

dation with Carthage, applauded the courage and resolution of their men, loaded the unhappy Gisco and his followers with irons, and formally declared war against the Carthaginians. All the cities of Africa to whom they had sent deputies to exhort them to recover their liberty, soon came over to them, except Utica and Hippo Diarhytus. By this means their army being greatly increased, they divided it into two parts, with one of which they moved towards Utica, whilst the other marched to Hippo, in order to besiege both places. The Carthaginians, in the mean time, found themselves ready to sink under the pressure of their misfortunes. After they had been harassed 24 years by a most cruel and destructive foreign war, they entertained some hopes of enjoying repose. The citizens of Carthage drew their particular subsistence from the rents or revenues of their lands, and the public expences from the tribute paid from Africa; all which they were not only deprived of at once, but, what was worse, had it directly turned against them. They were destitute of arms and forces either by sea or land; had made no preparations for the sustaining of a siege, or the equipping of a fleet. They suffered all the calamities incident to the most ruinous civil war; and, to complete their misery, had not the least prospect of receiving assistance from any foreign friend or ally. Notwithstanding their deplorable situation, however, they did not despond, but pursued all the measures necessary to put themselves into a posture of defence. Hanno was appointed commander in chief of all their forces; and the most strenuous efforts were made; not only to repel all the attempts of the mutineers, but even to reduce them by force of arms.

In the mean time Mathos and Spendius laid siege to Utica and Hippacra at once; but as they were carried on by detachments drawn from the army for that purpose, they remained with the main body of their forces at Tunis, and thereby cut off all communication betwixt Carthage and the continent of Africa. By this means the capital was kept in a kind of blockade. The Africans likewise harassed them by perpetual alarms, advancing to the very walls of Carthage by day as well as by night, and treating with the utmost cruelty every Carthaginian that fell into their hands.

Hanno was dispatched to the relief of Utica with a good body of forces, 100 elephants, and a large train of battering engines. Having taken a view of the enemy, he immediately attacked their intrenchments, and, after an obstinate dispute, forced them. The mercenaries lost a vast number of men; and consequently the advantages gained by Hanno were so great, that they might have proved decisive, had he made a proper use of them: But becoming secure after his victory, and his troops being every where on their duty, the mercenaries, having rallied their forces, fell upon him, cut off many of his men, forced the rest to fly into the town, retook and plundered the camp, and seized all the provisions, military stores, &c. brought to the relief of the besieged. Nor was this the only instance of Hanno's military incapacity. Notwithstanding he lay encamped in the most advantageous manner near a town called *Gorxa*, at which place he twice overthrew the enemy, and had it in his power

⁹³ Carthage. power to have totally ruined them, he yet neglected to improve those advantages, and even suffered the mercenaries to possess themselves of the isthmus which joined the peninsula on which Carthage stood, to the continent of Africa.

93
Hamilcar
Barcas ap-
pointed to
command
against
them.

These repeated mistakes induced the Carthaginians once more to place Hamilcar Barcas at the head of their forces. He marched against the enemy with 10,000 men, horse and foot; being all the troops the Carthaginians could then assemble for their defence; a full proof of the low state to which they were at that time reduced. As Mathos, after he had possessed himself of the isthmus, had posted proper detachments in two passes on two hills facing the continent, and guarded the bridge over the Bagrada, which through Hanno's neglect he had taken, Hamilcar saw little probability of engaging him upon equal terms, or indeed of coming at him. Observing, however, that on the blowing of certain winds the mouth of the river was choked up with sand, so as to become passable, though with no small difficulty, as long as these winds continued; he halted for some time at the river's mouth, without communicating his design to any person. As soon as the wind favoured his intended project, he passed the river privately by night, and immediately after his passage he drew up the troops in order of battle, and advancing into the plain where his elephants were capable of acting, moved towards Mathos, who was posted at the village near the bridge. This daring action greatly surprised and intimidated the Africans. However, Spendius receiving intelligence of the enemy's motions, drew a body of 10,000 men out of Mathos's camp, with which he attended Hamilcar on one side, and ordered 15,000 from Utica to observe him on the other, thinking by this means to surround the Carthaginians, and cut them all off at one stroke. By feigning a retreat, Hamilcar found means to engage them at a disadvantage; and gave them a total overthrow, with the loss of 6000 killed and 2000 taken prisoners. The rest fled, some to the town at the bridge, and others to the camp at Utica. He did not give them time to recover from their defeat, but pursued them to the town near the bridge before mentioned; which he entered without opposition, the mercenaries flying in great confusion to Tunis; and upon this many towns submitted of their own accord to the Carthaginians, whilst others were reduced by force.

94
He defeats
them.

Notwithstanding these disasters, Mathos pushed on the siege of Hippo with great vigour, and appointed Spendius and Autaritus, commanders of the Gauls, with a strong body, to observe the motions of Hamilcar. These two commanders, therefore, at the head of a choice detachment of 6000 men drawn out of the camp at Tunis, and 2000 Gallic horse, attended the Carthaginian general, approaching him as near as they could with safety, and keeping close to the skirts of the mountains. At last Spendius, having received a strong reinforcement of Africans and Numidians, and possessing himself of all the heights surrounding the plain in which Hamilcar lay encamped, resolved not to let slip so favourable an opportunity of attacking him. Had a battle now ensued, Hamilcar and his army must in all probability have been cut off;

VOL. IV. Part I.

but by the desertion of one Naravafus, a young Numidian nobleman, with 2000 men, he found himself enabled to offer his enemies battle. The fight was obstinate and bloody; but at last the mercenaries were entirely overthrown, with the loss of 10,000 men killed and 4000 taken prisoners. All the prisoners that were willing to enlist in the Carthaginian service, Hamilcar received among his troops, supplying them with the arms of the soldiers who had fallen in the engagement. To the rest he gave full liberty to go where they pleased; upon condition that they should never for the future bear arms against the Carthaginians; informing them at the same time, however, that as many violators of this agreement as fell into his hands must expect to find no mercy.

Carthage.
95
Mercena-
ries again
defeated.

Mathos and his associates, fearing that this affected lenity of Hamilcar might occasion a defection among the troops, thought that the best expedient would be to put them upon some action so execrable in its nature that no hopes of reconciliation might remain. By their advice, therefore, Gisco and all the Carthaginian prisoners were put to death; and when Hamilcar sent to demand the remains of his countrymen, he received for answer, that whoever presumed hereafter to come upon that errand, should meet with Gisco's fate: after which they came to a resolution to treat with the same barbarity all such Carthaginians as should fall into their hands. In return for this enormity, Hamilcar threw all the prisoners that fell into his hands to be devoured by wild beasts; being convinced that compassion served only to make his enemies more fierce and untractable.

96
They put
to death all
the Cartha-
ginian pri-
soners.

The war was now carried on generally to the advantage of the Carthaginians; nevertheless, the malecontents still found themselves in a capacity to take the field with an army of 50,000 men. They watched Hamilcar's motions; but kept on the hills, carefully avoiding to come down into the plains, on account of the Numidian horse and Carthaginian elephants. Hamilcar, being much superior in skill to any of their generals, at last shut them up in a post so situated that it was impossible to get out of it. Here he kept them strictly besieged: and the mercenaries, not daring to venture a battle, began to fortify their camp, and surround it with ditches and intrenchments. They were soon pressed by famine so sorely, that they were obliged to eat one another: but they were driven desperate by the consciousness of their guilt, and therefore did not desire any terms of accommodation. At last, being reduced to the utmost extremity of misery, they insisted that Spendius, Autaritus, and Zarxas, their leaders, should in person have a conference with Hamilcar, and make proposals to him. Peace was accordingly concluded upon the following terms, viz. That ten of the ringleaders of the malecontents should be left entirely to the mercy of the Carthaginians; and that the troops should all be disarmed, every man retiring only in a single coat. The treaty was no sooner concluded, than Hamilcar, by virtue of the first article, seized upon the negociators themselves, and the army being informed that their chiefs were under arrest, had immediately recourse to arms, as suspecting they were betrayed; but Hamilcar, drawing out his army in order of battle, surrounded them, and either cut them to

99
Hannibal
taken and
crucified by
Mathos.

After the destruction of this army, Hamilcar invested Tunis, whither Mathos had retired with all his remaining forces. Hamilcar had another general, named *Hannibal*, joined in the command with him. Hannibal's quarter was on the road leading to Carthage, and Hamilcar's on the opposite side. The army was no sooner encamped, than Hamilcar caused Spendius, and the rest of the prisoners, to be led out in the view of the besieged, and crucified near the walls. Mathos, however, observing that Hannibal did not keep so good a guard as he ought to have done, made a sally, attacked his quarters, killed many of his men, took several prisoners, among whom was Hannibal himself, and plundered his camp. Taking the body of Spendius from the cross, Mathos immediately substituted Hannibal in its room; and 30 Carthaginian prisoners of distinction were crucified around him. Upon this disaster, Hamilcar immediately decamped, and posted himself along the sea-coast, near the mouth of the river Bagrada.

100
Mathos en-
tirely de-
feated and

soner.

The senate, though greatly terrified by this unexpected blow, omitted no means necessary for their preservation. They sent 30 senators, with Hanno at their head, to consult with Hamilcar about the proper measures for putting an end to this unnatural war, conjuring, in the most pressing manner, Hanno to be reconciled to Hamilcar, and to sacrifice his private resentment to the public benefit. This, with some difficulty, was effected: and the two generals came to a full resolution to act in concert for the good of the public. The senate, at the same time, ordered all the youth capable of bearing arms to be pressed into the service: by which means a strong reinforcement being sent to Hamilcar, he soon found himself in a condition to act offensively. He now defeated the enemy in all rencounters, drew Mathos into frequent ambuscades, and gave him one notable overthrow near Leptis. This reduced the rebels to the necessity of hazarding a decisive battle, which proved fatal to them. The mercenaries fled almost at the first onset; most of their army fell in the field of battle, and in the pursuit. Mathos, with a few, escaped to a neighbouring town, where he was taken alive, carried to Carthage, and executed; and then, by the reduction of the revolted cities, an end was put to this war, which, from the excesses of cruelty committed in it, according to Polybius, went among the Greeks by the name of the *inexpiable war*.

101
Hamilcar's
scheme to
equal Car-
thage with
Rome.

During the Lybian war, the Romans, upon some absurd pretences, wrested the island of Sardinia from the Carthaginians; which the latter, not being able to resist, were obliged to submit to. Hamilcar finding his country not in a condition to enter into an immediate war with Rome, formed a scheme to put it on a level with that haughty republic. This was by making an entire conquest of Spain, by which means the Carthaginians might have troops capable of coping with the Romans. In order to facilitate the execution of this scheme, he inspired both his son-in-law Asdrubal, and his son Hannibal, with an implacable aversion to the Romans, as the great opposers of his country's grandeur. Having completed all the necessary prepa-

rations, Hamilcar, after having greatly enlarged the Carthaginian dominions in Africa, entered Spain, where he commanded nine years, during which time he subdued many warlike nations, and amassed an immense quantity of treasure, which he distributed partly amongst his troops, and partly amongst the great men at Carthage; by which means he supported his interests with these two powerful bodies. At last, he was killed in a battle, and was succeeded by his son-in-law Asdrubal. This general fully answered the expectations of his countrymen; greatly enlarged their dominions in Spain; and built the city of New Carthage, now Carthage. He made such progress in his conquests, that the Romans began to grow jealous. They did not, however, choose at present to come to an open rupture, on account of the apprehensions they were under of an invasion from the Gauls. They judged it most proper, therefore, to have recourse to milder methods; and prevailed upon Asdrubal to conclude a new treaty with them. The articles of it were, *Asdrubal's*
1. That the Carthaginians should not pass the Iberus. *treaty with the Ro-*
2. That the Saguntines, a colony of Zacynthians, and a city situated between the Iberus and that part of Spain subject to the Carthaginians, as well as the other Greek colonies there, should enjoy their ancient rights and privileges. *mans.*

Asdrubal, after having governed the Carthaginian dominions in Spain for eight years, was treacherously murdered by a Gaul whose master he had put to death. Three years before this happened, he had written to Carthage, to desire that young Hannibal, then twenty-two years of age, might be sent to him. This request was complied with, notwithstanding the opposition of Hanno: and from the first arrival of the young man in the camp, he became the darling of the whole army. The great resemblance he bore to Hamilcar, rendered him extremely agreeable to the troops. Every talent and qualification he seemed to possess that can contribute towards forming a great man. After the death of Asdrubal, he was saluted general by the army with the highest demonstrations of joy. He immediately put himself in motion: and, in the first campaign, conquered the Olcades, a nation seated near the Iberus. The next year he subdued the Vaccæi, another nation in that neighbourhood. Soon after, the Carpætani, one of the most powerful nations in Spain, declared against the Carthaginians. Their army consisted of 100,000 men, with which they proposed to attack Hannibal on his return from the Vaccæi; but by a stratagem they were utterly defeated, and the whole nation obliged to submit. *He is mur- dered.*

Nothing now remained to oppose the progress of the Carthaginian arms but the city of Saguntum. Hannibal, however, for some time, did not think proper to come to a rupture with the Romans by attacking that place. At last he found means to embroil some of the neighbouring cantons, especially the Turdetani, or, as Appian calls them, the *Torboleta*, with the Saguntines, and thus furnished himself with a pretence to attack their city. Upon the commencement of the siege, the Roman senate dispatched two ambassadors to Hannibal, with orders to proceed to Carthage in case the general refused to give them satisfaction. They were scarce landed, when Hannibal, who was carrying on the siege of Saguntum with great vigour, *105*
Succeeded by Hannibal, who makes vast conquests in Spain. *106*
He attacks Saguntum.

Carthage. vigour, sent them word that he had something else to do than to give audience to ambassadors. At last, however, he admitted them; and, in answer to their remonstrances, told them, that the Saguntines had drawn their misfortunes upon themselves, by committing hostilities against the allies of Carthage; and at the same time desired the deputies, if they had any complaints to make of him, to carry them to the senate of Carthage. On their arrival in that capital, they demanded that Hannibal might be delivered up to the Romans to be punished according to his deserts; and this not being complied with, war was immediately declared between the two nations.

¹⁰⁷ **And takes it.** The Saguntines are said to have defended themselves for eight months with incredible bravery. At last, however, the city was taken, and the inhabitants were treated with the utmost cruelty. After this conquest, Hannibal put his African troops into winter-quarters at New Carthage; but in order to gain their affection, he permitted the Spaniards to retire to their respective homes.

¹⁰⁸ **He sets out for Italy.** The next campaign, having taken the necessary measures for securing Africa and Spain, he passed the Iberus, subdued all the nations betwixt that river and the Pyrenees, appointed Hanno commander of all the new conquered district, and immediately began his march for Italy. Upon mustering his forces, after they had been weakened by sieges, desertion, mortality, and a detachment of 10,000 foot and 1000 horse left with Hanno to support him in his new post, he found them to amount to 50,000 foot and 9000 horse, all veteran troops, and the best in the world. As they had left their heavy baggage with Hanno, and were all light armed, Hannibal easily crossed the Pyrenees; passed by Ruscinus, a frontier town of the Gauls; and arrived on the banks of the Rhone without opposition. This river he passed, notwithstanding of some opposition from the Gauls; and was for some time in doubt whether he should advance to engage the Romans, who, under Scipio, were bending their march that way, or continue his march for Italy. But to the latter he was soon determined by the arrival of Magilus prince of the Boii, who brought rich presents with him, and offered to conduct the Carthaginian army over the Alps. Nothing could have happened more favourable to Hannibal's affairs than the arrival of this prince, since there was no room to doubt the sincerity of his intentions. For the Boii bore an implacable enmity to the Romans, and had even come to an open rupture with them upon the first news that Italy was threatened with an invasion from the Carthaginians.

¹⁰⁹ **He crosses the Alps.** It is not known with certainty where Hannibal began to ascend the Alps. As soon as he began his march, the petty kings of the country assembled their forces in great numbers; and taking possession of the eminences over which the Carthaginians must necessarily pass, they continued harassing them, and were no sooner driven from one eminence than they seized on another, disputing every foot of land with the enemy, and destroying great numbers of them by the advantage they had of the ground. Hannibal, however, having found means to possess himself of an advantageous post, defeated and dispersed the enemy; and soon after took their capital city, where he found the

prisoners, horses, &c. that had before fallen into the hands of the enemy, and likewise corn sufficient to serve the army for three days. At last, after a most fatiguing march of nine days, he arrived at the top of the mountains. Here he encamped, and halted two days, to give his wearied troops some repose, and to wait for the stragglers. As the snow was lately fallen in great plenty, and covered the ground, this sight terrified the Africans and Spaniards, who were much affected with the cold. In order therefore to encourage them, the Carthaginian general led them to the top of the highest rock on the side of Italy, and thence gave them a view of the large and fruitful plains of Insubria, acquainting them that the Gauls, whose country they saw, were ready to join them. He also pointed out to them the place whereabout Rome stood, telling them, that by climbing the Alps, they had scaled the walls of that rich metropolis; and having thus animated his troops, he decamped, and began to descend the mountains. The difficulties they met with in their descent were much greater than those that had occurred while they ascended. They had indeed no enemy to contend with, except some scattered parties that came to steal rather than to fight; but the deep snows, the mountains of ice, craggy rocks, and frightful precipices, proved more terrible than any enemy. After they had for some days marched through narrow, steep, and slippery ways, they came at last to a place which neither elephants, horses, nor men, could pass. The way which lay between two precipices was exceeding narrow; and the declivity, which was very steep, had become more dangerous by the falling away of the earth. Here the guides stopped; and the whole army being terrified, Hannibal proposed at first to march round about, and attempt some other way: but all places round him being covered with snow, he found himself reduced to the necessity of cutting a way into the rock itself, through which his men, horses, and elephants, might descend. This work was accomplished with incredible labour; and then Hannibal, having spent nine days in ascending, and six in descending, the Alps, gained at length Insubria; and, notwithstanding all the disasters he had met with by the way, entered the country with all the boldness of a conqueror.

Hannibal, on his entry into Insubria, reviewed his army, when he found that of the 50,000 foot with whom he set out from New Carthage five months and 15 days before, he had now but 20,000, and that his 9000 horse were reduced to 6000. His first care, after he entered Italy, was to refresh his troops; who after so long a march, and such inexpressible hardships, looked like as many skeletons raised from the dead, or savages born in a desert. He did not, however, suffer them to languish long in idleness; but, joining the Insubrians, who were at war with the Taurinians, laid siege to Taurinum, the only city in the country, and in three days time became master of it, putting all who resisted to the sword. This struck the neighbouring barbarians with such terror, that of their own accord they submitted to the conqueror, and supplied his army with all sorts of provisions.

Scipio, the Roman general, in the mean time, who had gone in quest of Hannibal on the banks of the Rhone, was surprised to find his antagonist had cross-

Carthage. fed the Alps and entered Italy. He therefore returned with the utmost expedition. An engagement ensued near the river Ticinus, in which the Romans were defeated. The immediate consequence was, that Scipio repassed that river, and Hannibal continued his march to the banks of the Po. Here he staid two days, before he could cross that river over a bridge of boats. He then sent Mago in pursuit of the enemy, who having rallied their scattered forces, and repassed the Po, were encamped at Placentia. Afterwards having concluded a treaty with several of the Gallic cantons, he joined his brother with the rest of the army, and again offered battle to the Romans: but this they thought proper to decline; and at last the consul, being intimidated by the desertion of a body of Gauls, abandoned his camp, passed the Trebia, and posted himself on an eminence near that river. Here he drew lines round his camp, and waited the arrival of his colleague with the forces from Sicily.

112 They are again defeated. Hannibal being apprised of the consul's departure, sent out the Numidian horse to harass him on his march; himself moving with the main body to support them in case of need. The Numidians arriving before the rear of the Roman army had quite passed the Trebia, put to the sword or made prisoners all the stragglers they found there. Soon after, Hannibal coming up, encamped in sight of the Roman army, on the opposite bank. Here having learned the character of the consul Sempronius lately arrived, he soon brought him to an engagement, and entirely defeated him. Ten thousand of the enemy retired to Placentia; but the rest were either killed or taken prisoners. The Carthaginians pursued the flying Romans as far as the Trebia, but did not think proper to repass that river on account of the excessive cold.

Hannibal, after this action upon the Trebia, ordered the Numidians, Celtiberians, and Lusitanians, to make incursions into the Roman territories, where they committed great devastations. During his state of inaction, he endeavoured to win the affections of the Gauls, and likewise of the allies of the Romans; declaring to the Gallic and Italian prisoners, that he had no intention of making war upon them, being determined to restore them to their liberty, and protect them against the Romans: and to confirm them in their good opinion of him, he dismissed them all without ransom.

113 They are utterly defeated near the lake Thrasymenus. Next year, having crossed the Apennines, and penetrated into Etruria, Hannibal received intelligence that the new consul Flaminius lay encamped with the Roman army under the walls of Arretium. Having learned the true character of this general, that he was of an haughty, fierce, and rash disposition, he doubted not of being soon able to bring him to a battle. To inflame the impetuous spirit of Flaminius, the Carthaginian general took the road to Rome, and, leaving the Roman army behind him, destroyed all the country through which he passed with fire and sword; and as that part of Italy abounded with all the elegancies as well as necessities of life, the Romans and their allies suffered an incredible loss on this occasion. The rash consul was inflamed with the utmost rage on seeing the ravages committed by the Carthaginians; and therefore immediately approached them with great temerity, as if certain of

Carthage. victory. Hannibal in the mean time kept on, still advancing towards Rome, having Cortona on the left hand, and the lake Thrasymenus on the right; and at last, having drawn Flaminius into an ambuscade, entirely defeated him. The general himself, with 15,000 of his men, fell on the field of battle. A great number were likewise taken prisoners, and a body of 6000 men, who had fled to a town in Etruria, surrendered to Maherbal the next day. Hannibal lost only 1500 men on this occasion, most of whom were Gauls; though great numbers, both of his soldiers and of the Romans, died of their wounds. Being soon after informed that the consul Servilius had detached a body of 4000, or, according to Appian, 8000 horse from Ariminum, to reinforce his colleague in Etruria, Hannibal sent out Maherbal, with all the cavalry, and some of the infantry, to attack him. The Roman detachment consisted of chosen men, and was commanded by Centenius a Patrician. Maherbal had the good fortune to meet with him, and after a short dispute entirely defeated him. Two thousand of the Romans were laid dead on the spot; the rest, retiring to a neighbouring eminence, were surrounded by Maherbal's forces, and obliged next day to surrender at discretion; and this disaster, happening within a few days after the defeat at the lake Thrasymenus, almost gave the finishing stroke to the Roman affairs.

The Carthaginian army was now so much troubled with a scorbutic disorder, owing to the unwholesome encampments they had been obliged to make, and the morasses they had passed through, that Hannibal found it absolutely necessary to repose them for some time in the territory of Adria, a most pleasant and fertile country. In his various engagements with the Romans, he had taken a great number of their arms, with which he now armed his men after the Roman manner. Being now likewise master of that part of the country bordering on the sea, he found means to send an express to Carthage with the news of the glorious progress of his arms. The citizens received this news with the most joyful acclamations, at the same time coming to a resolution to reinforce their armies both in Italy and Spain with a proper number of troops.

115 The Romans being now in the utmost consternation, named a dictator, as was their custom in times of great danger. The person they chose to this office was Fabius Maximus, surnamed *Verrucosus*; a man as cool and cautious as Sempronius and Flaminius were warm and impetuous. He set out with a design not to engage Hannibal, but only to watch his motions, and cut off his provisions, which he knew was the most proper way to destroy him in a country so far from his own. Accordingly he followed him through Umbria and Picenum, into the territory of Adria, and then through the territories of the Marrucini and Frentani into Apulia. When the enemy marched, he followed them; when they encamped, he did the same; but for the most part on eminences, and at some distance from their camp, watching all their motions, cutting off their stragglers, and keeping them in a continual alarm. This cautious method of proceeding greatly distressed the Carthaginians, but at the same time raised discontents in his own army. But neither these

114 A Roman detachment cut to pieces or taken.

115 Fabius Maximus named dictator.

^{Carthage.} these discontents, nor the ravages committed by Hannibal, could prevail upon Fabius to alter his measures. The former, therefore, entered Campania, one of the finest countries of Italy. The ravages he committed there, raised such complaints in the Roman army, that the dictator, for fear of irritating his soldiers, was obliged to pretend a desire of coming to an engagement. Accordingly he followed Hannibal with more expedition than usual; but at the same time avoided, under various pretences, an engagement with more care than the enemy sought it. Hannibal finding he could not by any means bring the dictator to a battle, resolved to quit Campania, which he found abounding more with fruit and wine than corn, and to return to Samnium through the pass called Eribanus. Fabius concluding from his march that this was his design, got there before him, and encamped on Mount Callicula, which commanded the pass, after having placed several bodies in all the avenues leading to it.

¹¹⁶
He is out-
witted by
Hannibal.

Hannibal was for some time at a loss what to do; but at last contrived the following stratagem, which Fabius could not foresee nor guard against. Being encamped at the foot of Mount Callicula, he ordered Asdrubal to pick out of the cattle taken in the country, 2000 of the strongest and nimblest oxen, to tie faggots to their horns, and to have them and the herdsmen ready without the camp. After supper, when all was quiet, the cattle were brought in good order to the hill, where Fabius had placed some Roman parties in ambush to stop up the pass. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans seeing the light of the fires, imagined that the Carthaginians were marching by torch-light. However, Fabius kept close in his camp, depending on the troops he had placed in ambush; but when the oxen, feeling the fire on their heads, began to run up and down the hills, the Romans in ambush thinking themselves surrounded on all sides, and climbing the ways where they saw least light, returned to their camp leaving the pass open to Hannibal. Fabius, though rallied by his soldiers for being thus over-reached by the Carthaginian, still continued to pursue the same plan, marched directly after Hannibal, and encamped on some eminences near him.

Soon after this, the dictator was recalled to Rome; and as Hannibal, notwithstanding the terrible ravages he had committed, had all along spared the lands of Fabius, the latter was suspected of holding a secret correspondence with the enemy. In his absence, Minucius, the general of the horse, gained some advantages, which greatly tended to increase the discontent with the dictator, insomuch that before his return Minucius was put upon an equal footing with himself. The general of the horse proposed that each should command his day; but the dictator chose rather to divide the army, hoping by that means to save at least a part of it. Hannibal soon found means to draw Minucius to an engagement, and, by his masterly skill in laying ambushes, the Roman general was surrounded on every side, and would have been cut off with all his troops, had not Fabius hastened to his assistance, and relieved

him. Then the two armies uniting, advanced in good order to renew the fight: but Hannibal, not caring to venture a second action, founded a retreat, and retired to his camp; and Minucius, being ashamed of his rashness, resigned the command of the army to Fabius.

The year following, the Romans augmented their army to 87,000 men, horse and foot; and Hannibal being reduced to the greatest straits for want of provisions, resolved to leave Samnium, and penetrate into the heart of Apulia. Accordingly he decamped in the night; and by leaving fires burning, and tents standing in his camp, made the Romans believe for some time that his retreat was only feigned. When the truth was discovered, Æmilius was against pursuing him: but Terentius, contrary to the opinion of all the officers in the army, except the proconsul Servilius, was obstinately bent on following the enemy; and overtook them at Cannæ, till this time an obscure village in Apulia*. A battle ensued in this place, as memorable as any mentioned in history; in which the Romans, though almost double in number to the Carthaginians, were put to flight with most terrible slaughter; at least 45,000 of them being left dead on the field of battle, and 10,000 taken prisoners in the action or pursuit. The night was spent in Hannibal's camp in feasting and rejoicings, and next day in stripping the dead bodies of the unhappy Romans; after which the victorious general invested their two camps, where he found 4000 men.

The immediate consequence of this victory, as Hannibal had foreseen, was a disposition of that part of Italy called the Old province, Magna Grecia, Tarentum, and part of the territory of Capua, to submit to him. The neighbouring provinces likewise discovered an inclination to shake off the Roman yoke, but wanted first to see whether Hannibal was able to protect them. His first march was into Samnium, being informed that the Hirpini and other neighbouring nations were disposed to enter into an alliance with the Carthaginians. He advanced to Compsa, which opened its gates to him. In this place he left his heavy baggage, as well as the immense plunder he had acquired. After which he ordered his brother Mago with a body of troops destined for that purpose to possess himself of all the fortresses in Campania, the most delicious province of Italy. The humanity Hannibal had all along shown the Italian prisoners, as well as the fame of the complex victory he had lately obtained, wrought so powerfully upon the Lucani, Brutii, and Apulians, that they expressed an eager desire of being taken under his protection. Nay, even the Campanians themselves, a nation more obliged to the Romans than any in Italy, except the Latins, discovered an inclination to abandon their natural friends. Of this the Carthaginian general receiving intelligence, he bent his march towards Capua, not doubting, but that, by means of the popular faction there, he should easily make himself master of it; which accordingly happened. Soon after this place had made its submission, many cities of the Brutii opened their gates to Hannibal, who ordered his brother Mago to take possession of them. Mago was then dispatched to Carthage, with the important news of the victory at Cannæ, and the consequences attending it. Upon his

Carthage. his arrival there, he acquainted the senate, that Hannibal had defeated six Roman generals, four of whom were consuls, one dictator, and the other general of horse to the dictator: that he had engaged six consular armies, killed two consuls, wounded one, and driven another out of the field with scarce 50 men to attend him: that he had routed the general of the horse, who was of equal power with the consuls; and that the dictator was esteemed the only general fit to command an army, merely because he had not the courage to engage him; and as a demonstrative proof of what he advanced, he produced, according to some authors, three bushels and an half of gold rings, taken from knights and senators who had been killed in the various engagements.

121
Mago's account of Hannibal's success.

122
Hannibal superior to every other general mentioned in history.

Hitherto we have seen Hannibal surprisingly victorious; and, indeed, if we consider what he had already done, we shall find his exploits superior to those of any other general, either ancient or modern. Other commanders have been celebrated for victories gained over barbarous and uncivilized nations. Alexander the Great invaded and over-ran the empire of Persia; but that kingdom was then sunk in sloth and effeminacy, so as to be an easy conquest: but had the great commander turned his arms against the western nations, who were of a more martial disposition, it is more than probable he had not conquered so easily. Hannibal, on the other hand, lived at a time when the Romans were not only the most powerful, but the most warlike nation in the whole world. That nation he attacked with an army of only 26,000 men, without resources either for recruits, money, or provisions, except what he could procure in the enemies country. With these he had for three years resisted the Roman armies, which had been hitherto invincible by all other nations. Their armies had been commanded by generals of different tempers, dispositions, and abilities: the losses they sustained are by the Roman writers imputed to the faults of the generals themselves; but experience had abundantly shown, that these commanders, with all their faults, were able to conquer the most warlike nations, when commanded by another than Hannibal. In the battles fought with the Romans he had destroyed 200,000 of their men, and taken 50,000 prisoners; yet from the time of the battle of Cannæ, the affairs of this great man totally declined. The reason of this is, by the Roman historians, said to be, that when he put his army into winter-quarters in Capua, he so enervated himself and his army by debaucheries in that place, that he became no longer capable of coping with the Roman forces. But this seems by no means to have been the case; for the Roman historians themselves own, that, after the battle of Cannæ, he gave their armies many and terrible defeats, and took a great number of towns in their fight.

123
Cause of the decline of his affairs.

The true reason of that reverse of fortune which Hannibal now experienced, was his not having sufficient resources for recruiting his army. On the first news, indeed, of his success at Carthage, a body of 4000 Numidian cavalry, 40 elephants, and 1000 talents of silver, were granted by the senate. A large detachment of Spanish forces was also appointed to follow them; and that these last might be ready in due time, Mago set out immediately for Spain to raise

20,000 foot and 4000 horse there. Had this ample supply been sent with proper expedition, it is by no means probable that the Romans would have had any occasion to reflect upon Hannibal's conduct at Capua. That general would undoubtedly have obliged the haughty republic to submit to the superior force of his arms the next campaign. But, notwithstanding the influence of the Barcinian faction at Carthage, Hanno and his adherents found means not only to retard the march of the supplies intended, but even to diminish their number. Mago, through the artifices of that infatuated party, could obtain an order for only 12,000 foot and 2500 horse, and even with this inconsiderable body of troops he was sent into Spain. Hannibal being thus deserted by his country, found himself obliged to act on the defensive; his army amounting to no more now than 26,000 foot and 9000 horse. But though obliged to act in this manner, he was only hindered from conquering; the utmost efforts of the whole Roman power not being able to drive this small army out of Italy for more than 14 years.

124
Measures taken by the Romans.

The Romans, though greatly reduced, were not yet exhausted. They were able still to send two consular armies into the field, fully recruited and in good order; and as neither the Gauls nor Italians were natural allies of the Carthaginians, they did not fail to abandon them on the first reverse of fortune. After the Romans had recovered from the consternation into which they were thrown by the defeat at Cannæ, they chose a dictator, and recalled Marcellus, the conqueror of Syracuse, from Sicily. All the young Romans, above 17 years of age, of what rank soever, were obliged to enlist themselves; as were also those who had already served their legal time. By this means four legions and 10,000 horse were soon raised in the city. The allies of Rome, the colonies, and the municipia, furnished the contingence as usual. To these were added 8000 of the youngest and strongest slaves in the city. The republic purchased them of their masters, but did not oblige them to serve without their own consent, which they gave, by answering *Volo*, "I am willing;" whence they were called *volones*, to distinguish them from the other troops. As the Romans, after the loss of so many battles, had no swords, darts, or bucklers, left in their magazines, the *volones* were supplied with the arms which had been formerly taken from the enemy, and hung up in the public temples and porticoes. The finances of Rome were no less exhausted; but this defect was supplied by the liberality of her citizens. The senators showing the example, were followed first by the knights, and afterwards by all the tribes; who stripping themselves of all the gold they had, brought it to the public treasury. The senators only reserved their rings, and the *bulle* about their childrens necks. As for the silver coin, it was now, for the first time, alloyed with copper, and increased in its value. Thus the finances were put into a good condition, and a competent army raised.

This was plainly the last effort the Romans could make; and could Hannibal have procured a sufficient supply of men and money to enable him to cope with this army, and to break it as he had done the others before, there could have been no more resistance made on their part. He began, however, to be in want of money;

¹¹⁵ Carthage. money; and to procure it, gave the Roman prisoners leave to redeem themselves. These unhappy men agreed to send ten of their body to Rome to negotiate their redemption; and Hannibal required no other security for their return but their oath. Carthalo was sent at the head of them to make proposals of peace; but upon the first news of his arrival, the dictator sent a lictor to him, commanding him immediately to depart the Roman territory; and it was resolved not to redeem the captives. Upon this Hannibal sent the most considerable of them to Carthage; and of the rest he made gladiators, obliging them to fight with one another, even relations with relations, for the entertainment of his troops.

¹¹⁶ Asdrubal defeated by the Romans in Spain.

All this time Cneius and Publius Scipio had carried on the war in Spain with great success against the Carthaginians. Asdrubal had been ordered to enter Italy with his army to assist Hannibal; but being defeated by the Romans, was prevented. The dictator and senate of Rome, encouraged by this news, carried on the preparations for the next campaign with the greatest vigour, whilst Hannibal remained inactive at Capua. This inaction, however, seems to have proceeded from his expectation of succours from Africa, which never came, and which delay occasioned his ruin. The Roman dictator now released from prison all criminals, and persons confined for debt, who were willing to enlist themselves. Of these he formed a body of 6000 foot, armed with the broad swords and bucklers formerly taken from the Gauls. Then the Roman army, to the number of about 25,000 men, marched out of the city, under the command of the dictator; while Marcellus kept the remains of Varro's army, amounting to about 15,000 men, at Casilinum, in readiness to march whenever there should be occasion.

¹²⁷ Marcellus gains an advantage over Hannibal.

Thus the Roman forces were still superior to those of Hannibal; and as they now saw the necessity of following the example of Fabius Maximus, no engagement of any consequence happened the first year after the battle of Cannæ. Hannibal made a fruitless attempt upon Nola, expecting it would be delivered up to him; but this was prevented by Marcellus, who had entered that city, and falling unexpectedly from three gates upon the Carthaginians, obliged them to retire in great confusion, with the loss of 5000 men. This was the first advantage that had been gained by the Romans where Hannibal had commanded in person, and raised the spirits of the former not a little. They were, however, greatly dejected, on hearing that the consul Posthumus Albinus, with his whole army, had been cut off by the Boii, as he was crossing a forest. Upon this it was resolved to draw all the Roman forces out of Gaul and other countries, and turn them against Hannibal; so that the Carthaginian stood daily more and more in need of those supplies, which yet never arrived from Carthage. He reduced, however, the cities of Nuceria, Casilinum, Petelia, Consentia, Croton, Locri, and several others in Great Greece, before the Romans gained any advantage over him, except that before Nola already mentioned. The Campanians, who had espoused the Carthaginian interest, raised an army of 14,000 of their own nation in favour of Hannibal, and put one Marius Alfius at the head of it; but he was surprised by the consul Sem-

¹¹⁸ Hannibal takes several cities.

pronius, who defeated and killed him, with 2000 of his men. It was now found, that Hannibal had concluded a treaty of alliance, offensive and defensive, with Philip king of Macedon; but to prevent any disturbance from that quarter, a Roman army was sent to Macedon. Soon after this Marcellus defeated Hannibal in a pitched battle, having armed his men with long pikes used generally at sea, and chiefly in boarding of ships; by which means the Carthaginians were pierced through, while they were totally unable to hurt their adversaries with the short javelins they carried. Marcellus pursued them close; and, before they got to their camp, killed 5000, and took 600 prisoners; losing himself about 1000 men, who were trod down by the Numidian horse, commanded by Hannibal in person. After this defeat the Carthaginian general found himself deserted by 1200 of his best horse, partly Spaniards, and partly Numidians, who had crossed the Alps with him. This touched him so sensibly, that he left Campania, and retired into Apulia.

Carthage.

¹²⁹ He is defeated by Marcellus.

¹³⁰ He is deserted by a party of horse.

The Romans still continued to increase their forces; and Hannibal, not having the same resources, found it impossible to act against so many armies at once. Fabius Maximus advanced into Campania, whither Hannibal was obliged to return in order to save Capua. He ordered Hanno, however, at the head of 17,000 foot and 1700 horse, to seize Beneventum; but he was utterly defeated, scarce 2000 of his men being left alive. Hannibal himself, in the mean time, advanced to Nola, where he was again defeated by Marcellus. He now began to lose ground; the Romans retook Casilinum, Accua in Apulia, Arpi, and Aternum; but the city of Tarentum was delivered up to him by its inhabitants. The Romans then entered Campania, and ravaged the whole country, threatening Capua with a siege. The inhabitants immediately acquainted Hannibal with their danger; but he was so intent upon reducing the citadel of Tarentum, that he could not be prevailed upon to come to their assistance. In the mean time Hanno was again utterly defeated by Fulvius, his camp taken, and he himself forced to fly into Brutium with a small body of horse. The consuls then advanced with a design to besiege Capua in form. But in their way, Sempronius Gracchus, a man of great bravery, and an excellent general, was betrayed by a Lucanian and killed, which proved a very great detriment to the republic. Capua, however, was soon after invested on all sides; and the besieged once more sent to Hannibal, who now came to their assistance with his horse, his light-armed infantry, and 33 elephants. He found means to inform the besieged of the time he designed to attack the Romans, ordering them to make a vigorous sally at the same time. The Roman generals, Appius and Fulvius, upon the first news of the enemy's approach, divided their troops, Appius taking upon him to make head against the garrison, and Fulvius to defend the intrenchments against Hannibal. The former found no difficulty in repulsing the garrison; and would have entered the city with them, had he not been wounded at the very gate, which prevented him from pursuing his design. Fulvius found it more difficult to withstand Hannibal, whose troops behaved themselves with extraordinary resolution. A body of Spaniards and

Numidians.

Carthage. Numidians had even the boldness to pass the ditch, and, in spite of all opposition, climbing the ramparts, penetrated into the Roman camp; but not being properly seconded by the rest, they were all to a man cut in pieces. The Carthaginian general was so disheartened at this, especially after the garrison was repulsed, that he founded a retreat, which was made in good order. His next attempt for the relief of Capua was to march to Rome, where he hoped his approach would strike so much terror, that the armies would be called from before Capua; and that the Capuans might not be disheartened by his sudden departure, he found means to acquaint them with his design. The news of his approach caused great consternation in the metropolis. Some of the senators were for calling all the armies in Italy into the neighbourhood of Rome, as thinking nothing less was able to resist the terrible Carthaginian. But Fabius told them that Hannibal's design was not to take Rome, but relieve Capua; upon which Fulvius was recalled to Rome with 15,000 foot, and 1000 horse; and this obliged Hannibal again to retire. He then returned before Capua so suddenly that he surprised Appius in his camp, drove him out of it with the loss of a great number of men, and obliged him to entrench himself on some eminences, where he expected to be soon joined by his colleague Fulvius. As Hannibal, however, now expected to have all the Roman forces upon him, he could do nothing more for the relief of Capua, which was, of consequence, obliged to submit to the Romans.

134 He marches to Rome.

135 He surprises and defeats Appius.

136 Capua submits to the Romans.

137 Centenius Penula defeated by Hannibal.

138 As also the prætor Fulvius.

139 And the pro-consul Fulvius Centumalus.

A little before the surrender of Capua, Hannibal came up with a Roman army commanded by one M. Centenius Penula, who had signalized himself on many occasions as a centurion. This rash man, being introduced to the senate, had the assurance to tell them, that if they would trust him with a body of only 5000 men, he would give a good account of Hannibal. They gave him 8000, and his army was soon increased to double that number. He engaged the Carthaginians on Hannibal's first offering him battle; but after an engagement of two hours, was defeated, himself and all his men being slain, except about 1000. Soon after, having found means to draw the prætor Cneius Fulvius into an ambuscade, Hannibal cut in pieces almost his whole army, consisting of 18,000 men. In the mean time Marcellus was making great progress in Samnium. The city of Salapia was betrayed to him; but he took other two by assault. In the last of these he found 3000 Carthaginians, whom he put to the sword; and carried off 240,000 bushels of wheat, and 110,000 of barley. This, however, was by no means a compensation for the defeat which Hannibal soon after gave the proconsul Fulvius Centumalus, whom he surprised and cut off, with 13,000 of his men.

140 Marcellus drawn into an ambuscade and killed.

After this defeat, the great Marcellus advanced with his army to oppose Hannibal. Various engagements happened without any thing decisive. In one of them the Romans are said to have been defeated, and in another Hannibal; but, notwithstanding these, it was neither in the power of Marcellus, nor any other Roman general, totally to defeat or disperse the army commanded by Hannibal in person. Nay, in the eleventh year of the war, Hannibal found means to decoy into an ambuscade, and cut off, the great Marcellus.

lus himself; the consequence of which was, that the Carthage. Romans were obliged to raise the siege of Locri, with the loss of all their military engines.

141 Carthaginian affairs totally ruined by the defeat of Asdrubal.

Hitherto the Carthaginians, though no longer the favourites of fortune, had lost but little ground; but now they met with a blow which totally ruined their affairs. This was the defeat of Asdrubal, Hannibal's brother, who had left Spain, and was marching to his assistance. He crossed the Pyrenees without any difficulty; and, as the silver mines had supplied him with a very considerable quantity of treasure, he not only prevailed upon the Gauls to grant him a passage through their territories, but likewise to furnish him with a considerable number of recruits. Meeting with many favourable circumstances to expedite his march, he arrived at Placentia sooner than the Romans, or even his brother Hannibal, expected. Had he continued to use the same expedition with which he set out, and hastened to join his brother, it would have been utterly impossible to have saved Rome; but, sitting down before Placentia, he gave the Romans an opportunity of assembling all their forces to attack him. At last he was obliged to raise the siege, and began his march for Umbria. He sent a letter to acquaint his brother of his intended motion: but the messenger was intercepted; and the two consuls, joining their armies, with united forces fell upon the Carthaginians. As the latter were inferior both in numbers and resolution, they were utterly defeated, and Asdrubal was killed. About the same time, Hannibal himself is said to have suffered several defeats, and was retired to Canusium: but, on the fatal news of his brother's defeat and death, he was filled with despair, and retired to the extremity of Brutium; where, assembling all his forces, he remained for a considerable time in a state of inaction, the Romans not daring to disturb him, so formidable did they esteem him alone, though every thing about him went to wreck, and the Carthaginian affairs seemed not far from the verge of destruction. Livy tells us, that it was difficult to determine whether his conduct was more wonderful in prosperity or in adversity. Notwithstanding which, Brutium being but a small province, and many of its inhabitants being either forced into the service, or forming themselves into parties of banditti, so that a great part of it remained uncultivated, he found it a difficult matter to subsist there, especially as no manner of supplies were sent him from Carthage. The people there were as solicitous about preserving their possessions in Spain, and as little concerned about the situation of affairs in Italy, as if Hannibal had met with an uninterrupted course of success, and no disaster befallen him since he first entered that country.

142 The great progress of Scipio Africanus.

All their solicitude, however, about the affairs of Spain, was to no purpose; their generals, one after another, were defeated by the Romans. They had indeed cut off the two Scipios; but found a much more formidable enemy in the young Scipio, afterwards surnamed *Africanus*. He overthrew them in conjunction with Masinissa king of Numidia; and the latter, thereafter, abandoned their interest. Soon after, Syphax, king of the Massæylii, was likewise persuaded to abandon their party. Scipio also gave the Spanish Reguli a great overthrow; and reduced the cities

¹⁴³ Carthage. cities of New Carthage, Gades, and many other important places. At last the Carthaginians began to open their eyes when it was too late. Mago was ordered to abandon Spain, and sail with all expedition to Italy. He landed on the coast of Liguria with an army of 12,000 foot and 2000 horse; where he surprised Genoa, and also seized upon the town and port of Savo. A reinforcement was sent him to this place, and new levies went on very briskly in Liguria; but the opportunity was passed, and could not be recalled. Scipio having carried all before him in Spain, passed over into Africa, where he met with no enemy capable of opposing his progress. The Carthaginians then, seeing themselves on the brink of destruction, were obliged to recall their armies from Italy, in order to save their city. Mago, who had entered Insurbria, was defeated by the Roman forces there; and having retreated into the maritime parts of Liguria, met a courier who brought him orders to return directly to Carthage. At the same time, Hannibal was likewise recalled. When the messengers acquainted him with the senate's pleasure, he expressed the utmost indignation and concern, groaning, gnashing his teeth, and scarce refraining from tears. Never banished man, according to Livy, showed so much regret in quitting his native country, as Hannibal did at going out of that of the enemy.

¹⁴⁴ Scipio lands in Africa. The Carthaginian general was no sooner landed in Africa, than he sent out parties to get provisions for the army, and buy horses to remount the cavalry. He entered into a league with the Regulus of the Areacidæ, one of the Numidian tribes. Four thousand of Syphax's horse came over in a body to him; but as he did not think proper to repose any confidence in them, he put them all to the sword, and distributed their horses among his troops. Vermina, one of Syphax's sons, and Masetulus, another Numidian prince, likewise joined him with a considerable body of horse. Most of the fortresses in Masinissa's kingdom either surrendered to him upon the first summons, or were taken by force. Narce, a city of considerable note there, he made himself master of by stratagem. Tychæus, a Numidian Regulus, and faithful ally of Syphax, whose territories were famous for an excellent breed of horses, reinforcing him also with 2000 of his best cavalry, Hannibal advanced to Zama, a town about five days journey distant from Carthage, where he encamped. He thence sent out spies to observe the posture of the Romans. These being brought to Scipio, he was so far from inflicting any punishment upon them, which he might have done by the laws of war, that he commanded them to be led about the camp, in order to take an exact survey of it, and then dismissed them. Hannibal, admiring the noble assurance of his rival, sent a messenger to desire an interview with him; which, by means of Masinissa, he obtained. The two generals, therefore, escorted by equal detachments of horse, met at Nadagara, where, by the assistance of two interpreters, they held a private conference. Hannibal flattered Scipio in the most refined and artful manner, and expatiated upon all those topics which he thought could influence that general to grant his nation a peace upon tolerable terms; amongst other things, that the Carthaginians would willingly confine themselves to Africa, since such was

the will of the gods, in order to procure a lasting peace, whilst the Romans would be at liberty to extend their conquest to the remotest nations. Scipio answered, that the Romans were not prompted by ambition, or any sinister views, to undertake either the former or present war against the Carthaginians; but by justice, and a proper regard for their allies. He also observed, that the Carthaginians had, before his arrival in Africa, not only made him the same proposals, but likewise agreed to pay the Romans 5000 talents of silver, restore all the Roman prisoners without ransom, and deliver up all their galleys. He insisted on the perfidious conduct of the Carthaginians, who had broke a truce concluded with them; and told him, that, so far from granting them more favourable terms, they ought to expect more rigorous ones; which if Hannibal would submit to, a peace would ensue; if not, the decision of the dispute must be left to the sword.

¹⁴⁵ Mago and Hannibal recalled. This conference, betwixt two of the greatest generals the world ever produced, ending without success, they both retired to their respective camps; where they informed their troops, that not only the fate of Rome and Carthage, but that of the whole world, was to be determined by them the next day. An engagement ensued*, in which, as Polybius informs us, the surprising military genius of Hannibal displayed itself in an extraordinary manner. Scipio likewise, according to Livy, passed an high encomium upon him, on account of his uncommon capacity in taking advantages, the excellent arrangement of his forces, and the manner in which he gave his orders during the engagement. The Roman general indeed, not only approved his conduct, but openly declared that it was superior to his own. Nevertheless, being vastly inferior to the enemy in horse, and the state of Carthage obliging him to hazard a battle with the Romans at no small disadvantage, Hannibal was utterly routed, and his camp taken. He fled first to Thon, and afterwards to Adrumetum, from whence he was recalled to Carthage; where being arrived, he advised his countrymen to conclude a peace with Scipio on whatever terms he thought proper to prescribe.

¹⁴⁶ Hannibal's proceedings after his arrival in Africa. Thus was the second war of the Carthaginians with the Romans concluded. The conditions of peace were very humiliating to the Carthaginians. They were obliged to deliver up all the Romans deserters, fugitive slaves, prisoners of war, and all the Italians whom Hannibal had obliged to follow him. They also delivered up all their ships of war, except ten triremes, all their tame elephants, and were to train up no more of these animals for the service. They were not to engage in any war without the consent of the Romans. They engaged to pay to the Romans, in 50 years, 10,000 Euboic talents, at equal payments. They were to restore to Masinissa all they had usurped from him or his ancestors, and to enter into an alliance with him. They were also to assist the Romans both by sea and land, whenever they were called upon so to do, and never to make any levies either in Gaul or Liguria. These terms appeared so intolerable to the populace, that they threatened to plunder and burn the houses of the nobility; but Hannibal having assembled a body of 6000 foot and 500 horse at Marthama, prevented an

Carthage. insurrection, and by his influence completed the accommodation.

¹⁵¹
Carthaginians oppressed by Masinissa.

The peace between Carthage and Rome was scarce signed, when Masinissa unjustly made himself master of part of the Carthaginian dominions in Africa, under pretence that these formerly belonged to his family. The Carthaginians, through the villanous mediation of the Romans, found themselves under a necessity of ceding these countries to that ambitious prince, and of entering into an alliance with him. The good understanding between the two powers continued for many years afterwards; but at last Masinissa violated the treaties subsisting betwixt him and the Carthaginian republic, and not a little contributed to its subversion.

¹⁵²
Hannibal flies to Antiochus.

After the conclusion of the peace, Hannibal still kept up his credit among his countrymen. He was intrusted with the command of an army against some neighbouring nations in Africa; but this being disagreeable to the Romans, he was removed from it, and raised to the dignity of prætor in Carthage. Here he continued for some time, reforming abuses, and putting the affairs of the republic into a better condition; but this likewise being disagreeable to the Romans, he was obliged to fly to Antiochus king of Syria. After his flight, the Romans began to look upon the Carthaginians with a suspicious eye; though, to prevent every thing of this kind, the latter had ordered two ships to pursue Hannibal, had confiscated his effects, rased his house, and by a public decree declared him an exile. Soon after, disputes arising between the Carthaginians and Masinissa, the latter, notwithstanding the manifest iniquity of his proceedings, was supported by the Romans. That prince, grasping at further conquests, endeavoured to embroil the Carthaginians with the Romans, by asserting that the former had received ambassadors from Perseus king of Macedon; that the senate assembled in the temple of Æsculapius in the night-time in order to confer with them; and that ambassadors had been dispatched from Carthage to Perseus, in order to conclude an alliance with him. Not long after this, Masinissa made an irruption into the province of Tyfca, where he soon possessed himself of 70, or, as Apian will have it, 50 towns and castles. This obliged the Carthaginians to apply with great importunity to the Roman senate for redress, their hands being so tied up by an article in the last treaty, that they could not repel force by force, in case of an invasion, without their consent. Their ambassadors begged, that the Roman senate would settle once for all what dominions they were to have, that they might from thenceforth know what they had to depend upon; or if their state had any way offended the Romans, they begged that they would punish them themselves, rather than leave them exposed to the insults and vexations of so merciless a tyrant. Then prostrating themselves on the earth, they burst out into tears. But, notwithstanding the impression their speech made, the matter was left undecided; so that Masinissa had liberty to pursue his rapines as much as he pleased. But whatever villanous designs the Romans might have with regard to the republic of Carthage, they affected to show a great regard to the principles of justice and honour. They therefore sent Cato, a man

¹⁵³
Iniquitous proceedings of Masinissa and the Romans.

famous for committing enormities under the specious pretence of public spirit, into Africa, to accommodate all differences betwixt Masinissa and the Carthaginians. The latter very well knew their fate, had they submitted to such a mediation; and therefore appealed to the treaty concluded with Scipio, as the only rule by which their conduct and that of their adversary ought to be examined. This *unreasonable* appeal so incensed the righteous Cato, that he pronounced them a devoted people, and from that time resolved upon their destruction. For some time he was opposed by Scipio Nasica; but the people of Carthage, knowing the Romans to be their inveterate enemies, and reflecting upon the iniquitous treatment they had met with from them ever since the commencement of their disputes with Masinissa, were under great apprehensions of a visit from them. To prevent a rupture as much as possible, by a decree of the senate, they impeached Asdrubal general of the army, and Carthalo commander of the auxiliary forces, together with their accomplices, as guilty of high treason, for being the authors of the war against the king of Numidia. They sent a deputation to Rome, to discover what sentiments were entertained there of their late conduct, and to know what satisfaction the Romans required. These messengers meeting with a cold reception, others were dispatched, who returned with the same success. This made the unhappy citizens of Carthage believe that their destruction was resolved upon; which threw them into the utmost despair. And indeed they had but too just grounds for such a melancholy apprehension, the Roman senate now discovering an inclination to fall in with Cato's measures. About the same time, the city of Utica, being the second in Africa, and famous for its immense riches, as well as its equally commodious and capacious port, submitted to the Romans. Upon the possession of so important a fortress, which, by reason of its vicinity to Carthage, might serve as a place of arms in the attack of that city, the Romans declared war against the Carthaginians without the least hesitation. In consequence of this declaration, the consuls M. Manlius Nepos, and L. Marcius Censorinus, were dispatched with an army and fleet to begin hostilities with the utmost expedition. The land forces consisted of 80,000 foot and 4000 chosen horse; and the fleet of 50 quinqueremes, besides a vast number of transports. The consuls had secret orders from the senate not to conclude the operations but by the destruction of Carthage, without which, it was pretended, the republic could not but look upon all her possessions as insecure. Pursuant to the plan they had formed, the troops were first landed at Lilybæum in Sicily, from whence, after receiving a proper refreshment, it was proposed to transport them to Utica.

¹⁵⁴
War declared by the Romans against Carthage.

The answer brought by the last ambassadors to Carthage had not a little alarmed the inhabitants of that city. But they were not yet acquainted with the resolutions taken at Rome. They therefore sent fresh ambassadors thither, whom they invested with full powers to act as they thought proper for the good of the republic, and even to submit themselves without reserve to the pleasure of the Romans. But the most sensible persons among them did not expect any great success from this condescension, since the early

¹⁵⁵
Ambassadors sent to Rome.

Carthage. submission of the Uticans had rendered it infinitely less meritorious than it would have been before. However, the Romans seemed to be in some measure satisfied with it, since they promised them their liberty, the enjoyment of their laws, and in short every thing that was dear and valuable to them. This threw them into a transport of joy, and they wanted words to extol the moderation of the Romans. But the senate immediately dashed all their hopes, by acquainting them, that this favour was granted upon condition that they would send 300 young Carthaginian noblemen of the first distinction to the prætor Fabius at Lilybæum, within the space of 30 days, and comply with all the orders of the consuls. These hard terms filled the whole city with inexpressible grief: but the hostages were delivered; and as they arrived at Lilybæum before the 30 days were expired, the ambassadors were not without hopes of softening their hard-hearted enemy. But the consuls only told them, that upon their arrival at Utica they should learn the farther orders of the republic.

156
The Romans demand 300 hostages,

157
And all the Carthaginian arms, military machines, &c.

158
They command them to destroy their city.

159
The Carthaginians resolve to sustain a siege.

The ministers no sooner received intelligence of the Roman fleet appearing off Utica, than they repaired thither, in order to know the fate of their city. The consuls, however, did not judge it expedient to communicate all the commands of their republic at once, lest they should appear so harsh and severe, that the Carthaginians would have refused to comply with them. They first, therefore, demanded a sufficient supply of corn for the subsistence of their troops. Secondly, That they should deliver up into their hands all the triremes they were then masters of. Thirdly, That they should put them in possession of all their military machines. And fourthly, That they should immediately convey all their arms into the Roman camp.

As care was taken that there should be a convenient interval of time betwixt every one of these demands, the Carthaginians found themselves ensnared, and could not reject any one of them, though they submitted to the last with the utmost reluctance and concern. Censorinus now imagining them incapable of sustaining a siege, commanded them to abandon their city, or, as Zonaras will have it, to demolish it; permitting them to build another 80 stadia from the sea, but without walls or fortifications. This terrible decree threw the senate and every one else into despair; and the whole city became a scene of horror, madness, and confusion. The citizens cursed their ancestors for not dying gloriously in the defence of their country, rather than concluding such ignominious treaties of peace, that had been the cause of the deplorable condition to which their posterity was then reduced. At length, when the first commotion was a little abated, the senators assembled, and resolved to sustain a siege. They were stripped of their arms and destitute of provisions; but despair raised their courage, and made them find out expedients. They took care to shut the gates of the city; and gathered together on the ramparts great heaps of stones, to serve them instead of arms in case of a surprise. They took the malefactors out of prison, gave the slaves their liberty, and incorporated them in the militia. Asdrubal was recalled, who had been sentenced to die only to please the Romans; and he was invited to employ 20,000 men he had raised against his country, in defence of it. An-

other Asdrubal was appointed to command in Carthage; and all seemed resolute, either to save their city or perish in its ruins. They wanted arms; but, by order of the senate, the temples, porticoes, and all public buildings, were turned into workhouses, where men and women were continually employed in making arms. As they encouraged one another in their work, and lost no time in procuring to themselves the necessities of life, which were brought to them at stated hours, they every day made 144 bucklers, 300 swords, 1000 darts, and 500 lances and javelins. As to ballistæ and catapultæ, they wanted proper materials for them; but their industry supplied that defect. Where iron and brass were wanting, they made use of silver and gold, melting down the statues, vases, and even the utensils of private families; for, on this occasion, even the most covetous became liberal. As tow and flax were wanting to make cords for working the machines, the women, even those of the first rank, freely cut off their hair and dedicated it to that use. Without the walls, Asdrubal employed the troops in getting together provisions, and conveying them safe into Carthage; so that there was as great plenty there as in the Roman camp.

In the mean time the consuls delayed drawing near to Carthage, not doubting but the inhabitants, whom they imagined destitute of necessities to sustain a siege, would, upon cool reflection, submit; but at length, finding themselves deceived in their expectation, they came before the place and invested it. As they were still persuaded that the Carthaginians had no arms, they flattered themselves that they should easily carry the city by assault. Accordingly they approached the walls in order to plant their scaling-ladders; but to their great surprise they discovered a prodigious multitude of men on the ramparts, shining in the armour they had newly made. The legionaries were so terrified at this unexpected sight, that they drew back, and would have retired, if the consuls had not led them on to the attack: which, however, proved unsuccessful; the Romans, in spite of their utmost efforts, being obliged to give over the enterprize, and lay aside all thoughts of taking Carthage by assault. In the mean time Asdrubal, having collected from all places subject to Carthage a prodigious number of troops, came and encamped within reach of the Romans, and soon reduced them to great straits for want of provisions. As Marcius, one of the Roman consuls, was posted near a marsh, the exhalations of the stagnating waters, and the heat of the season, infected the air, and caused a general sickness among his men. Marcius, therefore, ordered his fleet to draw as near the shore as possible, in order to transport his troops to a healthier place. Asdrubal being informed of this motion, ordered all the old barks in the harbour to be filled with faggots, tow, sulphur, bitumen, and other combustible materials; and then taking advantage of the wind, which blew towards the enemy, let them drive upon their ships, which were for the most part consumed. After this disaster, Marcius was called home to preside at the elections; and the Carthaginians looking upon the absence of one of the consuls to be a good omen, made a brisk sally in the night; and would have surprised the consul's camp, had not Æmilianus, with some squadrons, marched out of the

Carthage. gate opposite to the place where the attack was made, and, coming round, fell unexpectedly on their rear, and obliged them to return in disorder to the city.

Asdrubal had posted himself under the walls of a city named Nepheris, 24 miles distant from Carthage, and situated on an high mountain, which seemed inaccessible on all sides. From thence he made incursions into the neighbouring country, intercepted the Roman convoys, fell upon their detachments sent out to forage, and even ordered parties to insult the consular army in their camp. Hereupon the consul resolved to drive the Carthaginian from this advantageous post, and set out for Nepheris. As he drew near the hills, Asdrubal suddenly appeared at the head of his army in order of battle, and fell upon the Romans with incredible fury. The consular army sustained the attack with great resolution; and Asdrubal retired in good order to his post, hoping the Romans would attack him there. But the consul being now convinced of his danger, resolved to retire. This Asdrubal no sooner perceived, than he rushed down the hill, and falling upon the enemy's rear, cut a great number of them in pieces. The whole Roman army was now saved by the bravery of Scipio Æmilianus. At the head of 300 horse, he sustained the attack of all the forces commanded by Asdrubal, and covered the legions, while they passed a river in their retreat before the enemy. Then he and his companions threw themselves into the stream, and swam across it. When the army had crossed the river, it was perceived that four manipuli were wanting; and soon after they were informed that they had retired to an eminence, where they resolved to sell their lives as dear as possible. Upon this news Æmilianus, taking with him a chosen body of horse, and provisions for two days, crossed the river, and flew to the assistance of his countrymen. He seized an hill over against that on which the four manipuli were posted; and, after some hours repose, marched against the Carthaginians who kept them invested, fell upon them at the head of his squadron with the boldness of a man determined to conquer or die, and in spite of all opposition opened a way for his fellow-soldiers to escape. On his return to the army, his companions, who had given him over for lost, carried him to his quarters in a kind of triumph; and the manipuli he had saved gave him a crown of *græmen*. By these and some other exploits, Æmilianus gained such reputation, that Cato, who is said never to have commended any body before, could not refuse him the praises he deserved; and is said to have foretold that Carthage would never be reduced till Scipio Æmilianus was employed in that expedition.

The next year, the war in Africa fell by lot to the consul L. Calpurnius Piso; and he continued to employ Æmilianus in several important enterprises, in which he was attended with uncommon success. He took several castles; and in one of his excursions, found means to have a private conference with Phameas, general, under Asdrubal, of the Carthaginian cavalry, and brought him over, together with 2200 of his horse, to the Roman interest. Under the consul Calpurnius Piso himself, however, the Roman arms were unsuccessful. He invested Clupea; but was obliged to abandon the enterprise, with the loss of a great number of men killed by the enemy in their sallies.

From this place he went to vent his rage on a city newly built, and thence called *Neapolis*, which professed a strict neutrality, and had even a safeguard from the Romans. The consul, however, plundered the place, and stripped the inhabitants of all their effects. After this he laid siege to *Hippagreta*, which employed the Roman fleet and army the whole summer; and, on the approach of winter, the consul retired to Utica, without performing a single action worth notice during the whole campaign.

The next year Scipio Æmilianus was chosen consul, and ordered to pass into Africa; and upon his arrival, the face of affairs was greatly changed. At the time of his entering the port of Utica, 3500 Romans were in great danger of being cut in pieces before Carthage. These had seized Megalia, one of the suburbs of the city; but as they had not furnished themselves with provisions to subsist there, and could not retire, being closely invested on all sides by the enemy's troops, the prætor Mancinus, who commanded this detachment, seeing the danger into which he had brought himself, dispatched a light boat to Utica, to acquaint the Romans there with his situation. Æmilianus received this letter a few hours after his landing; and immediately flew to the relief of the besieged Romans, obliged the Carthaginians to retire within their walls, and safely conveyed his countrymen to Utica. Having then drawn together all the troops, Æmilianus applied himself wholly to the siege of the capital.

His first attack was upon Megalia; which he carried by assault, the Carthaginian garrison retiring into the citadel of Byrsa. Asdrubal, who had commanded the Carthaginian forces in the field, and was now governor of the city, was so enraged at the loss of Megalia, that he caused all the Roman captives taken in the two years the war lasted, to be brought upon the ramparts, and thrown headlong, in the sight of the Roman army, from the top of the wall; after having, with an excess of cruelty, commanded their hands and feet to be cut off, and their eyes and tongues to be torn out. He was of a temper remarkably inhuman, and it is said that he even took pleasure in seeing some of these unhappy men flayed alive. Æmilianus, in the mean time, was busy in drawing lines of circumvallation and contravallation cross the neck of land which joined the isthmus on which Carthage stood to the continent. By this means, all the avenues on the land-side of Carthage being shut up, the city could receive no provisions that way. His next care was to raise a mole in the sea, in order to block up the old port, the new one being already shut up by the Roman fleet; and this great work he effected with immense labour. The mole reached from the western neck of land, of which the Romans were masters, to the entrance of the port; and was 90 feet broad at the bottom and 80 at the top. The besieged, when the Romans first began this surprising work, laughed at the attempt; but were no less alarmed than surprised, when they beheld a vast mole appearing above water, and by that means the port rendered inaccessible to ships, and quite useless. Prompted by despair, however, the Carthaginians, with incredible and almost miraculous industry, dug a new basin, and cut a passage into the sea, by which they could receive the provisions that were sent them by their troops in the field. With the same diligence

Carthage. ligence and expedition, they fitted out a fleet of 50 triremes; which, to the great surprise of the Romans, appeared suddenly advancing into the sea through this new canal, and even ventured to give the enemy battle. The action lasted the whole day, with little advantage on either side. The day after, the consul endeavoured to make himself master of a terrace which covered the city on the side next the sea; and on this occasion the besieged signalized themselves in a most remarkable manner. Great numbers of them, naked and unarmed, went into the water in the dead of the night, with unlighted torches in their hands; and having, partly by swimming, partly by wading, got within reach of the Roman engines, they struck fire, lighted their torches, and threw them with fury against the machines. The sudden appearance of these naked men, who looked like so many monsters started up out of the sea, so terrified the Romans who guarded the machines, that they began to retire in the utmost confusion. The consul, who commanded the detachment in person, and had continued all night at the foot of the terrace, endeavoured to stop his men, and even ordered those who fled to be killed. But the Carthaginians, perceiving the confusion the Romans were in, threw themselves upon them like so many wild beasts; and having put them to flight only with their torches, they set fire to the machines, and entirely consumed them. This, however, did not discourage the consul: he renewed the attack a few days after, carried the terrace by assault, and lodged 4000 men upon it. As this was an important post, because it pent in Carthage on the sea-side, Æmilianus took care to fortify and secure it against the sallies of the enemy; and then, winter approaching, he suspended all further attacks upon the place till the return of good weather. During the winter season, however, the consul was not inactive. The Carthaginians had a very numerous army under the command of one Diogenes, strongly encamped near Nepheris, whence convoys of provisions were sent by sea to the besieged, and brought into the new basin. To take Nepheris, therefore, was to deprive Carthage of her chief magazine. This Æmilianus undertook, and succeeded in the attempt. He first forced the enemy's entrenchments, put 70,000 of them to the sword, and made 10,000 prisoners; all the inhabitants of the country, who could not retire to Carthage, having taken refuge in this camp. After this, he laid siege to Nepheris, which was reduced in 22 days. Asdrubal being disheartened by the defeat of the army, and touched with the misery of the besieged now reduced to the utmost extremity for want of provisions, offered to submit to what conditions the Romans pleased, provided the city was spared; but this was absolutely refused.

171
Cotho ta-
ken.

Early in the spring, Æmilianus renewed the siege of Carthage; and in order to open himself a way into the city, he ordered Lælius to attempt the reduction of Cotho, a small island which divided the two ports. Æmilianus himself made a false attack on the citadel, in order to draw the enemy thither. This stratagem had the desired effect; for the citadel being a place of the greatest importance, most of the Carthaginians hastened thither, and made their utmost efforts to repulse their aggressors. But in the mean time Lælius having, with incredible expedition, built a wooden

bridge over the channel which divided Cotho from the isthmus, entered the island, scaled the walls of the fortrefs which the Carthaginians had built there, and made himself master of that important post. The proconsul, who was engaged before Byrsa, no sooner understood, by the loud shouts of the troops of Lælius, that he had made himself master of Cotho, than he abandoned the false attack, and unexpectedly fell on the neighbouring gate of the city, which he broke down, notwithstanding the showers of darts that were incessantly discharged upon his men from the ramparts. As night coming on prevented him from proceeding farther, he made a lodgment within the gate, and waited there for the return of day, with a design to advance through the city to the citadel, and attack it on that side which was but indifferently fortified. Pursuant to this design, at day-break he ordered 4000 fresh troops to be sent from his camp, and, having solemnly devoted to the infernal gods the unhappy Carthaginians, he began to advance at the head of his men, through the streets of the city, in order to attack the citadel. Having advanced to the market-place, he found that the way to the citadel lay through three exceeding steep streets. The houses on both sides were very high, and filled with Carthaginians, who overwhelmed the Romans as they advanced with darts and stones; so that they could not proceed till they had cleared them. To this end Æmilianus in person, at the head of a detachment, attacked the first house, and made himself master of it sword in hand. His example was followed by the officers and soldiers, who went on from house to house, putting all they met with to the sword. As fast as the houses were cleared on both sides, the Romans advanced in order of battle towards the citadel; but met with a vigorous resistance from the Carthaginians, who on this occasion behaved with uncommon resolution. From the market-place to the citadel, two bodies of men fought their way every step, one above on the roofs of the houses, the other below in the streets. The slaughter was inexpressibly great and dreadful. The air rung with shrieks and lamentations. Some were cut in pieces, others threw themselves down from the tops of the houses; so that the streets were filled with dead and mangled bodies. But the destruction was yet greater, when the proconsul commanded fire to be set to that quarter of the town which lay next to the citadel. Incredible multitudes, who had escaped the swords of the enemy, perished in the flames, or by the fall of the houses. After the fire, which lasted six days, had demolished a sufficient number of houses, Æmilianus ordered the rubbish to be removed, and a large area to be made, where all his troops might have room to act. Then he appeared with his whole army before Byrsa; which so terrified the Carthaginians, who had fled thither for refuge, that first of all 25,000 women, and then 30,000 men, came out of the gates in such a condition as moved pity. They threw themselves prostrate before the Roman general, asking no favour but life. This was readily granted, not only to them, but to all that were in Byrsa, except the Roman deserters, whose number amounted to 900. Asdrubal's wife earnestly intreated her husband to suffer her to join the suppliants, and carry with her to the proconsul her two sons, who were as yet very young; but

but the barbarian denied her request, and rejected her remonstrances with menaces. The Roman deserters seeing themselves excluded from mercy, resolved to die sword in hand, rather than deliver themselves up to the vengeance of their countrymen. Then Asdrubal, finding them all resolved to defend themselves to the last breath, committed to their care his wife and children; after which he, in a most cowardly and mean-spirited manner, came and privately threw himself at the conqueror's feet. The Carthaginians in the citadel no sooner understood that their commander had abandoned the place, than they threw open the gates, and put the Romans in possession of Byrsa. They had now no enemy to contend with but the 900 deserters; who, being reduced to despair, retreated into the temple of Æsculapius, which was as a second temple within the first. There the proconsul attacked them; and these unhappy wretches, finding there was no way to escape, set fire to the temple. As the flames spread, they retreated from one part of the building to another, till they got to the roof. There Asdrubal's wife appeared in her best apparel, and having uttered the most bitter imprecations against her husband, whom she saw standing below with Æmilianus, "Base coward (said she), the mean things thou hast done to save thy life shall not avail thee: thou shalt die this instant, at least in thy two children." Having thus spoken, she stabbed both the infants with a dagger; and while they were yet struggling for life, threw them both from the top of the temple, and then leaped down after them into the flames.

176
Carthage,
plundered,

Æmilianus delivered up the city to be plundered, but in the manner prescribed by the Roman military law. The soldiers were allowed to appropriate to themselves all the furniture, utensils, and brass money, they should find in private houses: but all the gold and silver, the statues, pictures, &c. were reserved to be put into the hands of the quæstors. On this occasion the cities of Sicily, which had been often plundered by the Carthaginian armies, recovered a number of statues, pictures, and other valuable monuments: among the rest, the famous brazen bull, which Phalaris had ordered to be cast, and used as the chief instrument of his cruelty, was restored to the inhabitants of Agrigentum. As Æmilianus was greatly inclined to spare what remained of this stately metropolis, he wrote to the senate on the subject, from whom he received the following orders: 1. The city of Carthage, with Byrsa, and Megalia, shall be entirely destroyed, and no traces of them left. 2. All the cities that have lent Carthage any assistance shall be dismantled. 3. The territories of those cities which have declared for the Romans, shall be enlarged with lands taken from the enemy. 4. All the lands between Hippo and Carthage shall be divided among the inhabitants of Utica. 5. All the Africans of the Carthaginian state, both men and women, shall pay an annual tribute to the Romans at so much per head. 6. The whole country, which was subject to the Carthaginian state, shall be turned into a Roman province, and be governed by a prætor, in the same manner as Sicily. Lastly, Rome shall send commissioners into Africa, there to settle jointly with the proconsul the state of the new province. Before Æmilianus destroyed the city, he performed those religious ceremonies which were re-

quired on such occasions: he first sacrificed to the gods, and then caused a plough to be drawn round the walls of the city. After this, the towers, ramparts, walls, and all the works which the Carthaginians had raised in the course of many ages, and at a vast expence, were levelled with the ground; and lastly, fire was set to the edifices of the proud metropolis, which consumed them all, not a single house escaping the flames. Though the fire began in all quarters at the same time, and burnt with incredible fury, it continued for 17 days before all the buildings were consumed.

Thus fell Carthage, about 146 years before the birth of Christ; a city whose destruction ought to be attributed more to the intrigues of an abandoned faction, composed of the most profligate part of its citizens, than to the power of its rival. The treasure Æmilianus carried off, even after the city had been delivered up to be plundered by the soldiers, was immense, Pliny making it to amount to 4,470,000 pounds weight of silver. The Romans ordered Carthage never to be inhabited again, denouncing dreadful imprecations against those who, contrary to this prohibition, should attempt to rebuild any part of it, especially Byrsa and Megalia. Notwithstanding this, however, about 24 years after, C. Gracchus, tribune of the people, in order to ingratiate himself with them, undertook to rebuild it; and, to that end, conducted thither a colony of 6000 Roman citizens. The workmen, according to Plutarch, were terrified by many unlucky omens at the time they were tracing the limits and laying the foundations of the new city; which the senate being informed of, would have suspended the attempt. But the tribune, little affected with such presages, continued to carry on the work, and finished it in a few days. From hence it is probable that only a slight kind of huts were erected; but, whether Gracchus executed his design, or the work was entirely discontinued, it is certain, that Carthage was the first Roman colony ever sent out of Italy. According to some authors, Carthage was rebuilt by Julius Cæsar; and Strabo, who flourished in the reign of Tiberius, affirms it in his time to have been equal if not superior to any other city in Africa. It was looked upon as the capital of Africa for several centuries after the commencement of the Christian æra. Maxentius laid it in ashes about the sixth or seventh year of Constantine's reign. Genseric, king of the Vandals, took it A. D. 439; but about a century afterwards it was re-annexed to the Roman empire by the renowned Belisarius. At last the Saracens, under Mohammed's successors, towards the close of the seventh century, so completely destroyed it, that there are now scarce any traces remaining.

At the commencement of the third Punic war, Carthage appears to have been one of the first cities in the world. — It was seated on a peninsula 360 stadia or 45 miles in circumference, joined to the continent by an isthmus 23 stadia or three miles and a furlong in breadth. On the west side there projected from it a long tract of land half a stadium broad; which shooting out into the sea, separated it from a lake or morass, and was strongly fortified on all sides by rocks and a single wall. In the middle of the city stood the citadel of Byrsa, having on the top of it a temple sacred

to

Carthage. to Æsculapius, seated upon rocks on a very high hill, to which the ascent was by 60 steps. On the south side the city was surrounded by a triple wall, 30 cubits high; flanked all round by parapets and towers, placed at equal distances of 480 feet. Every tower had its foundation sunk 32 feet deep, and was four stories high, though the walls were but two: they were arched; and, in the lower part, corresponding in depth with the foundations above mentioned, were stalls large enough to hold 300 elephants with their fodder, &c. Over these were stalls and other conveniences for 4000 horses; and there was likewise room for lodging 20,000 foot and 4000 cavalry, without in the least incommoding the inhabitants. There were two harbours, so disposed as to have a communication with one another. They had one common entrance 70 feet broad, and shut up with chains. The first was appropriated to the merchants; and included in it a vast number of places of refreshment, and all kinds of accommodations for seamen. The second, as well as the island of Cothon, in the midst of it, was lined with large keys, in which were distinct receptacles for securing and sheltering from the weather 220 ships of war. Over these were magazines of all sorts of naval stores. The entrance into each of these receptacles was adorned with two marble pillars of the Ionic order; so that both the harbour and island represented on each side two magnificent galleries. Near this island was a temple of Apollo, in which was a statue of the god all of massy gold; and the inside of the temple all lined with plates of the same metal, weighing 1000 talents. The city was 23 miles in circumference, and at the time we speak of contained 700,000 inhabitants. Of their power we may have some idea, by the quantity of arms they delivered up to the Roman consuls. The whole army was astonished at the long train of carts loaded with them, which were thought sufficient to have armed all Africa. At least it is certain, that on this occasion were put into the hands of the Romans, 2000 catapultæ, 200,000 complete suits of armour, with an innumerable quantity of swords, darts, javelins, arrows, and beams armed with iron which were thrown from the ramparts by the balistæ.

The character transmitted of the Carthaginians is extremely bad; but we have it only on the authority of the Romans, who being their implacable enemies cannot be much relied upon. As to their religion, manners, &c. being much the same with the Phœnicians of which they were a colony, the reader is referred for an account of these things to the article PHOENICIA.

On the ruins of Carthage there now stands only a small village called *Melcha*. The few remains of Carthage consist only of some fragments of walls and 17 cisterns for the reception of rain-water.

There are three eminences, which are so many masses of fine marbles pounded together, and were in all probability the sites of temples and other distinguished buildings. The present ruins are by no means the remains of the ancient city destroyed by the Romans; who after taking it entirely erased it, and ploughed up the very foundations: so truly they adhered to the well-known advice perpetually inculcated by Cato the Elder, *Delenda est Carthago*. It was again rebuilt by the Gracchi family, who conducted a colony to repopulate it; and continually increasing in splendour, it

became at length the capital of Africa under the Roman emperors. It subsisted near 700 years after its first demolition, until it was entirely destroyed by the Saracens in the beginning of the 7th century.

It is a singular circumstance that the two cities of Carthage and Rome should have been built just opposite one to the other; the bay of Tunis and the mouth of the Tiber being in a direct line.

VIRG. *Æn.* i. 4.

New-CARTHAGE, a considerable town of Mexico, in the province of Costarica. It is a very rich trading place. W. Long. 86. 7. N. Lat. 9. 5.

CARTHAGENA, a province of South America, and one of the most considerable in New Castile, on account of the great trade carried on by the capital; for the country itself is neither fertile, rich, nor populous. The capital city, called likewise *Carthagena*, is situated in W. Long. 77. N. Lat. 11. on a sandy island, by most writers called a peninsula; which, forming a narrow passage on the south-west, opens a communication with that called *Tierra Bomba*, as far as *Bocca Chica*. The little island which now joins them was formerly the entrance of the bay; but it having been filled up by orders of the court, *Bocca Chica* became the only entrance: this, however, has been filled up since the attempt of Vernon and Wentworth, and the old passage again opened. On the north side the land is so narrow, that, before the wall was begun, the distance from sea to sea was only 35 toises; but afterwards enlarging, it forms another island on this side; so that, excepting these two places, the whole city is entirely surrounded by salt-water. To the eastward it has a communication, by means of a wooden bridge, with a large suburb called *Xemani*, built on another island, which is also joined to the continent by a bridge of the same materials. The fortifications both of the city and suburbs are built after the modern manner, and lined with free-stone; and, in time of peace, the garrison consists of ten companies of 77 men each, besides militia. The city and suburbs are well laid out, the streets straight, broad, uniform, and well paved. All the houses are built of stone or brick, only one story high, well contrived, neat, and furnished with balconies and lattices of wood, which is more durable in that climate than iron, the latter being soon corroded by the acrimonious quality of the atmosphere. The climate is exceedingly unhealthy. The Europeans are particularly subject to the terrible disease called the *black vomit*, which sweeps off multitudes annually on the arrival of the galleons. It seldom continues above three or four days; in which time the patient is either dead or out of danger, and if he recovers is never subject to a return of the same distemper. —This disease has hitherto foiled all the art of the Spanish physicians; as has also the leprosy, which is very common here. At Carthagena, likewise, that painful tumour in the legs, occasioned by the entrance of the *Dracunculus* or Guinea-worm, is very common and troublesome. Another disorder peculiar to this country, and to Peru, is occasioned by a little insect called *Nigua*, so extremely minute, as scarce to be visible to the naked eye. This insect breeds in the dust, insinuates itself into the soles of the feet and the legs, piercing the skin with such subtilty, that there is no being

Carthagina being aware of it, before it has made its way to the flesh. If it is perceived in the beginning, it is extracted with little pain; but having once lodged its head, and pierced the skin, the patient must undergo the pain of an incision, without which a nodus would be formed, and a multitude of insects ingendered, which would soon overspread the foot and leg. One species of the *nigua* is venomous; and when it enters the toe, an inflammatory swelling, greatly resembling a venereal bubo, takes place in the groin.

CARTHAGENA, a sea-port town of Spain in the kingdom of Murcia, and capital of a territory of the same name; built by Asdrubal, a Carthaginian general, and named after Carthage. It has the best harbour in all Spain, but nothing else very considerable; the bishop's see being transferred to Toledo. In 1706 it was taken by Sir John Leak; but the Duke of Berwick retook it afterwards. W. Long. o. 58. N. Lat. 37. 36.

CARTHAMUS, in botany: A genus of the order of polygamia æqualis, belonging to the syngenesia class of plants, and in the natural method ranking under the 49th order, *Compositæ*. The calyx is ovate, imbricated with scales, close below, and augmented with subovate foliaceous appendices at top.—Of this genus there are nine species; but the only remarkable one is the tinctorius, with a saffron-coloured flower. This is a native of Egypt and some of the warm parts of Asia. It is at present cultivated in many parts of Europe, and also in the Levant, from whence great quantities of it are annually imported into Britain for the purposes of dyeing and painting. It is an annual plant, and rises with a stiff ligneous stalk, about two feet and a half or three feet in height, dividing upwards into many branches, garnished with oval pointed leaves fitting close to the branches. The flowers grow single at the extremity of each branch; the heads of the flowers are large, inclosed in a scaly empalement; each scale is broad at the base, flat, and formed like a leaf of the plant, terminating in a sharp spine. The lower part of the empalement spreads open; but the scales above closely embrace the florets, which are of a fine saffron colour, and are the part used for the purposes above mentioned. The good quality of this commodity is in the colour, which is of a bright saffron hue: and in this the British carthamus very often fails; for if there happens much rain during the time the plants are in flower, the flowers change to a dark or dirty yellow, as they likewise do if the flowers are gathered with any moisture remaining upon them.—The plants are propagated by seeds, which should be sown in drills, at two feet and a half distance from one another, in which the seeds should be scattered singly. The plants will appear in less than a month; and in three weeks or a month after, it will be proper to hoe the ground; at which time the plants should be left six inches distant: after this they will require a second hoeing; when they must be thinned to the distance at which they are to remain. If after this they are hoed a third time, they will require no farther care till they come to flower; when, if the safflower is intended for use, the florets should be cut off from the flowers as they come to perfection: but this must be performed when they are perfectly dry; and then they should be dried in a kiln with a moderate fire, in the same manner as the true saffron. But

in those flowers which are propagated for seeds, the florets must be cut off, or the seeds will prove abortive.—The seeds of carthamus have been celebrated as a cathartic; but they operate very slowly, and for the most part disorder the stomach and bowels, especially when given in substance: triturated with distilled aromatic waters, they form an emulsion less offensive, yet inferior in efficacy to the more common purgatives. They are eaten by a species of Egyptian parrot, which is very fond of them; to other birds or beasts they would prove a mortal poison.

CARTHUSIANS, a religious order founded in the year 1080, by one Brudo. The Carthusians, so called from the desert of *Chartreux*, the place of their institution, are remarkable for the austerity of their rule. They are not to go out of their cells, except to church, without leave of their superior; nor speak to any person without leave. They must not keep any portion of their meat or drink till next day; their beds are of straw, covered with a felt; their cloathing two hair-cloths, two cowls, two pair of hose, and a cloke, all coarse. In the refectory, they are to keep their eyes on the dish, their hands on the table, their attention on the reader, and their hearts fixed on God. Women are not allowed to come into their churches. It is computed that there are 172 houses of Carthusians; whereof five are of *Nuns*, who practise the same austerities as the Monks. They are divided into 16 provinces, each of which has two visitors. There have been several canonized saints of this order, four cardinals, 70 archbishops and bishops, and a great many very learned writers.

CARTHUSIAN-Powder, the same with kermes-mineral. See **KERMES**.

CARTILAGE, in anatomy, a body approaching to the nature of bones; but lubricous, flexible, and elastic. See **ANATOMY**.

CARTILAGINOUS, in ichthyology, a title given to all fish whose muscles are supported by cartilages instead of bones; and comprehends the same genera of fish to which Linnæus has given the name of *amphibia nantes*: but the word *amphibia* ought properly to be confined to such animals as inhabit both elements; and can live, without any inconvenience, for a considerable time, either on land or in water; such as tortoises, frogs, and several species of lizards; and, among the quadrupeds, hippopotami, &c. &c. Brit. Zool. 175.

Many of the cartilaginous fish are viviparous, being excluded from an egg, which is hatched within them. The egg consists of a white and a yolk; and is lodged in a case formed of a thick tough substance, not unlike softened horn: such are the eggs of the *ray* and *shark* kinds. Some again differ in this respect, and are oviparous; such is the *surgeon*, and others.

They breathe either through certain apertures beneath, as in the *rays*; on their sides, as in the *sharks*, &c.; or on the top of the head, as in the *pipe-fish*: for they have not covers to their gills like the bony fish.

CARTMEL, a town of Lancashire in England. It is seated among the hills called Carmel-fells, not far from the sea, and near the river Kent; adorned with a very handsome church, built in the form of a cross like a cathedral. The market is well supplied with corn, sheep, and fish. W. Long. 2. 43. N. Lat. 54. 15.

CARTON, or **CARTOON**, in painting, a design drawn

Carton.
Cartouche.

drawn on strong paper, to be afterwards calked through, and transferred on the fresh plaster of a wall to be painted in fresco. It is also used for a design coloured, for working in mosaic, tapestry, &c. The word is from the Italian *Cartoni*, (*carta* "paper," and *oni* "large,") denoting many sheets of paper pasted on canvas, on which large designs are made, whether coloured or with chalks only. Of these many are to be seen at Rome, particularly by Domenichino. Those by Andrea Mantegna, which are at Hampton Court, were made for paintings in the old ducal palace at Mantua. But the most famous performances of this sort are,

The *Cartoons of Raphael*, so deservedly applauded throughout Europe by all authors of refined taste, and all true admirers of the art of design, for their various and matchless merit, particularly with regard to the invention, and to the great and noble expression of such a variety of characters, countenances, and most expressive attitudes, as they are differently affected and properly engaged, in every composition. These cartoons are seven in number, and form only a small part of the sacred historical designs executed by this great artist, while engaged in the chambers of the Vatican under the auspices of Popes Julius II. and Leo X. When finished, they were sent to Flanders, to be copied in tapestry, for adorning the pontifical apartments: which tapestries were not sent to Rome till several years after the decease of Raphael, and even in all probability were not finished and sent there before the terrible sack of that city in the time of Clement VII. when Raphael's scholars were fled from thence, and none left to enquire after the original Cartoons, which lay neglected in the store-rooms of the manufactory. The great revolution also which followed in the Low Countries prevented their being noticed amidst the entire neglect of the works of art. It was therefore a most fortunate circumstance that these seven escaped the wreck of the others, which were torn in pieces, and remain dispersed as fragments in different collections. These seven were purchased by Rubens for Charles I. and they have been so roughly handled from the first, that holes were pricked for the weavers to pounce the outlines, and other parts almost cut through in tracing also. In this state perhaps they as fortunately escaped the sale amongst the royal collection, by the disproportioned appraisement of these seven at 300 l. and the nine pieces, being the Triumph of Julius Cæsar, by Andrea Mantegna, appraised at 1000 l. They seem to have been taken small notice of till King William built a gallery, purposely to receive them, at Hampton Court; whence they were moved, on their suffering from damp, to the Queen's Palace. They are now at Windsor Castle, and open to public inspection.

CARTOUCHE, in architecture and sculpture, an ornament representing a scroll of paper. It is usually a flat member, with wavings, to represent some inscription, device, cipher, or ornament of armoury. They are, in architecture, much the same as modillions; only these are set under the cornice in wainscoting, and those under the cornice at the eaves of a house.

CARTOUCHE, in the military art, a case of wood, about three inches thick at the bottom, girt with marlin, holding about four hundred musket-balls, besides

fix or eight balls of iron, of a pound weight, to be fired out of a hobit, for the defence of a pass, &c.

A cartouche is sometimes made of a globular form, and filled with a ball of a pound weight; and sometimes it is made for the guns, being of a ball of half or quarter a pound weight, according to the nature of the gun, tied in form of a bunch of grapes, on a tom-pion of wood, and coated over. These were made in the room of partridge-shot.

CARTRIDGE, in the military art, a case of paste-board or parchment, holding the exact charge of a fire-arm. Those for muskets, carabines, and pistols, hold both the powder and ball for the charge; and those of cannon and mortars are usually in cases of pasteboard or tin, sometimes of wood, half a foot long, adapted to the caliber of the piece.

CARTRIDGE-BOX, a case of wood or turned iron, covered with leather, holding a dozen musket-cartridges. It is wore upon a belt, and hangs a little lower than the right pocket-hole.

CARTWRIGHT (William) an eminent divine and poet, born at Northway, near Tewksbury, in Gloucestershire, in September 1611. He finished his education at Oxford; afterwards went into holy orders, and became a most florid preacher in the university. In 1642, he had the place of succentor in the church of Salisbury; and, in 1643, was chosen junior proctor in the university. He was also metaphysical reader there. Wit, judgment, elocution, a graceful person and behaviour, occasioned that encomium of him from dean Fell, "That he was the utmost that man could come to." He was an expert linguist; an excellent orator; and at the same time was esteemed an admirable poet. There are extant of his, four plays, and some poems. He died in 1643, aged 33.

CARVAGE, *carvagium*, the same with **CARRUCAGE**.

Henry III. is said to have taken carvage, that is two marks of silver of every knight's fee, towards the marriage of his sister Isabella to the emperor. Carvage could only be imposed on the tenants *in capite*.

CARVAGE also denotes a privilege whereby a man is exempted from the service of carrucage.

CARUCATURIUS, in ancient law books, he that held land in foccage, or by plough tenure.

CARUCATE. See **CARRUCATE**.

CARVER, a cutter of figures or other devices in wood. See **CARVING**.

Carvers answer to what the Romans called *sculptores*, who were different from *cælatores*, or engravers, as these last wrought in metal.

CARVER is also an officer of the table, whose business is to cut up the meat, and distribute it to the guests. The word is formed from the Latin *carptor*, which signifies the same. The Romans also called him *carpus*, sometimes *scissor*, *scindendi magister*, and *struitor*.

In the great families at Rome, the carver was an officer of some figure. There were masters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks also had their carvers, called *διατροι*, q. d. *deribitores*, or *distributors*. In the primitive times, the master of the feast carved for all his guests. Thus in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, the hero

Cartridge
||
Carver.

Carui
||
Carum.

himself carved the meat. Of later times, the same office on solemn occasions was executed by some of the chief men of Sparta. Some derive the custom of distributing to every guest his portion, from those early ages when the Greeks first left off feeding on acorns, and learned the use of corn: The new diet was so great a delicacy, that to prevent the guests from quarrelling about it, it was found necessary to make a fair distribution.

In Scotland, the king has a hereditary carver in the family of Anstruther.

CARUI, or CARVI, in botany. See CARUM.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body, by means of some sharp instrument, especially a chisel. In this sense carving includes statuary and engraving, as well as cutting in wood.

CARVING, in a more particular sense, is the art of engraving or cutting figures in wood. In this sense *carving*, according to Pliny, is prior both to statuary and painting.

To carve a figure or design, it must be first drawn or pasted on the wood; which done, the rest of the block, not covered by the lines of the design, are to be cut away with little narrow-pointed knives. The wood fittest for the use is that which is hard, tough, and close, as beech, but especially box: to prepare it for drawing the design on, they wash it over with white-lead tempered in water; which better enables it either to bear ink or the crayon, or even to take the impression by chalking. When the design is to be pasted on the wood, this whitening is omitted, and they content themselves with seeing the wood well planed. Then wiping over the printed side of the figure with gum tragacanth dissolved in water, they clap it smooth on the wood, and let it dry; which done, they wet it slightly over, and fret off the surface of the paper gently, till all the strokes of the figure appear distinctly. This done, they fall to cutting or carving, as above.

CARUM, in botany: A genus of the digynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 45th order, *Umbellatae*. The fruit is ovate, oblong, and striated; the involucre monophyllous; the petals are carinated or keel-shaped below, and emarginated by their inflexion.

Species, &c. 1. The carui, or caraway of the shops, grows naturally in many places of Britain. It is a biennial plant, which rises from seeds one year, flowers the next, and perishes soon after the seeds are ripe. It hath a taper root like a parsnip, but much smaller, which runs deep into the ground, sending out many small fibres, and hath a strong aromatic taste. From the root arises one or two smooth, solid, channelled stalks, about two feet high, garnished with winged leaves, having long naked foot-stalks. 2. The hispanicum is also a biennial, and is a native of Spain. It rises with a stronger stalk than the former, which seldom grows more than a foot and half high; but is closely garnished with fine narrow leaves like those of dill. Both these plants are propagated by seeds, which ought to be sown in autumn. Sheep, goats, and swine, eat this plant; cows and horses are not fond of it. Parkinson says, the young roots of cara-

way are better eating than parsnips. The tender leaves may be boiled with pot herbs. The seeds have an aromatic smell, and a warm pungent taste. They are used in cakes, incruited with sugar, as sweet-meats, and distilled with spirituous liquors, for the sake of the flavour they afford. They are in the number of the four greater hot seeds; and frequently employed, as a stomachic and carminative, in flatulent colics and the like.

CARUNCULA, or CARUNCLE, in anatomy, a term denoting a little piece of flesh, and applied to several parts of the human body. Thus,

CARUNCULÆ *Myrtiformes*, in anatomy, fleshy knobs about the size of a myrtle-berry, supposed to owe their origin to the breaking of the hymen. See ANATOMY, n° 108.

CARUNCLES in the urethra, proceeding from a gonorrhœa, or an ulceration of the urethra, may be reduced by introducing the BOUGIE.

CARUS, a sudden deprivation of sense and motion, affecting the whole body. See (the *Index* subjoined to) MEDICINE.

CARUS (Marcus Aurelius), was raised from a low station, by his great merit, to be emperor of Rome in 282. He showed himself worthy of the empire; subdued its enemies; and gave the Romans a prospect of happy days, when he was unfortunately killed by lightning in 284.

CARWAR, a town of Asia, on the coast of Malabar in the East Indies, and where the East India company have a factory, fortified with two bastions. The valleys about it abound in corn and pepper, which last is the best in the East Indies. The woods on the mountains abound with quadrupeds, such as tigers, wolves, monkeys, wild hogs, deer, elks, and a sort of beeves of a prodigious size. The religion of the natives is Paganism; and they have a great many strange and superstitious customs. E. Long. 73. 7. N. Lat. 15. 0.

CARYA-AE, (Stephanus); *Carya, arum*, (Pausanias); a town of Laconia, between Sparta and the borders of Messenia: where stood a temple of Diana, thence called *Caryatis, idis*; whose annual festival, called *Carya, orum*, was celebrated by Spartan virgins with dances. An inhabitant, *Caryates*, and *Caryatis*; *Caryatis apis*, a Laconian bee, (Stephanus.)

CARYÆ-ARUM, (anc. geog.), a place in Arcadia, towards the borders of Laconia. Whether from this of Arcadia, or that of Laconia, the *Columnæ Caryatides* of Vitruvius and Pliny (which were statues of matrons in stoles or long robes) took the appellation, is disputed.

CARY (Lucius), Lord viscount Falkland, was born in Oxfordshire, about the year 1610; a young nobleman of great abilities and accomplishments. About the time of his father's death in 1633, he was made gentleman of the privy chamber to king Charles I. and afterwards secretary of state. Before the assembling of the long parliament, he had devoted himself to literature, and every pleasure which a fine genius, a generous disposition, and an opulent fortune, could afford: when called into public life, he stood foremost in all attacks on the high prerogatives of the crown; but when civil convulsions came to an extremity, and it was necessary to choose a side, he tempered his zeal, and

Cartuncula
||
Cary.

Cary,
Caryates.

and defended the limited powers that remained to monarchy. Still anxious however for his country, he seems to have dreaded equally the prosperity of the royal party, or that of the parliament; and among his intimate friends, often sadly reiterated the word *peace*. This excellent nobleman freely exposed his person for the king in all hazardous enterprizes, and was killed in the 34th year of his age at the battle of Newberry. In Welwood's memoirs we are told, that whilst he was with the king at Oxford, his majesty went one day to see the public library, where he was shown among other books a Virgil, nobly printed, and exquisitely bound. The lord Falkland, to divert the king, would have his majesty make a trial of his fortune by the Sortes Virgilianæ, an usual kind of divination in ages past, made by opening a Virgil. The king opening the book, the passage which happened to come up, was that part of Dido's imprecation against Æneas, iv. 615, &c. which is thus translated by Dryden.

" Oppress'd with numbers in th' unequal field,
" His men discourag'd, and himself expell'd;
" Let him for succour sue from place to place,
" Torn from his subjects and his son's embrace," &c.

King Charles seeming concerned at this accident, the lord Falkland, who observed it, would likewise try his own fortune in the same manner; hoping he might fall upon some passage that could have no relation to his case, and thereby divert the king's thoughts from any impression the other might make upon him: but the place lord Falkland stumbled upon was yet more suited to his destiny than the other had been to the king's; being the following expressions of Evander, upon the untimely death of his son Pallas, Æn. xi. 152.

" O Pallas! thou hast fail'd thy plighted word.
" To fight with caution, not to tempt the sword,
" I warn'd thee, but in vain: for well I knew
" What perils youthful ardour would pursue;
" That boiling blood would carry thee too far;
" Young as thou wert in dangers, raw to war.
" O curst essay of arms, disastrous doom,
" Prelude of bloody fields and fights to come!"

He wrote several things, both poetical and political; and in some of the king's declarations, supposed to be penned by lord Falkland, we find the first regular definition of the English constitution that occurs in any composition published by authority. His predecessor, the first viscount Cary, was ennobled for being the first who gave king James an account of queen Elizabeth's death.

CARY (Robert), a learned English chronologer, born in Devonshire about the year 1615. On the restoration, he was preferred to the archdeaconry of Exeter; but on some pretext was ejected in 1664, and spent the rest of his days at his rectory of Portle-mouth, where he died in 1688. He published *Pala-logia Chronica*, a chronology of ancient times, in three parts, didactical, apodeictical, and canonical; and translated the hymns of the church into Latin verse.

CARYATES, in antiquity, a festival in honour of Diana surnamed *Caryatis*, held at Caryum, a city of Laconia. The chief ceremony was a certain dance said to have been invented by Castor and Pollux, and per-

formed by the virgins of the place. During Xerxes's invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the anger of the goddesses by such an intermission, the neighbouring swains are said to have assembled and sung pastorals or *bucolicæ*, which is said to have been the origin of *bucolic* poetry.

CARYATIDES, or CARAITES. See ARCHITECTURE, n° 56.

CARYL (Joseph), a divine of the last century, bred at Oxford, and some time preacher to the society of Lincoln's inn, an employment he filled with much applause. He became a frequent preacher before the long parliament, a licenser of their books, one of the assembly of divines, and one of the triers for the approbation of ministers; in all which capacities he showed himself a man of considerable parts and learning, but with great zeal against the king's person and cause. On the restoration of Charles II. he was silenced by the act of uniformity, and lived privately in London, where, besides other works, he distinguished himself by a laborious *Exposition of the Book of Job*; and died in 1672.

CARYLL (John), a late English poet, was of the Roman Catholic persuasion, being secretary to queen Mary the wife of James II. and one who followed the fortunes of his abdicating master; who rewarded him, first with knighthood, and then with the honorary titles of earl Caryll and baron Dartford. How long he continued in that service is not known; but he was in England in the reign of queen Anne, and recommended the subject of the "Rape of the Lock" to Mr Pope, who at its publication addressed it to him. He was also the intimate friend of Pope's "Unfortunate Lady." He was the author of two plays: 1. "The English Princess, or the Death of Richard III. 1667," 4to.; 2. "Sir Salomon, or the Cautious Coxcomb, 1671," 4to.; and in 1700, he published "The Psalms of David, translated from the Vulgate," 12mo. In Tonson's edition of Ovid's Epistles, that of "Briseis to Achilles" is said to be by Sir John Caryll; and in Nichols's Select Collection of Miscellaneous Poems, vol. II. p. 1. the first Eclogue of Virgil is translated by the same ingenious poet. He was living in 1717, and at that time must have been a very old man. See three of his letters in the "Additions to Pope," vol. II. p. 114.

CARYOCAR, in botany: A genus of the tetragynia order, belonging to the polyandria class of plants. The calyx is quinquepartite, the petals five, the styles more frequently four. The fruit is a plum, with nucleusses, and four furrows netted.

CARYOPHYLLÆI, in botany, the name of a very numerous family or order in Linnæus's fragments of a natural method: containing, besides the class of the same name in Tournefort, many other plants, which from their general appearance seem pretty nearly allied to it. The following are the genera, viz. Agrostema, Cucubalus, Dianthus, Drypis, Gypsophila, Lychnis, Saponaria, Silene, Velazia, Alfine, Arenaria, Bufonia, Cerastium, Cherleria, Glinus, Holosteum, Loefflingia, Moehringia, Polycarpon, Sagina, Spergula, Stellaria, Minuartia, Mollugo, Ortegia, Pharnaceum, Queria. All the plants of this order are herbaceous,

Caryatides
||
Caryophyl-
læi.

Caryophyl-
lus.

and mostly annual. Some of the creeping kinds do not rise an inch, and the tallest exceed not seven or eight feet. See BOTANY, sect. vi. 22.

CARYOPHYLLUS, the PINK, in botany. See DIANTHUS.

CARYOPHYLLUS, the CLOVE-TREE, in botany: A genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 19th order, *Hesperideæ*. The corolla is tetrapetalous; the calyx tetraphyllous; the berry monospermous below the receptacle of the flower. Of this there is but one species, viz. the aromaticus, which is a native of the Molucca islands, particularly of Amboyna, where it is principally cultivated. The clove-tree resembles, in its bark, the olive; and is about the height of the laurel, which it also resembles in its leaves. No verdure is ever seen under it. It has a great number of branches, at the extremities of which are produced vast quantities of flowers, that are first white, then green, and at last pretty red and hard. When they arrive at this degree of maturity, they are, properly speaking, *cloves*. As they dry, they assume a dark yellowish cast; and, when gathered, become of a deep brown. The season for gathering the cloves is from October to February. The boughs of the trees are then strongly shaken, or the cloves beat down with long reeds. Large cloths are spread to receive them, and they are afterwards either dried in the sun or in the smoke of the bamboo-cane. The cloves which escape the notice of those who gather them, or are purposely left upon the tree, continue to grow till they are about an inch in thickness; and these falling off, produce new plants, which do not bear in less than eight or nine years. Those which are called *mother-cloves* are inferior to the common sort; but are preserved in sugar by the Dutch; and, in long voyages, eat after their meals, to promote digestion.

The clove, to be in perfection, must be full sized, heavy, oily, and easily broken; of a fine smell, and of a hot aromatic taste, so as almost to burn the throat. It should make the fingers smart when handled, and leave an oily moisture upon them when pressed. In the East Indies, and in some parts of Europe, it is so much admired as to be thought an indispensable ingredient in almost every dish. It is put into their food, liquors, wines, and enters likewise the composition of their perfumes. Considered as medicines, cloves are very hot, stimulating, aromatics; and possess in an eminent degree the general virtues of substances of this class. Their pungency resides in their resin; or rather in a combination of resin with essential oil: for the spirituous extract is very pungent; but if the oil and the resin contained in this extract are separated from each other by distillation, the oil will be very mild; and any pungency which it does retain, proceeds from some small portion of adhering resin, and the remaining resin will be insipid. No plant, or part of any plant, contains such a quantity of oil as cloves do. From 16 ounces Newman obtained by distillation two ounces and two drams, and Hoffman obtained an ounce and an half of oil from two ounces of the spice. The oil is specifically heavier than water. Cloves acquire weight by imbibing water; and this they will do at some considerable distance. The

Dutch, who trade in cloves, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of cloves is ordered, they hang it, for several hours before it is sent in, over a vessel of water, at about two feet distance from the surface. This will add many pounds to the weight, which the unwary purchaser pays for on the spot. This is sometimes practised in Europe, as well as in the spice islands: but the degree of moisture must be more carefully watched in the latter; for there a bag of cloves will, in one night's time, attract so much water, that it may be pressed out of them by squeezing them with the hand.

The clove tree is never cultivated in Europe. At Amboyna the company have allotted the inhabitants 4000 parcels of land, on each of which they were at first allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually on an average more than two pounds of cloves; and consequently the collective produce must weigh more than a million. The cultivator is paid with the specie that is constantly returned to the company, and receives some unbleached cottons which are brought from Coromandel.

CARYOTA, in botany: A genus belonging to the natural order of *Palmeæ*. The male calyx is common, the corolla tripartite; the stamina very numerous: the female calyx the same; the corolla tripartite; one pestil, and a dispermous berry.

CASA, in ancient and middle-age writers, is used to denote a cottage or house.

Casa Santa, denotes the chapel of the holy virgin at Loretto.—The *Santa Casa* is properly the house, or rather chamber, in which the blessed virgin is said to have been born, where she was betrothed to her spouse Joseph, where the angel saluted her, the Holy Ghost overshadowed her, and by consequence where the Son of God was conceived or incarnated. Of this building the Catholics tell many wonderful stories too childish to transcribe. The *Santa Casa* or holy chamber consists of one room, forty-four spans long, eighteen broad, and twenty-three high. Over the chimney, in a niche, stands the image called the great *Madona* or Lady, four feet high, made of cedar, and, as they say, wrought by St Luke, who was a carver as well as a physician. The mantle or robe she has on, is covered with innumerable jewels of inestimable value. She has a crown, given her by Louis XIII. of France, and a little crown for her son.

CASAL, a strong town of Italy in Mountferrat, with a citadel and a bishop's see. It was taken by the French from the Spaniards in 1640; and the duke of Mantua sold it to the French in 1681. In 1695 it was taken by the allies, who demolished the fortifications; but the French retook it, and fortified it again. The king of Sardinia became master of it in 1706, from whom the French took it in 1745; however, the king of Sardinia got possession again in 1746. It is seated on the river Po, in E. Long. 8. 37. N. Lat. 54. 7.

CASAL-Maggiore, a small strong town of Italy, in the duchy of Milan, seated on the river Po. E. Long. 11. 5. N. Lat. 45. 6.

CASA-NOVA (Marc Antony), a Latin poet, born

Caryota
||
Casa-Nova.

Casan at Rome, succeeded particularly in epigrams. The poems he composed in honour of the illustrious men of Rome are also much esteemed. He died in 1527.

CASAN, a considerable town of Asia, and capital of a kingdom of the same name in the Russian empire, with a strong castle, a citadel, and an archbishop's see. The country about it is very fertile in all sorts of fruits, corn, and pulse. It carries on a great trade in furs, and furnishes wood for the building of ships. The kingdom of Casan is bounded on the north by Permian, on the east by Siberia, on the south by the river Wolga, and on the west by the province of Moscow. E. Long. 53. 25. N. Lat. 55. 38.

CASAS (Bartholomew de las), bishop of Chiapa, distinguished for his humanity and zeal for the conversion of the Indians, was born at Seville in 1474; and went with his father, who sailed to America with Christopher Columbus in 1493. At his return to Spain he embraced the state of an ecclesiastic, and obtained a curacy in the island of Cuba; but some time after quitted his cure in order to procure liberty for the Indians, whom he saw treated by the Spaniards in the most cruel and barbarous manner, which naturally gave them an unconquerable aversion to Christianity. Bartholomew exerted himself with extraordinary zeal, for 50 years together, in his endeavours to persuade the Spaniards that they ought to treat the Indians with equity and mildness; for which he suffered a number of persecutions from his countrymen. At last the court, moved by his continual remonstrances, made laws in favour of the Indians, and gave orders to the governors to observe them, and see them executed*. He died at Madrid in 1566, aged 92. He wrote several works, which breathe nothing but humanity and virtue. The principal of them are, 1. An account of the destruction of the Indies. 2. Several treatises in favour of the Indies, against Dr Sepulveda, who wrote a book to justify the inhuman barbarities committed by the Spaniards. 3. A very curious, and now scarce, work in Latin, on this question, "Whether kings or princes can, consistently with conscience, or in virtue of any right or title, alienate their subjects, and place them under the dominion of another sovereign?"

CASATI (Paul), a learned Jesuit, born at Placentia in 1617, entered early among the Jesuits; and, after having taught mathematics and divinity at Rome, was sent into Sweden to queen Christina, whom he prevailed on to embrace the popish religion. He wrote, 1. *Vacuum proscriptum*. 2. *Terra machinis mota*. 3. *Mechanicorum, libri octo*. 4. *De Igne Dissertationes*; which is much esteemed. 5. *De Angelis Disputatio Theolog.* 6. *Hydrostaticæ Dissertationes*. 7. *Opticæ Dissertationes*: It is remarkable that he wrote this treatise on optics at 88 years of age, and after he was blind. He also wrote several books in Italian.

CASAUBON (Isaac), was born at Geneva in 1559; and Henry IV. appointed him his library-keeper in 1603. After this prince's death, he went into England with Sir Henry Wotton, ambassador from King James I. where he was kindly received and engaged in writing against Baronius's annals: he died not long after this, in 1614; and was interred in Westminster-

abbey, where a monument was erected to him. He was greatly skilled in the Greek, and in criticism; published several valuable commentaries; and received the highest elogiums from all his contemporaries.

CASAUBON (Meric), son of the preceding, was born at Geneva in 1599. He was bred at Oxford, and took the degree of master of arts in 1621. The same year he published a book in defence of his father against the calumnies of certain Roman Catholics; which gained him the favour of King James I. and a considerable reputation abroad. He was made prebendary of Canterbury by archbishop Laud. In the beginning of the civil war he lost all his spiritual promotions, but still continued to publish excellent works. Oliver Cromwell, then lieutenant-general of the parliament's forces, would have employed his pen in writing the history of the late war; but he declined it, owning, that his subject would oblige him to make such reflections as would be ungrateful, if not injurious, to his lordship. Notwithstanding this answer, Cromwell, sensible of his worth, ordered three or four hundred pounds to be paid him by a bookseller in London whose name was Cromwell, on demand, without requiring from him any acknowledgment of his benefactor. But this offer he rejected, though his circumstances were then mean. At the same time it was proposed by his friend Mr Greaves, who belonged to the library at St James's, that, if Casaubon would gratify Cromwell in the request above mentioned, all his father's books which were then in the royal library, having been purchased by King James, should be restored to him, and a pension of 300 l. a-year paid to the family as long as the youngest son of Dr Casaubon should live; but this also was refused. He likewise refused handsome offers from Christina queen of Sweden, being determined to spend the remainder of his life in England. At the restoration he recovered all his preferments, and continued writing till his death in 1671. He was the author of an English translation of Marcus Aurelius Antoninus's meditations, and of Lucius Florus; editions of several of the classics, with notes; a treatise of use and custom; a treatise of enthusiasm: with many other works; and he left a number of MSS. to the university of Oxford.

CASAURINA, in botany: A genus of the monandria order, belonging to the monoecia class of plants. The male has the calyx of the amentum; the corolla a bipartite small scale. The female has a calyx of the amentum, no corolla; the style bipartite.

CASCADE, a steep fall of water from a higher into a lower place. The word is French, formed of the Italian *cascata*, which signified the same; of *cascare*, to fall; and that from the Latin *cadere*.

Cascades are either natural, as that at Tivoli, &c. or artificial, as those of Versailles, &c. and either falling with gentle descent, as those of Sceaux; or in form of a buffet, as at Trianon; or down steps, in form of a perron, as at St Clou; or from basin to basin, &c.

CASCAIS, a town of Estremadura in Portugal, situated at the mouth of the river Tagus, 17 miles east of Lisbon. W. Long. 10. 15. N. Lat. 38. 40.

CASCARILLA. See CLUTIA and CROTON.

CASE, among grammarians, implies the different inflections

Casaubon
||
Case.

* See the
article
Mexico.

Cafe
||
Cashel.

inflections or terminations of nouns, serving to express the different relations they bear to each other, and to the things they represent. See GRAMMAR.

CASE also denotes a receptacle for various articles; as a case of knives, of lancets, of pistols, &c.

CASE, in printing, a large flat oblong frame placed aslope, divided into several compartments or little square cells; in each of which are lodged a number of types or letters of the same kind, whence the compositor takes them out, each as he needs it, to compose his matter. See PRINTING.

CASE is also used for a certain numerous quantity of divers things. Thus a case of crown-glasses contains usually 24 tables, each table being nearly circular, and about three feet six inches diameter; of Newcastle glasses, 35 tables; of Normandy glasses, 25.

CASE-HARDENING of Iron, is a superficial conversion of that metal into steel, by the ordinary method of conversion, namely by cementation with vegetable or animal coals. This operation is generally practised upon small pieces of iron wrought into tools and instruments to which a superficial conversion is sufficient; and it may be performed conveniently by putting the pieces of iron to be case-hardened, together with the cement, into an iron box, which is to be closely shut and exposed to a red heat during some hours. By this cementation a certain thickness from the surface of the iron will be converted into steel, and a proper hardness may be afterwards given by sudden extinction of the heated pieces of converted iron in a cold fluid. See STEEL.

CASE-Shot, in the military art, musket-balls, stones, old iron, &c. put into cases, and shot out of great guns.

CASEMENT, or CASEMATE, in architecture, a hollow moulding, which some architects make one-sixth of a circle, and others one-fourth.

CASEMENT is also used in building, for a little moveable window, usually within a larger, being made to open or turn on hinges.

CASERN, in fortification, lodgings built in garrison-towns, generally near the rampart, or in the waste places of the town, for lodging soldiers of the garrison. There are usually two beds in each casern for six soldiers to lie, who mount the guard alternately; the third part being always on duty.

CASERTA, an episcopal town of Italy in the kingdom of Naples, and in the Terra di-Lavoro, with the title of a duchy, seated at the foot of a mountain of the same name, in E. Long. 15. 5. N. Lat. 41. 5.

CASES (Peter-James), of Paris, the most eminent painter of the French school; the churches of Paris and of Versailles abound with his works. He died in 1754, aged 79.

CASH, in a commercial style, signifies the stock or ready money which a merchant or other person has in his present disposal to negotiate; so called from the French term *caisse*, i. e. *chest* or *coffer* for the keeping of money.

M. Savary shows, that the management of the cash of a company is the most considerable article, and that whereon its good or ill success chiefly depends.

CASH-Book. See BOOK-KEEPING.

CASHEL, or CASHIL, a town of Ireland in the county of Tipperary, and province of Munster, with

an archbishop's see. The ruins of the old cathedral testify its having been an extensive as well as handsome Gothic structure, boldly towering on the celebrated rock of Cashel, which taken together form a magnificent object, and bear honourable testimony to the labour and ingenuity, as well as the piety and zeal, of its former inhabitants. It is seen at a great distance, and in many directions. Adjoining it are the ruins of the chapel of Cormac M'Culinan, at once king and archbishop of Cashel, supposed to be the first stone building in Ireland; and seems, by its rude imitation of pillars and capitals, to have been copied after the Grecian architecture, and long to have preceded that which is usually called Gothic. Cormac M'Culinan was a prince greatly celebrated by the Irish historians for his learning, piety, and valour. He wrote, in his native language, a history of Ireland, commonly called the *Psalter of Cashel*, which is still extant, and contains the most authentic account we have of the annals of the country to that period, about the year 900. On the top of the rock of Cashel, and adjoining the cathedral, is a lofty round tower, which proudly defied the too successful attempts of archbishop Price, who in this century unroofed and thereby demolished the ancient cathedral founded by St Patrick. In the choir are the monuments of Myler Magrath, archbishop of this see, in the reign of queen Elizabeth, and some other curious remains of antiquity. Cashel was formerly the royal seat and metropolis of the kings of Munster; and on the ascent to the cathedral is a large stone on which every new king of Munster was, as the inhabitants report from tradition, solemnly proclaimed. Cashel is at present but small to what we may suppose it to have been in ancient days. The archbishop's palace is a fine building. Here is a very handsome market house, a sessions house, the county infirmary, a charter school for twenty boys and the same number of girls, and a very good barrack for two companies of foot. The present archbishop Dr Agar hath finished a very elegant church begun by his predecessor. W. Long. 7. 36. N. Lat. 52. 16.

CASHEW-NUT. See ANACARDIUM.

CASHIER, the cash-keeper; he who is charged with the receiving and paying the debts of a society.—In the generality of foundations, the cashier is called *treasurer*.

CASHIERS of the Bank, are officers who sign the notes that are issued out, examine and mark them when returned for payment, &c.

CASHMIRE, a province of Asia in the dominions of the Mogul. It is situated at the extremity of Hindostan, northward of Lahore, and is bounded on the one side by a ridge of the great Caucasus, and on the other by the little Tartarian Thibet and Moultan. The extent of it is not very considerable; but being girt in by a zone of hills, and elevated very considerably above an arid plain, which stretches many miles around it, the scenes which it exhibits are wild and picturesque. Rivers, hills, and valleys, charmingly diversify the landscape. Here, Mr Sullivan† informs us,† *Philos.* a cascade rushes from a foaming precipice; there a *phical* tranquil stream glides placidly along; the tinkling rill, *Rhapsodie* too, sounds amidst the groves; and the feathered choristers sing the song of love, close sheltered in the glade.

Cashmere
Casing.

Cask
||
Casson.

At what time Cashmere came under the dominion of the Mogul government, and how long, and in what manner it was independent, before it was annexed to the territories of the house of Timur, are points that are beyond our present purpose. Though inconsiderable as to its revenues, it was uniformly held in the highest estimation by the emperors of Hindostan. Thither they repaired, in the plenitude of their greatness, when the affairs of state would admit of their absence; and there they divested themselves of form and all the oppressive ceremony of state. The royal manner of travelling to Cashmere was grand, though tedious and unwieldy, and showed, in an eminent degree, the splendour and magnificence of an eastern potentate. Aurungzebe, we are told, seldom began his march to that country, for a march certainly it was to be called, without an escort of 80,000 or 100,000 fighting men, besides the gentlemen of his household, the attendants of his seraglio, and most of his officers of state. These all continued with him during the time he was on the road, which generally was a month: but no sooner was he arrived at the entrance of those aerial regions, than, with a select party of friends, he separated from the rest of his retinue, and with them ascended the defiles which led him to his Eden.

The temperature of the air of Cashmere, elevated as it is so much above the adjoining country, together with the streams which continually pour from its mountains, enables the husbandman to cultivate with success the soil he appropriates to agriculture; whilst the gardener's labour is amply repaid in the abundant produce of his fruit. In short, nature wears her gayest cloathing in this enchanting spot. The rivers supply the inhabitants with almost every species of fish; the hills yield sweet herbage for the cattle; the plains are covered with grain of different denominations; and the woods are stored with variety of game. The Cashmireans, according to our author, seem a race distinct from all others in the East: their persons are more elegant, and their complexions more delicate and more tinged with red.

On the decadence of the Mogul power in Hindostan, Cashmere felt some of the ravages of war. It is now however in peace; and the inhabitants are desirous of keeping it so. They are sprightly and ingenious; and have several curious manufactures much valued in India. They are all Mahometans or Idolaters. Cashmere is the capital town.

CASIMIR, the name of several kings of Poland. See (*History of*) POLAND.

CASIMIR (Matthias Sorbiewski), a Polish Jesuit, born in 1597. He was a most excellent poet; and is, says M. Baillet, an exception to the general rule of Aristotle and the other ancients, which teaches us to expect nothing ingenious and delicate from northern climates. His odes, epodes, and epigrams, have been thought not inferior to those of the finest wits of Greece and Rome. Dr Watts has translated one or two of his small pieces, which are added to his Lyric Poems. He died at Warsaw in 1640, aged 43. There have been many editions of his poems, the best of which is that of Paris, 1759.

CASING of TIMBER-WORK, among builders, is the plastering the house all over the outside with mortar, and then striking it while wet by a ruler, with

the corner of a trowel, to make it resemble the joints of free-stone. Some direct it to be done upon heart-laths, because the mortar would, in a little time, decay the sap-laths; and to lay on the mortar in two thicknesses, viz. a second before the first is dry.

CASK, a piece of defensive armour wherewith to cover the head and neck; otherwise called the *head-piece* and *helmet**. The word is French, *casque*, from *casque* or *cassicus*, a diminutive of *cassis* a helmet. Le Gendre observes, that anciently, in France, the gens d'arms all wore *casks*. The king wore a *cask* gilt; the dukes and counts silvered; gentlemen of extraction polished steel; and the rest plain iron.

The cask is frequently seen on ancient medals, where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most ancient of all the coverings of the head, as well as the most universal. Kings, emperors, and even gods themselves, are seen therewith. That which covers the head of Rome has usually two wings like those of Mercury: and that of some kings is furnished with horns like those of Jupiter Ammon; and sometimes barely bulls or rams horns, to express uncommon force.

CASK, in heraldry, the same with helmet. See HERALDRY, B^o 45.

CASK, a vessel of capacity, for preserving liquors of divers kinds; and sometimes also dry goods, as sugar, almonds, &c.—A cask of sugar is a barrel of that commodity, containing from eight to eleven hundred weight. A cask of almonds is about three hundred weight.

CASKET, in a general sense, a little coffer or cabinet. See CABINET.

CASKETS, in the sea language, are small ropes made of finnet, and fastened to gromets, or little rings upon the yards; their use is to make fast the sail to the yard when it is to be furled.

CASLON (William), eminent in an art of the greatest consequence to literature, the art of letter-founding, was born in 1692, in that part of the town of Hales Owen which is situated in Shropshire. Tho' he justly attained the character of being the Coryphæus in that employment, he was not brought up to the business; and it is observed by Mr Mores, that this handy-work is so concealed among the artificers of it, that he could not discover that any one had taught it to another, but every person who had used it had learned it of his own genuine inclination. Mr Caslon served a regular apprenticeship to an engraver of ornaments on gun-barrels; and after the expiration of his term, carried on this trade in Vine-street, near the Minories. He did not, however, solely confine his ingenuity to that instrument; but employed himself likewise in making tools for the book-binders, and for the chasing of silver plate. Whilst he was engaged in this business, the elder Mr Bowyer accidentally saw, in a bookfeller's shop, the lettering of a book uncommonly neat; and inquiring who the artist was by whom the letters were made, was hence induced to seek an acquaintance with Mr Caslon. Not long after, Mr Bowyer took Mr Caslon to Mr James's foundery, in Bartholomew-close. Caslon had never before that time seen any part of the business; and being asked by his friend, if he thought he could undertake to cut types,

Caslon,
Caspian.

he requested a single day to consider the matter, and then replied that he had no doubt but he could. Upon this answer, Mr Bowyer, Mr Bettenham, and Mr Watts had such a confidence in his abilities, that they lent him 500*l.* to begin the undertaking, and he applied himself to it with equal assiduity and success. In 1720, the society for promoting Christian knowledge, in consequence of a representation from Mr Solomon Negri, a native of Damascus in Syria, who was well skilled in the Oriental tongues, and had been professor of Arabic in places of note, deemed it expedient to print, for the use of the Eastern churches, the New Testament and Psalter in the Arabic language. These were intended for the benefit of the poor Christians in Palestine, Syria, Mesopotamia, Arabia, and Egypt, the constitution of which countries did not permit the exercise of the art of printing. Upon this occasion Mr Caslon was pitched upon to cut the fount; in his specimens of which he distinguished it by the name of English Arabic. Under the farther encouragement of Mr Bowyer, Mr Bettenham, and Mr Watts, he proceeded with vigour in his employment; and he arrived at length to such perfection, that he not only freed us from the necessity of importing types from Holland, but in the beauty and elegance of those made by him he so far exceeded the productions of the best artificers, that his workmanship was frequently exported to the Continent. In short, his foundery became, in process of time, the most capital one that exists in this or in foreign countries. Having acquired opulence in the course of his employment, he was put into the commission of the peace for the county of Middlesex. Towards the latter end of his life, his eldest son being in partnership with him, he retired in a great measure from the active execution of business. His death happened in January 1766.

CASPIAN SEA, a large lake of salt-water in Asia, bounded by the province of Astrakan on the north, and by part of Persia on the south, east, and west. It is upwards of 400 miles long from south to north, and 300 broad from east to west. This sea forms several gulfs, and embraces between Astrakan and Astrabad an incredible number of small islands. Its bottom is mud, but sometimes mixed with shells. At the distance of some German miles from land it is 500 fathoms deep; but on approaching the shore it is every where so shallow, that the smallest vessels, if loaded, are obliged to remain at a distance.

When we consider that the Caspian is inclosed on all sides by land, and that its banks are in the neighbourhood of very high mountains, we easily see why the navigation in it should be perfectly different from that in every other sea. There are certain winds that domineer over it with such absolute sway, that vessels are often deprived of every resource; and in the whole extent of it there is not a port that can truly be called safe. The north, north-east, and east winds, blow most frequently, and occasion the most violent tempests. Along the eastern shore the east winds prevail; for which reason vessels bound from Persia to Astrakan always direct their course along this shore.

Although the extent of the Caspian Sea is immense, the variety of its productions is exceedingly small. This undoubtedly proceeds from its want of communication with the ocean, which cannot impart to it any

N^o 66.

portion of its inexhaustible stores. But the animals which this lake nourishes multiply to such a degree, that the Russians, who alone are in condition to make them turn to account, justly consider them as a never failing source of profit and wealth. It will be understood that we speak of the fish of the Caspian and of its fisheries, which make the sole occupation and principal trade of the people inhabiting the banks of the Wolga and of the Jaik. This business is distinguished into the great and lesser fisheries. The fish comprehended under the first division, such as the sturgeon and others, abound in all parts of the Caspian as well as in the rivers that communicate with it, and which they ascend at spawning-time. The small fishes, such as the salmon and many others, observe the general law of quitting the salt waters for the fresh, nor is there an instance of one of them remaining constantly in the sea.

Seals are the only quadrupeds that inhabit the Caspian; but they are there in such numbers as to afford the means of subsistence to many people in that country as well as in Greenland. The varieties of the species are numerous, diversified, however, only by the colour. Some are quite black, others quite white; there are some whitish, some yellowish, some of a mouse-colour, and some streaked like a tiger. They crawl by means of their fore-feet upon the islands, where they become the prey of the fishermen, who kill them with long clubs. As soon as one is dispatched, he is succeeded by several who come to the assistance of their unhappy companion, but come only to share his fate. They are exceedingly tenacious of life, and endure more than thirty hard blows before they die. They will even live for several days after having received many mortal wounds. They are most terrified by fire and smoke; and as soon as they perceive them, retreat with the utmost expedition to the sea. These animals grow so very fat, that they look rather like oil-bags than animals. At Astrakan is made a sort of grey soap with their fat mixed with pot-ashes, which is much valued for its property of cleansing and taking grease from woollen stuffs. The greatest numbers of them are killed in spring and autumn. Many small vessels go from Astrakan merely to catch seals.

If the Caspian has few quadrupeds, it has in proportion still fewer of those natural productions which are looked upon as proper only to the sea. There have never been found in it any zoophytes, nor any animal of the order of molusca. The same may almost be said of shells; the only ones found being three or four species of cockle, the common muscle, some species of snails, and one or two others.

But to compensate this sterility, it abounds in birds of different kinds. Of those that frequent the shores there are many species of the goose and duck kind, of the stork and heron, and many others of the wader tribe. Of birds properly aquatic, it contains the grebe, the crested diver, the pelican, the cormorant, and almost every species of gull. Crows are so fond of fish, that they haunt the shores of the Caspian in prodigious multitudes.

The waters of this lake are very impure, the great number of rivers that run into it, and the nature of its bottom, affecting it greatly. It is true, that in general the waters are salt; but though the whole western shore extends

Caspian.

Caspian.

extends from the 46th to the 35th degree of north latitude, and though one might conclude from analogy that these waters would contain a great deal of salt, yet experiments prove the contrary: and it is certain that the saltness of this sea is diminished by the north, north-east, and north-west winds; although we may with equal reason conclude, that it owes its saltness to the mines of salt which lie along its two banks, and which are either already known or will be known to posterity. The depth of these waters also diminishes gradually as you approach the shores, and their saltness in the same way grows less in proportion to their proximity to the land, the north winds not unfrequently causing the rivers to discharge into it vast quantities of troubled water impregnated with clay. These variations which the sea is exposed to are more or less considerable according to the nature of the winds; they affect the colour of the river waters to a certain distance from the shore, till these mixing with those of the sea, which then resume the ascendancy, the fine green colour appears, which is natural to the ocean, and to all those bodies of water that communicate with it.

It is well known, that besides its salt taste, all sea-water has a sensible bitterness, which must be attributed not only to the salt itself, but to the mixture of different substances that unite with it, particularly to different sorts of alum, the ordinary effect of different combinations of acids. Besides this, the waters of the Caspian have another taste, bitter too, but quite distinct, which affects the tongue with an impression similar to that made by the bile of animals; a property which is peculiar to this sea, though not equally sensible at all seasons. When the north and north-west winds have raged for a considerable time, this bitter taste is sensibly felt; but when the wind has been south, very imperfectly. We shall endeavour to account for this phenomenon.

The Caspian is surrounded on its western side by the mountains of Caucasus, which extend from Derbent to the Black Sea. These mountains make a curve near Astrakan, and directing their course towards the eastern shore of the Caspian, lose themselves near the mouth of the Jaik, where they become secondary mountains, being disposed in strata. As Caucasus is an inexhaustible magazine of combustible substances, it consequently lodges an astonishing quantity of metals in its bowels. Accordingly, along the foot of this immense chain of mountains, we sometimes meet with warm springs, sometimes springs of naphtha of different quality; sometimes we find native sulphur, mines of vitriol, or lakes heated by internal fires. Now the foot of mount Caucasus forming the immediate western shore of the Caspian Sea, it is very easy to imagine that a great quantity of the constituent parts of the former must be communicated to the latter: but it is chiefly to the naphtha, which abounds so much in the countries which surround this sea, that we must attribute the true cause of the bitterness peculiar to its waters; for it is certain that this bitumen flows from the mountains, sometimes in all its purity, and sometimes mixed with other substances which it acquires in its passage through subterranean channels, from the most interior parts of these mountains to the sea, where it falls to the bottom by its specific gravity. It is certain too, that the north and north-west winds

VOL. IV. PART I.

detach the greatest quantities of this naphtha; whence it is evident that the bitter taste must be most sensible when these winds prevail. We may also comprehend why this taste is not so strong at the surface or in the neighbourhood of the shore, the waters there being less impregnated with salt, and the naphtha which is united with the water by the salt, being then either carried to a distance by the winds or precipitated to the bottom.

But it is not a bitter taste alone that the naphtha communicates to the waters of the Caspian: these waters were analysed by M. Gmelin, and found to contain, besides the common sea-salt, a considerable proportion of Glauber-salt, intimately united with the former, and which is evidently a production of the naphtha.

As the waters of the Caspian have no outlet, they are discharged by subterranean canals through the earth, where they deposit beds of salt; the surface of which corresponds with that of the level of the sea. The two great deserts which extend from it to the east and west are chiefly composed of a saline earth, in which the salt is formed by efflorescence into regular crystals; for which reason salt showers and dews are exceedingly common in that neighbourhood. The salt of the marshes at Astrakan, and that found in efflorescence in the deserts, is by no means pure sea-salt, but much debased by the bitter Glauber salt we mentioned above. In many places indeed it is found with crystals of a lozenge shape, which is peculiar to it, without any cubical appearance, the form peculiar to crystals of sea-salt.

A great deal has been written on the successive augmentation and decrease of the Caspian sea, but with little truth. There is indeed to be perceived in it a certain rise and fall of its waters; in which, however, no observation has ever discovered any regularity.

Many suppose (and there are strong presumptions in favour of the supposition), that the shores of the Caspian were much more extensive in ancient times than they are at present, and that it once communicated with the Black Sea. It is probable too, that the level of this last sea was once much higher than it is at present. If then it be allowed, that the waters of the Black Sea, before it procured an exit by the Straits of Constantinople, rose several fathoms above their present level, which from many concurring circumstances may easily be admitted; it will follow, that all the plains, of the Crimea, of the Kuman, of the Wolga, and of the Jaik, and those of Great Tartary beyond the lake of Arat, in ancient times formed but one sea, which embraced the northern extremity of Caucasus by a narrow strait of little depth; the vestiges of which are still obvious in the river Mantysch.

CASSADA. See JATROPHA.

CASSANA (Nicolo), called NICOLETTO, an eminent Italian painter, was born at Venice in 1659, and became a disciple of his father Giovanni Francesco Cassano, a Genoese, who had been taught the art of painting by Bernardino Strozzi. He soon distinguished himself not only by the beauty of his colouring, but by the gracefulness of his figures in historical compositions, as well as in portrait. The most eminent personages solicited him to enrich their cabinets with some of his performances; and were more particularly

F f

desirous

Cassana.

Cassana.

desirous to obtain their portraits, because in that branch he excelled beyond competition. The Grand Duke of Tuscany, who was an excellent judge of merit in all professions, and as liberal an encourager of it, invited Nicoletto to his court; and he there painted the portraits of that prince and the princess Violante his consort. Those performances procured him uncommon applause, as well as a noble gratuity, and he was employed and caressed by the principal nobility of Florence. Beside several historical subjects painted by this master while he resided in that city, one was a very capital design: The subject of it was the *Conspiracy of Catiline*; it consisted of nine figures as large as life, down to the knees; and the two principal figures were represented as with one hand joined in the presence of their companions, and in their other hand holding a cup of blood. Some of the English nobility on their travels sat to him for their portraits; which being sent to London, and highly admired, Nicoletto was invited to England, with strong assurances of a generous reception; and on his arrival he experienced the kindness, the respect, and the liberality, so peculiar to the natives of that kingdom. He had the honour of being introduced to the presence of queen Anne, and to paint her portrait; in which he succeeded so happily, that the queen distinguished him by many marks of favour and honour; but he had not the happiness to enjoy his good fortune for any length of time, dying in London, universally regretted, in the year 1713.

CASSANA (Giovanni Agostino), called *L'Abate Cassana*, was brother to the preceding, and born in 1664. He was educated along with him by their father Francesco Cassana; and he finished his studies at Venice, where his brother Nicolo resided for some time. Although he composed and designed historical subjects with expertness, and with a correctness of outline equal to his brother; yet from prudence and fraternal affection, he declined to interfere with him, and chose therefore to design and paint all sorts of animals and fruits. In that style he arrived at a high degree of excellence, imitating nature with exactness, beauty, and truth; expressing the various plumage of his birds, and the hairs of the different animals with such tenderness and delicacy as rendered them estimable to all judges and lovers of the art. His works were admitted into the collections of those of the first rank, and accounted ornaments of those repositories of what is curious or valuable. He also painted fruits of those kinds which were the most uncommon, or naturally of odd and singular colours; and such fishes as seemed worthy to excite admiration by their unusual form, colour, or appearance. But besides those subjects, he sometimes painted the portraits of particular persons of distinction, which he designed, coloured, and touched, with the same degree of merit that was visible in all his other performances. At last he determined to visit Genoa, where his family had lived in esteem; and took with him several pictures which he had already finished. His intention was to display his generosity, and to appear as a person of more wealth and of greater consequence than he really was; and to support that character, he bestowed his pictures to several of the principal nobility of that city. But, unhappily, he experienced no grateful return for all that prodigal

munificence: he reduced himself by that vain liberality to the most necessitous circumstances; was deprived of the means to procure for himself even the common necessities of life; and wasted away the remainder of his days in the bitterness of poverty, misery, and neglect.

CASSANDER, king of Macedon after Alexander the Great, was the son of Antipater. He made several conquests in Greece, abolished democracy at Athens, and gave the government of that state to the orator Demetrius. Olympias, the mother of Alexander, having caused Aridæus and his wife Euridyce, with others of Cassander's party, to be put to death; he besieged Pydne, whither the queen had retired, took it by a stratagem, and caused her to be put to death. He married Thessalonica the sister of Alexander the Great; and killed Roxana and Alexander, the wife and son of that conqueror. At length he entered into an alliance with Seleucus and Lyfimachus, against Antigonus and Demetrius; over whom he obtained a great victory near Ipsus in Phrygia, 301 years before the Christian æra, and died three years after, in the 19th year of his reign.

CASSANDRA, in fabulous history, the daughter of Priam and Hecuba, was beloved of Apollo, who promised to bestow on her the spirit of prophecy, provided she would consent to his love. Cassandra seemed to accept the proposal; but had no sooner obtained that gift, than she laughed at the tempter, and broke her word. Apollo, being enraged, revenged himself by causing no credit be given to her predictions; hence she in vain prophesied the ruin of Troy. Ajax, the son of Oileus, having ravished her in the temple of Minerva, he was struck with thunder. She fell into the hands of Agamemnon, who loved her to distraction; but in vain did she predict that he would be assassinated in his own country. He was killed, with her, by the intrigues of Clytemnestra; but their death was avenged by Orestes.

CASSANO, a town of Italy in the duchy of Milan, rendered remarkable by an obstinate battle fought there between the Germans and French in 1705. It is subject to the House of Austria, and is seated on the river Adda, in E. Long. 10. 0. N. Lat. 45. 20.

CASSANO, a town of Italy in Calabria citerior, in the kingdom of Naples, with a bishop's see. E. Long. 16. 30. N. Lat. 39. 55.

CASSAVI, or CASSADA. See JATROPHA.

CASSEL, a town of French Flanders, and capital of a chatellany of the same name: It is seated on a mountain, where the terrace of the castle is still to be seen; and from whence there is one of the finest prospects in the world; for one may see no less than 32 towns, with a great extent of the sea, from whence it is distant 15 miles. E. Long. 2. 27. N. Lat. 50. 48.

CASSEL, the capital city of the landgravate of Hesse-cassel, in the circle of the Upper Rhine in Germany; (see HESSE-CASSEL). It is divided into the Old, New, and High towns. The New Town is best built, the houses being of stone, and the streets broad. The houses of the Old Town, which is within the walls, are mostly of timber; but the streets are broad, and the market-places spacious. The place is strongly fortified, but the fortifications are not regular. It contains about 32,000 inhabitants, of whom a great proportion are French Protestants. These have established

Cassander

Cassel.

Cassia. ed several manufactories in the place, particularly in the woollen branch. It is seated on the declivity of a hill near the river Fulva, in E. Long. 9. 20. N. Lat. 51. 20.

CASSIA, in botany: A genus of the monogynia order, belonging to the decandria class of plants; and in the natural method ranking under the 33d order, *Lomentaceæ*. The calyx is pentaphyllous; petals five; antheræ upper, three barren; lower, three-beaked: a leguminous plant. There are 30 species, all of them natives of warm climates. The most remarkable are,

1. The fistula or purging cassia of Alexandria. It is a native of Egypt and both Indies, where it rises to the height of 40 or 50 feet, with a large trunk, dividing into many branches, garnished with winged leaves, composed of five pair of spear-shaped lobes, which are smooth, having many transverse nerves from the midrib to the border. The flowers are produced in long spikes at the end of the branches, each standing upon a pretty long foot-stalk; these are composed, like the former, of fine yellow concave petals, which are succeeded by cylindrical pods from one to two feet long, with a dark brown woody shell, having a longitudinal seam on one side, divided into many cells by transverse partitions, each containing one or two oval, smooth, compressed seeds, lodged in a blackish pulp, which is used in medicine. There are two sorts of this drug in the shops; one brought from the East Indies, the other from the West: the canes or pods of the latter are generally large, rough, thick-rinded, and the pulp nauseous; those of the former are less, smoother, the pulp blacker, and of a sweeter taste; this sort is preferred to the other. Such pods should be chosen as are weighty, new, and do not make a rattling noise (from the seeds being loose within them) when shaken. The pulp should be of a bright shining black colour, and a sweet taste, not harsh, which happens from the fruit being gathered before it has grown fully ripe, or fourish, which it is apt to turn upon keeping: it should neither be very dry nor very moist, nor at all mouldy; which, from its being kept in damp cellars or moistened, in order to increase its weight, it is very subject to be. Greatest part of the pulp dissolves both in water and in rectified spirit; and may be extracted from the cane by either. The shops employ water, boiling the bruised pod therein, and afterwards evaporating the solution to a due consistence. This pulp is a gentle laxative medicine, and frequently given, in a dose of some drams, in costive habits. Some direct a dose of two ounces or more as a cathartic, in inflammatory cases, where the more acrid purgatives have no place; but in these large quantities it generally nauseates the stomach, produces flatulencies, and sometimes gripings of the bowels, especially if the cassia be not of a very good kind: these effects may be prevented by the addition of aromatics, and exhibiting it in a liquid form. Geoffroy says, it does excellent service in the painful tension of the belly, which sometimes follows the imprudent use of antimonials; and that it may be advantageously acuated with the more acrid purgatives, or antimonial emetics, or employed to abate their force. Vallisneri relates, that the purgative virtue of this medicine is remarkably promoted by manna; that a mixture of four drams of cassia and two of manna, purges as much as twelve drams of cassia

or thirty-two of manna alone. Sennertus observes, that the urine is apt to be turned of a green colour by the use of cassia: and sometimes, where a large quantity has been taken, blackish. This drug gives name to an officinal electuary, and is an ingredient also in another.

2. The cassia fenna is a shrubby plant cultivated in Persia, Syria, and Arabia, for the leaves, which form a considerable article of commerce. They are of an oblong figure, sharp-pointed at the ends, about a quarter of an inch broad, and not a full inch in length, of a lively yellowish green colour, a faint not very disagreeable smell, and a subacid, bitterish, nauseous taste. They are brought from the above places, dried and picked from the stalks, to Alexandria in Egypt, and thence imported into Europe. Some inferior sorts are brought from Tripoli and other places; these may easily be distinguished by their being either narrower, longer, and sharper pointed; or larger, broader, and round pointed, with small prominent veins; or large and obtuse, of a fresh green colour, without any yellow cast. Senna is a very useful cathartic, operating mildly, and yet effectually; and, if judiciously dosed and managed, rarely occasioning the ill consequences which too frequently follow the exhibition of the stronger purges. The only inconveniences complained of in this drug are, its being apt to gripe, and its nauseous flavour. The griping quality depends upon a resinous substance, which, like the other bodies of this class, is naturally disposed to adhere to the coats of the intestines. The more this resin is divided by such matters as take off its tenacity, the less adhesive, and consequently the less irritating and griping it will prove; and the less it is divided, the more griping: hence fenna given by itself, or infusions made in a very small quantity of fluid, gripe severely, and purge less than when diluted by a large portion of suitable menstruum, or divided by mixing the infusion with oily emulsions. The ill flavour of this drug is said to be abated by the greater water-figwort: but we cannot conceive that this plant, whose smell is manifestly fetid and its taste nauseous and bitter, can at all improve those of fenna: others recommend bohea tea, though neither has this any considerable effect. The smell of fenna resides in its more volatile parts, and may be discharged by lightly boiling infusions of it made in water: the liquor thus freed from the peculiar flavour of the fenna, may be easily rendered grateful to the taste, by the addition of any proper aromatic tincture or distilled water. The colleges both of London and Edinburgh have given several formulæ for the exhibition of this article, such as those of infusion, powder, tincture, and electuary. The dose of fenna in substance, is from a scruple to a dram: in infusion, from one to three or four drams. It has been customary to reject the pedicles of the leaves of fenna as of little or no use: Geoffroy however observes, that they are not much inferior in efficacy to the leaves themselves. The pods or seed-vessels met with among the fenna brought to us, are by the college of Brussels preferred to the leaves: they are less apt to gripe, but proportionably less purgative.

CASSIA-Lignea. See LAURUS.

CASSIDA, in botany. SCUTELLARIA.

CASSIDA, in zoology, a genus of insects belonging

Cassiner
||
Cassine.
Plate
CXVI.

to the order of coleoptera. The feelers are like threads, but thicker on the outside; the elytra are marginated; and the head is hid under the thorax; from which last circumstance is derived the name of the genus. Foreign countries afford many fine species of them. Those we meet with in these parts have something singular. Their larva, by the help of the two prongs which are to be found at its hinder extremity, makes itself, with its own excrements, a kind of umbrella, that shelters it from the sun and rain. When this umbrella grows over-dry, it parts with it for a new one. This larva casts its slough several times. Thistles and verticillated plants are inhabited by these insects. There is one species, of which the remarkable chrysalis resembles an armorial escutcheon. It is that which produces our variegated cassida, and is a very singular one. Numbers of them are found on the side of ponds, upon the wild elecampane.

CASSIMER, or CASIMER, the name of a thin tweeled woollen cloth, much in fashion for summer use.

CASSIMIRE or CASHMIRE. See CASHMIRE.

CASSINE, in botany: A genus of the trigynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 23d order, *Dumosa*. The calyx is quinquepartite; the petals are five; and the fruit is a trispermous berry. There are three species, all of them natives of warm climates.

Of these the most remarkable is the *yapon*, which is a native of the maritime parts of Virginia and Carolina. It rises to the height of ten or twelve feet, sending out branches from the ground-upward, garnished with spear-shaped leaves placed alternately, which continue green through the year. The flowers are produced in close whorls round the branches, at the footstalks of the leaves; they are white, and divided into five parts, almost to the bottom. The berries are of a beautiful red colour, and as they continue most part of the winter upon the plants without being touched by the birds, we may reasonably conclude that they are possessed of a poisonous quality; as few of the wholesome innocent fruits escape their depredations. The Indians, however, have a great veneration for this plant, and at certain seasons of the year come in great numbers to fetch away the leaves. On such occasions their usual custom, says Miller, is to make a fire upon the ground, and, putting on it a great kettle full of water, they throw in a large quantity of yapon leaves; and when the water has boiled sufficiently, they drink large draughts of the decoction out of the kettle; which seldom fails to vomit them very severely. In this manner, however, they continue drinking and vomiting for three days together, until they imagine themselves sufficiently cleansed; they then gather every one a bundle of the shrub, and carry it home with them.—In the operation of these leaves by vomiting, those who have tasted of them say, that there is no uneasy sensation or pain. The matter discharged comes away in a full stream by the mouth, without any violence, or so much as disposing the patient to reach, or decline his head. The Spaniards who live near the gold mines of Peru, are frequently obliged to drink an infusion of this herb in order to moisten their breasts; without which they are liable to a sort of suffocation, from the strong metallic exhalations that are continually proceeding from the mines. In Para-

guay, the Jesuits make a great revenue by importing the leaves of this plant into many countries under the name of Paraguay or South-sea tea, which is there drank in the same manner as that of China or Japan is with us. It is with difficulty preserved in England.

CASSINI (Johannes Dominicus), a most excellent astronomer, born at Piedmont in 1635. His early proficiency in astronomy procured him an invitation to be mathematical professor at Bologna when he was no more than 15 years of age: and a comet appearing in 1652, he discovered that comets were not accidental meteors, but of the same nature, and probably governed by the same laws, as the planets. In the same year he solved a problem given up by Kepler and Bullialdus as insolvable, which was, to determine geometrically the apogee and eccentricity of a planet from its true and mean place. In 1663, he was appointed inspector-general of the fortifications of the castle of Urbino, and had afterwards the care of all the rivers in the ecclesiastical state: he still however prosecuted his astronomical studies, by discovering the revolution of Mars round his own axis; and, in 1666, published his theory of Jupiter's satellites. Cassini was invited into France by Louis XIV. in 1669, where he settled as the first professor in the royal observatory. In 1677 he demonstrated the line of Jupiter's diurnal rotation; and in 1684 discovered four more satellites belonging to Saturn, Huygens having found one before. He inhabited the royal observatory at Paris more than forty years; and when he died in 1712, was succeeded by his only son James Cassini.

CASSIODORUS (Marcus Aurelius), secretary of state to Theodoric king of the Goths, was born at Squillace, in the kingdom of Naples, about the year 470. He was consul in 514, and was in great credit under the reigns of Athalaric and Vitiges; but at seventy years of age retired into a monastery in Calabria, where he amused himself in making sun-dials, water hour-glasses, and perpetual lamps. He also formed a library; and composed several works, the best edition of which is that of father Garet, printed at Rouen in 1679. Those most esteemed are his Divine Institutions, and his treatise on the Soul. He died about the year 562.

CASSIOPEIA, in fabulous history, wife to Cepheus king of Ethiopia, and mother of Andromeda. She thought herself more beautiful than the Nereides, who desired Neptune to revenge the affront; so that he sent a sea-monster into the country, which did much harm. To appease the god, her daughter Andromeda was exposed to the monster, but was rescued by Perseus; who obtained of Jupiter, that Cassiopeia might be placed after his death among the stars: hence the constellation of that name.

CASSIOPEIA, in astronomy, one of the constellations of the northern hemisphere, situated next to Cepheus. In 1572, there appeared a new star in this constellation, which at first surpassed in magnitude and brightness Jupiter himself; but it diminished by degrees, and at last disappeared, at the end of eighteen months. It alarmed all the astronomers of that age, many of whom wrote dissertations on it; among the rest Tycho Brahe, Kepler, Maurolycus, Lycetus, Gramineus, &c. Beza, the landgrave of Hesse, Rosa, &c. wrote to prove it a comet, and the same which appeared to the Magi at the

Cassini
||
Cassiopeia.

Cassius
||
Cassimar.

the birth of Jesus Christ, and that it came to declare his second coming: they were answered on this subject by Tycho. The stars in the constellation Cassiopeia, in Ptolemy's Catalogue, are thirteen; in Hevelius's thirty-seven; in Tycho's, forty-six; but in the Britannic Catalogue, Mr Flamsteed makes them fifty-five.

CASSIS, in antiquity, a plated or metalline helmet; different from the *galea*, which was of leather.

CASSITERIA, in the history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin.

The cassiteria are of two kinds; the whitish pellucid cassiterion, and the brown cassiterion. The first is a tolerably bright and pellucid crystal, and seldom subject to the common blemishes of crystal: it is of a perfect and regular form, in the figure of a quadrilateral pyramid; and is found in Devonshire and Cornwall principally. The brown cassiterion is like the former in figure: it is of a very smooth and glossy surface, and is also found in great plenty in Devonshire and Cornwall.

CASSITERIDES (anc. geog.), a cluster of islands to the west of the Land's End; opposite to Celtiberia, (Pliny); famous for their tin, which he calls *candidum plumbum*; formerly open to none but the Phœnicians; who alone carried on this commerce from Gades, concealing the navigation from the rest of the world, (Strabo). The appellation is from *Cassiteros*, the name for tin in Greek. Now thought to be the Scilly Islands, or Sorlings, (Camden).

CASSIUS (Spurius), a renowned Roman general and consul, whose enemies accusing him of aspiring to royalty, he was thrown down from the Tarpeian rock, 485 years before Christ; after having thrice enjoyed the consular dignity, been once general of the horse under the first dictator that was created at Rome, and twice received the honour of a triumph.

CASSIUS (Longinus), a celebrated Roman lawyer, flourished 113 years before Christ. He was so inflexible a judge, that his tribunal was called the *Rock of the impeached*. It is from the judicial severity of this Cassius, that very severe judges have been called *Cassiani*.

CASSIUS (Caius), one of the murderers of Julius Cæsar: after his defeat by Mark Anthony at the battle of Philippi, he ordered one of his freed-men to put him to death with his own sword, 41 years before Christ. See ROME.

CASSOCK, or CASSULA, a kind of robe or gown, wore over the rest of the habit, particularly by the clergy. The word cassock comes from the French *casaque*, an horseman's coat.

CASSONADE, in commerce, cask sugar, or sugar put into casks or chests, after the first purification, but which has not been refined. It is sold either in powder or in lumps; the whitest, and that of which the lumps are largest, is the best. Many imagine it to sweeten more than loaf sugar; but it is certain that it yields a great deal more scum.

CASSOWARY, in ornithology. See STRUTHIO.

CASSUMAR, in the Materia Medica, a root approaching to that of zedoary.

It is cardiac and sudorific, and famous in nervous cases; it is also an ingredient in many compositions, and is prescribed in powders, boluses, and infusions. Its dose is from five to fifteen grains.

CASSUMBAZAR, a town of India, in Asia, situated on the river Ganges, in the province of Bengal. E. Long. 37. and N. Lat. 24.

Cassumba-
zar
||
Castagno.

CAST is peculiarly used to denote a figure or small statue of bronze. See BRONZE.

CAST, among founders, is applied to tubes of wax fitted in divers parts of a mould of the same matter; by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before possessed.

CAST, also denotes a cylindrical piece of brass or copper, slit in two, lengthwise, used by the founders in sand, to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be cast.

CAST, among plumbers, denotes a little brazen funnel at one end of a mould, for casting pipes without soldering, by means of which the melted metal is poured into the mould.

CAST, or *Caste*, in speaking of the eastern affairs, denotes a tribe, or number of families, of the same rank and profession. The division of a nation into casts chiefly obtains in the dominions of the Great Mogul, kingdom of Bengal, island of Ceylon, and the great peninsula opposite thereto. In each of these there are, according to father Martin, four principal casts, viz. the cast of the *bramins*, which is the first and most noble; the cast of the *rajas*, or princes, who pretend to be descended from divers royal families; the cast of the *choutres*, which comprehends all the artificers; and that of the *parias*, the lowest and most contemptible of all: though Henry Lord, it must be observed, divides the Indians about Surat into four casts, somewhat differently from Martin, viz. into *bramins*, or priests; *cuttery*, or soldiers; *shuddery*, which we call banians, or merchants; and *wyfe*, the mechanics or artificers. Every art and trade is confined to its proper cast, nor is allowed to be exercised by any but those whose fathers professed the same. So that a taylor's son can never rise to be a painter, nor a painter's son fall to be a taylor; though there are some employments that are proper to all the casts, e. g. every body may be a soldier, or a merchant. There are also divers casts which are allowed to till the ground, but not all. The cast of *parias* is held infamous, in so much that it is a disgrace to have any dealings or conversation with them; and there are some trades in the cast of *choutres*, which debase their professors almost to the same rank. Thus shoemakers, and all artificers in leather, as also fishermen, and even shepherds, are reputed no better than *parias*.

CASTAGNO (Andrea Dal), historical painter, was born at a small village called Castagno, belonging to the territory of Tuscany, in 1409; and being deprived of his parents, was employed by his uncle to attend the herds of cattle in the fields; but, having accidentally seen an ordinary painter at work in the country, he observed him for some time with surprise and attention, and afterwards made such efforts to imitate him, as astonished all who saw his productions. The extraordinary genius of Andrea became at last a common topic of discourse in Florence; and so far excited the curiosity of Bernardetto de Medici, that he sent for Andrea; and perceiving that he had promising talents, he placed him under the care of the

Castagno,
Castalio.

best masters who were at that time in Florence. Andrea diligently pursued his studies, devoted himself entirely to practice under the direction of his instructors, became particularly eminent in design, and in a few years made so great a progress, that he found as much employment as he could possibly execute. He painted only in distemper, and fresco, with a manner of colouring that was not very agreeable, being rather dry and hard; till he learned the secret of painting in oil from Domenico Venetiano, who had derived his knowledge of that new discovery from Antonello da Messina. Andrea was the first of the Florentine artists who painted in oil; but although he was in the highest degree indebted to Domenico for disclosing the secret, yet he secretly envied the merit of the man who taught him the art; and because his own works seemed to be much less admired than those of Domenico, he determined to assassinate his friend and benefactor. He executed his design with the utmost ingratitude and treachery (for Domenico at that time lived with him, and painted in partnership with him), and he stabbed him at a corner of a street so secretly, that he escaped unobserved, and unsuspected, to his own house, where he composedly sat down to work; and thither Domenico was soon after conveyed, to die in the arms of his murderer. The real author of so inhuman a transaction was never discovered, till Andrea, through remorse of conscience, disclosed it on his death-bed, in 1480. He finished several considerable works at Florence, by which he gained great riches, and as great a reputation; but when his villanous misconduct became public, his memory was ever after held in the utmost detestation. The most noted work of this master is in the hall of justice at Florence, representing the execution of the conspirators against the house of Medici.

CASTALIO (Sebastian), was born at Chetillon, on the Rhone, in the year 1515. Calvin conceived such an esteem and friendship for him, during the stay he made at Strasburg in 1540 and 1541, that he lodged him some days at his house, and procured him a regent's place in the college of Geneva. Castalio, after continuing in this office near three years, was forced to quit it in the year 1544, on account of some particular opinions which he held concerning Solomon's song, and Christ's descent into hell. He retired to Basil, where he was made Greek professor, and died in that place in 1564, aged 48. He incurred the high displeasure of Calvin and Theodore Beza, for differing with them concerning predestination and the punishment of heretics. His works are very considerable, both on account of their quality and number. In 1545, he printed at Basil four books of dialogues, containing the principal histories of the bible in elegant Latin; so that youth might thereby make a proficiency in piety and in the Latin tongue at the same time. But his principal work is a Latin and French translation of the scriptures. He began the Latin translation at Geneva in 1542, and finished it at Basil in 1550. It was printed at Basil in 1551, and dedicated by the author to Edward VI. king of England. The French version was dedicated to Henry II. of France, and printed at Basil in 1555. The fault which has been most generally condemned in his Latin translation, is the affectation of using only classical terms.

CASTALIUS FONS, (Strabo, Pausanias); *Castalia*, (Pindar, Virgil): A fountain at the foot of mount Parnassus, in Phocis, near the temple of Apollo, or near Delphi; sacred to the Muses, thence called *Castalides*. Its murmurs were thought prophetic, (Nonnus, Lucian.)

CASTANEA, in botany. See FAGUS.

CASTANETS, CASTAGNETTES, or CASTANET-TAS, a kind of musical instrument, wherewith the Moors, Spaniards, and Bohemians, accompany their dances, farabands, and guitars. It consists of two little round pieces of wood dried, and hollowed in manner of a spoon, the concavities whereof are placed on one another, fastened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadences. The *castanets* may be beat eight or nine times in the space of one measure, or second of a minute.

CASTANOVITZ, a town of Croatia, situated on the river Unna, which divides Christendom from Turkey. E. Long. 17. 20. N. Lat. 45. 40. It is subject to the House of Austria.

CASTEL (Lewis Betrand), a learned Jesuit, was born at Montpellier in 1688, and entered among the Jesuits in 1703. He studied polite literature in his youth; and at length applied himself entirely to the study of mathematics and natural philosophy. He distinguished himself by writing on gravity; the mathematics; and on the music of colours, a very whimsical idea, which he took great pains to reduce to practice. His piece on gravity, entitled *Traité de la Pensateur universelle*, was printed at Paris, in 1724. He afterwards published his *Mathématique universelle*; which occasioned his being unanimously chosen a fellow of the Royal Society of London, without the least solicitation. He was also a member of the academies of Bourdeaux and Rouen: but his *Clavecin oculaire* made the most noise; and he spent much time and expence in making an harpsichord for the eye, but without success. He also wrote for and against Sir Isaac Newton, and published several other works; the principal of which are, *Le Plan du Mathématique abrégé*, and a treatise entitled *Optique des Colours*. He led a very exemplary life, and died in 1757.

CASTELAMARA, a town of Italy, in the kingdom of Naples, and in the hither Principato, with a bishop's see, and a good harbour. E. Long. 14. 25. N. Lat. 41. 40.

CASTEL-ARAGONESE, a strong town of Italy, in the island of Sardinia, with a bishop's see, and a good harbour. It is seated on the N. W. coast of the island, in E. Long. 8. 57. N. Lat. 40. 56.

CASTEL-Branco, a town of Portugal, and capital of the province of Beira; seated on the river Lyra, 35 mile N. W. of Alcantara. W. Long. 8. 0. N. Lat. 39. 35.

CASTEL-Franco, a very small, but well-fortified frontier town of the Bolognese, in Italy, belonging to the Pope.

CASTEL-de-Vide, a small strong town of Alentejo. It was taken by Philip V. W. Long. 6. 25. N. Lat. 39. 15.

CASTEL-Folit, a town of Spain, in Catalonia, seated on an inaccessible eminence, between Gironne and Campredon.

Castalius
||
Castel Folit.

Castel Gandolfo, about 15 miles from each, and near the river Fulva.

Castellatio. *CASTEL-Gandolpho*, a town of Italy, in the territory of the church, with a castle, to which the Pope retires in the summer season; 10 miles S. by E. of Rome. E. Long. 12. 46. N. Lat. 41. 44.

CASTEL-NOVO, a strong town of Dalmatia, subject to the Venetians; seated on the gulph of Cataio, in E. Long. 18. 45. N. Lat. 42. 25.

CASTEL-Rodrigo, a town of Portugal, in the province of Tra-los-Montes, in W. Long. 7. 1. N. 41. 0.

CASTEL-NOVO-de-Carfagnana, a town of Italy, in the Modenese, with a strong fortress. It is the capital of the valley of Carfagnana; and seated on the river Serchio, 17 miles above Lucca.

CASTEL del Ovo, a small island in the Tuscan Sea, in the gulph of Naples, near a town of that name, to which it is joined by a stone bridge. The fortress is called Castel del Ovo, in which there is always a good garrison.

CASTELBAR, a town of Ireland, in the county of Mayo, and province of Connaught, 35 miles N. of Galway. W. Long. 9. 25. N. Lat. 53. 45.

CASTELL (Edmund) D.D. a learned English divine of the 17th century, distinguished by his skill in the eastern languages. He was educated at Cambridge; where he was master of Catharine hall, and Arabic professor; and was at length canon of Canterbury. He had the greatest share in the Polyglott bible of London; and wrote the *Heptaglotton pro septem Orientalibus*, &c. On this excellent work, which occupied a great part of his life, he bestowed incredible pains and expence, even to the breaking of his constitution, and exhausting of his fortune, having expended no less than 12,000*l.* upon that work. At length, when it was printed, the copies remained unfold upon his hands. He died in 1685; and lies buried in the church-yard of Higham Gobyon in Bedfordshire, of which he was rector. It appears from the inscription on his monument, which he erected in his lifetime, that he was chaplain to Charles II. He bequeathed all his oriental manuscripts to the university of Cambridge, on condition that his name should be written on every copy in the collection.

CASTELLA, a town of the Mantuan, in Italy, about five miles north-east of the city of Mantua. E. Long. 11. 15. N. Lat. 45. 30.

CASTELLAN, the name of a dignity or charge in Poland: The castellans are senators of the kingdom, but senators only of the lower class, who, in diets, sit on low seats, behind the palatines, or great senators. They are a kind of lieutenants of provinces, and command a part of the palatinate under the palatine.

CASTELLANY, the territory belonging to any city or town, chiefly used in France and Flanders: Thus we say, the castellany of Lisle, Ypres, &c.

CASTELLARIUS, the keeper, or curator, of a castellum. Gruter gives an ancient sepulchral inscription in memory of a *castellarius*.

CASTELLATIO, in middle age writers, the act of building a castle, or of fortifying a house, and rendering it a castle.—By the ancient English laws, castellation was prohibited without the king's especial licence.

CASTELLI (Bernard), an Italian painter, was born at Genoa in 1557; and excelled in colouring and in portraits. He was the intimate friend of Tasso, and took upon himself the task of designing and etching the figures of his Jerusalem Delivered. He died at Genoa in 1629.

Valerio Castelli, one of his sons, was born at Genoa in 1625, and surpassed his father. He particularly excelled in painting battles; which he composed with spirit, and executed them with so pleasing a variety, and so great freedom of hand, as gained him universal applause. His horses are admirably drawn, thrown into attitudes that are natural and becoming, full of motion, action, and life. In that style of painting he showed all the fire of Tintoretto, united with the fine taste of composition of Paolo Veronese. He died in 1659. The works of this master are not very frequent; but they are deservedly held in very high esteem. It is believed that a greater number of his easel pictures are in the collections of the nobility and gentry of England, than in any other part of Europe.

CASTELLORUM OPERATIO, castle-work, or service and labour done by inferior tenants for the building and upholding of castles of defence; toward which some gave personal assistance, and others paid their contributions. This was one of the three necessary charges to which all lands among the Anglo-Saxons were expressly subject.

CASTELVETRO (Lewis), a native of Modena, of the 16th century, famous for his *Comment on Aristotle's Poetics*. He was prosecuted by the inquisition for a certain book of Melancthon, which he had translated into Italian. He retired to Basil, where he died.

CASTIGATION, among the Romans, the punishment of an offender by blows, or beating with a wand or switch. Castigation was chiefly a military punishment; the power of inflicting which on the soldiery was given to the tribunes. Some make it of two kinds; one with a stick or cane called *fustigatio*; the other with rods, called *flagellatio*: the latter was the most dishonourable.

CASTIGATORY for SCOLDS. A woman indicted for being a common scold, if convicted, shall be placed in a certain engine of correction, called the *trebucket*, *castigatory*, or *cucking-stool*; which, in the Saxon language, signifies the *scolding-stool*; though now it is frequently corrupted into the *ducking-stool*; because the residue of the judgment is, that, when she is placed therein, she shall be plunged in water for her punishment.

CASTIGLIONE (Giovanni Benedetto), a celebrated painter, was born at Genoa in 1616. His first master was Gio-Battista Paggi. Afterwards he studied under Andrea Ferrari; and lastly perfected himself from the instructions of Anthony Vandyck, who at that time resided at Genoa. He painted portraits, historical pieces, landscapes, and castles: In the latter of which he is said chiefly to have excelled; as also in fairs, markets, and all kinds of rural scenes. By this master we have also a great number of etchings, which are all spirited, free, and full of taste. The effect is, in general, powerful and pleasing; and many of them have a more harmonized and finished appearance, than is usual from the

Castile-de-
Oro.

CASTILE-de-Oro, a large and fertile country in South America, lying to the west of Oroonoko. It comprehends eight governments; viz. Terra Firma, N^o 66. 4

Castellan

Casting.

The first step to be taken is the forming the mold. In order to this, if the original or model be a bass relief, or any other piece of a flat form, having its surface first well greased, it must be placed on a proper table, and surrounded by a frame, the sides of which must be at such a distance from it as will allow a proper thickness for the sides of the mold. As much plaster as will be sufficient to cover and rise to such a thickness as may give sufficient strength to the mold, as also to fill the hollow betwixt the frame and the model, must be moistened with water, till it be just of such consistence as will allow it to be poured upon the model. This must be done as soon as possible; or the plaster would concrete or set, so as to become more troublesome in the working, or unfit to be used. The whole must then be suffered to remain in this condition, till the plaster has attained its hardness; and then the frame being taken away, the preparatory cast

Casting.

cast or mold thus formed may be taken off from the subject entire.

Where the model or original subject is of a round or erect form, a different method must be pursued; and the mold must be divided into several pieces: or if the subject consists of detached and projecting parts, it is frequently most expedient to cast such parts separately, and afterwards join them together.

Where the original subject or mold forms a round, or spheroid, or any part of such round or spheroid, more than one half the plaster must be used without any frame to keep it round the model; and must be tempered with water to such a consistence, that it may be wrought with the hand like very soft paste; but though it must not be so fluid as when prepared for flat figured models, it must yet be as moist as is compatible with its cohering sufficiently to hold together: and being thus prepared, it must be put upon the model, and compressed with the hand, or any flat instrument, that the parts of it may adapt themselves, in the most perfect manner, to those of the subject, as well as be compact with respect to themselves. When the model is so covered to a convenient thickness, the whole must be left at rest till the plaster be set and firm, so as to bear dividing without falling to pieces, or being liable to be put out of its form by slight violence; and it must then be divided into pieces, in order to its being taken off from the model, by cutting it with a knife with a very thin blade; and being divided, must be cautiously taken off, and kept till dry: but it must be always carefully observed, before the separation of the parts be made, to notch them cross the joints, or lines of the division, at proper distances, that they may with ease and certainty be properly conjoined again; which would be much more precarious and troublesome without such directive marks. The art of properly dividing the molds, in order to make them separate from the model, requires more dexterity and skill than any other thing in the art of casting; and does not admit of rules for the most advantageous conduct of it in every case. Where the subject is of a round or spheroidal form, it is best to divide the mold into three parts, which will then easily come off from the model; and the same will hold good of a cylinder or any regular curve figure.

The mold being thus formed, and dry, and the parts put together, it must be first greased, and placed in such a position that the hollow may lie upwards, and then filled with plaster mixed with water, in the same proportion and manner as was directed for the casting the mold: and when the cast is perfectly set and dry, it must be taken out of the mold, and repaired where it is necessary; which finishes the operation.

This is all that is required with respect to subjects where the surfaces have the regularity above mentioned: but where they form curves which intersect each other, the conduct of the operation must be varied with respect to the manner of taking the cast of the mold from off the subject or model; and where there are long projecting parts, such as legs or arms, they should be wrought in separate casts. The operator may easily judge from the original subjects, what parts will come off together, and what require to be separated: the principle of the whole consists only in this,

VOL. IV. PART I.

that where under-workings, as they are called, occur, that is, wherever a straight line drawn from the basis or insertion of any projection, would be cut or crossed by any part of such projection, such part cannot be taken off without a division; which must be made either in the place where the projection would cross the straight line; or, as that is frequently difficult, the whole projection must be separated from the main body, and divided also lengthwise into two parts: and where there are no projections from the principal surfaces, but the body is so formed as to render the surface a composition of such curves, that a straight line being drawn parallel to the surface of one part would be cut by the outline, in one or more places, of another part, a division of the whole should be made, so as to reduce the parts of it into regular curves, which must then be treated as such.

In larger masses, where there would otherwise be a great thickness of the plaster, a corps or body may be put within the mold, in order to produce a hollow in the cast; which both saves the expence of the plaster, and renders the cast lighter.

This corps may be of wood, where the forming a hollow of a straight figure, or a conical one with the basis outward, will answer the end: but if the cavity require to be round, or of any curve figure, the corps cannot be then drawn while entire; and consequently should be of such matter as may be taken out piecemeal. In this case, the corps is best formed of clay; which must be worked upon wires to give it tenacity, and suspended in the hollow of the mold, by cross wires lying over the mouth; and when the plaster is sufficiently set to bear handling, the clay must be picked out by a proper instrument.

Where it is desired to render the plaster harder, the water with which it is tempered should be mixed with parchment size properly prepared, which will make it very firm and tenacious.

In the same manner, figures, busts, &c. may be cast of lead, or any other metal, in the molds of plaster: only the expence of plaster, and the tediousness of its becoming sufficiently dry, when in a very large mass, to bear the heat of melted metal, render the use of clay, compounded with some other proper materials, preferable where large subjects are in question. The clay, in this case, should be washed over till it be perfectly free from gravel or stones; and then mixed with a third or more of fine sand to prevent its cracking; or, instead of sand, coal-ashes sifted fine may be used. Whether plaster or clay be employed for the casting in metal, it is extremely necessary to have the mold perfectly dry; otherwise the moisture, being rarified, will make an explosion that will blow the metal out of the mold, and endanger the operator, or at least crack the mold in such a manner as to frustrate the operation. Where the parts of a mold are larger, or project much, and consequently require a greater tenacity of the matter they are formed of to keep them together, flocks of cloth, prepared like those designed for paper-hangings, or fine cotton plucked or cut till it is very short, should be mixed with the ashes or sand before they are added to the clay to make the composition for the mold. The proportion should be according to the degree of cohesion required: but a small quantity will answer the end, if the other ingredients

G g

of

Casting.

Castings. of the composition be good, and the parts of the mold properly linked together by means of the wires above directed.

There is a method of taking casts in metals from small animals, and the parts of vegetables, which may be practised for some purposes with advantage: particularly for the decorating grottoes or rock-work, where nature is imitated. The proper kinds of animals are lizards, snakes, frogs, birds, or insects; the casts of which, if properly coloured, will be exact representations of the originals.

This is to be performed by the following method. A coffin or proper chest for forming the mold being prepared of clay, or four pieces of boards fixed together, the animal or parts of vegetables must be suspended in it by a string; and the leaves, tendrils, or other detached parts of the vegetables, or the legs, wings, &c. of the animals, properly separated and adjusted in their right position by a small pair of pincers: a due quantity of plaster of Paris and calcined talc, in equal quantities, with some alumen plumosum, must then be tempered with water to the proper consistence for casting; and the subject from whence the cast is to be taken, as also the sides of the coffin, moistened with spirit of wine. The coffin or chest must then be filled with the tempered composition of the plaster and talc, putting at the same time a piece of straight stick or wood to the principal part of the body of the subject, and pieces of thick wire to the extremities of the other parts, in order that they may form, when drawn out after the matter of the mold is properly set and firm, a channel for pouring in the melted metal, and vents for the air; which otherwise, by the rarefaction it would undergo from the heat of the metal, would blow it out or burst the mold. In a short time the plaster and talc will set and become hard, when the stick and wires may be drawn out, and the frame or coffin in which the mold was cast taken away: and the mold must then be put first into a moderate heat, and afterwards, when it is as dry as can be rendered by that degree, removed into a greater; which may be gradually increased till the whole be red-hot. The animal, or part of any vegetable, which was included in the mold, will then be burnt to a coal; and may be totally calcined to ashes, by blowing for some time gently into the channel and passages made for pouring in the metal, and giving vent to the air, which will, at the same time that it destroys the remainder of the animal or vegetable matter, blow out the ashes. The mold must then be suffered to cool gently; and will be perfect; the destruction of the substance of the animal or vegetable having produced a hollow of a figure correspondent to it: but it may be nevertheless proper to shake the mold, and turn it upside down, as also to blow with the bellows into each of the air-vents, in order to free it wholly from any remainder of the ashes; or, where there may be an opportunity of filling the hollow with quicksilver without expence, it will be found a very effectual method of clearing the cavity, as all dust, ashes, or small detached bodies will necessarily rise to the surface of the quicksilver, and be poured out with it. The mold being thus prepared, it must be heated very hot when used, if the cast be made with copper or brass: but a less degree will serve for lead or tin: and the matter being poured in, the mold

must be gently struck: and then suffered to rest till it be cold: at which time it must be carefully taken from the cast, but without the least force; for such parts of the matter as appear to adhere more strongly, must be softened by soaking in water, till they be entirely loosened, that none of the more delicate parts of the cast may be broken off or bent.

Where the alumen plumosum, or talc, cannot easily be procured, the plaster may be used alone; but it is apt to be calcined by the heat used in burning the animal or vegetable from whence the cast is taken, and to become of too incohering and crumbly a texture: or, for cheapness, Sturbridge or any other good clay, washed over till it be perfectly fine, and mixed with an equal part of sand, and some flocks cut small, may be employed. Pounded pumice-stone and plaster of Paris, taken in equal quantities, and mixed with washed clay in the same proportion, is said to make excellent molds for this and parallel uses.

Casts of metals, or such small pieces as are of a similar form, may be made in plaster by the method directed for bass relievos.

Indeed there is nothing more required than to form a mold by laying them on a proper board; and having surrounded them by a rim made of a piece of a card, or any other pasteboard, to fill the rim with soft tempered plaster of Paris; which mold, when dry, will serve for several casts. It is nevertheless a better method to form the mold of melted sulphur; which will produce a sharper impression in the cast, and be more durable than those made of plaster.

The casts are likewise frequently made of sulphur, which being melted must be treated exactly in the same manner as the plaster.

For taking casts from medals, Dr Lewis recommends a mixture of flowers of brimstone and red lead: equal parts of these are to be put over the fire in a laddle, till they soften to the consistence of pap; then they are kindled with a piece of paper, and stirred for some time. The vessel being afterwards covered close, and continued on the fire, the mixture grows fluid in a few minutes. It is then to be poured on the metal, previously oiled and wiped clean. The casts are very neat; their colour sometimes a pretty deep black, sometimes a dark grey: they are very durable; and when soiled, may be washed clean in spirits of wine. *Philosoph. Commerce of Arts.*

Dr Letsom recommends tin-foil for taking off casts from medals. The thinnest kind is to be used. It should be laid over the subject from which the impression is to be taken, and then rubbed with a brush, the point of a skewer, or a pin, till it has perfectly received the impression. The tin-foil should now be pared close to the edge of the medal, till it is brought to the same circumference: the medal must then be reversed, and the tin-foil will drop off into a chip-box or mold placed ready to receive it. Thus the concave side of the foil will be uppermost, and upon this plaster of Paris, prepared in the usual manner, may be poured. When dry, the whole is to be taken out, and the tin-foil sticking on the plaster will give a perfect representation of the medal, almost equal in beauty to silver. If the box or mold is a little larger than the medal, the plaster running round the tin-foil will give the appearance of a white frame or circular border; *Naturalists Companions.*

Castling. border; whence the new made medal will appear more neat and beautiful.

Castings may be made likewise with iron, prepared in the following manner: "Take any iron-bar, or piece of a similar form; and having heated it red-hot, hold it over a vessel containing water, and touch it very slightly with a roll of sulphur, which will immediately dissolve it, and make it fall in drops into the water. As much iron as may be wanted being thus dissolved, pour the water out of the vessel; and pick out the drops formed by the melted iron from those of the sulphur, which contain little or no iron, and will be distinguishable from the other by their colour and weight." The iron will, by this means, be rendered so fusible, that it will run with less heat than is required to melt lead; and may be employed for making castings of medals, and many other such purposes, with great convenience and advantage.

Impressions of medals, having the same effect as castings, may be made also of isinglass glue, by the following means. Melt the isinglass, beaten, as when commonly used, in an earthen pipkin, with the addition of as much water as will cover it, stirring it gently till the whole is dissolved: then with a brush of camel's hair, cover the medal, which should be previously well cleansed and warmed, and then laid horizontally on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened; and then, with a pin, raise the edge of it; and separate it carefully from the medal: the cast will be thus formed by the glue as hard as horn; and so light, that a thousand will scarcely weigh an ounce. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted isinglass; or the medal may be previously coated with leaf-gold by breathing on it, and then laying it on the leaf, which will by that means adhere to it: but the use of leaf-gold is apt to impair a little the sharpness of the impression.

Impressions of medals may be likewise taken in putty; but it should be the true kind made of calx of tin, and drying oil. These may be formed in the molds, previously taken in plaster or sulphur; or molds may be made in its own substance, in the manner directed for those of the plaster. These impressions will be very sharp and hard; but the greatest disadvantage that attends them, is their drying very slowly, and being liable in the mean time to be damaged.

Impressions of prints, or other engravings, may be taken from copper-plates, by cleansing them thoroughly, and pouring plaster upon them: but the effect in this way is not strong enough for the eye; and therefore the following method is preferable, where such impressions on plaster are desired.

Take vermilion, or any other coloured pigment, finely powdered, and rub it over the plate: then pass a folded piece of paper, or the flat part of the hand, over the plate, to take off the colour from the lights or parts where there is no engraving: the proceeding must then be the same as where no colour is used. This last method is also applicable to the making of impressions of copper-plates on paper with dry colours: for the

plate being prepared as here directed, and laid on the paper properly moistened, and either passed under the rolling-press, or any other way strongly forced down on the paper, an impression of the engraving will be obtained.

Impressions may be likewise taken from copper-plates, either on plaster or paper, by means of the smoke of a candle or lamp: if, instead of rubbing them with any colour, the plate be held over the candle or lamp till the whole surface become black, and then wiped off by the flat of the hand, or paper.

These methods are not, however, of great use in the case of copper-plates, except where impressions may be desired on occasions where printing-ink cannot be procured: but as they may be applied likewise to the taking impressions from snuff-boxes, or other engraved subjects, by which means designs may be instantly borrowed by artists or curious persons, they may in such instances be very useful.

The expedient of taking impressions by the smoke of a candle or lamp may be employed also for botanical purposes in the case of leaves, as a perfect and durable representation of not only the general figure, but the contexture and disposition of the larger fibres, may be extemporaneously obtained at any time. The same may be nevertheless done in a more perfect manner, by the use of linseed oil, either alone, or mixed with a small proportion of colour, where the oil can be conveniently procured: but the other method is valuable on account of its being practicable at almost all seasons, and in all places, within the time that the leaves will keep fresh and plump. In taking these impressions, it is proper to bruise the leaves, so as to take off the projections of the large ribs, which might prevent the other parts from plying to the paper.

Leaves, as also the petals, or flower-leaves, of plants, may themselves be preserved on paper, with their original appearance, for a considerable length of time, by the following means.—Take a piece of paper, and rub it over with isinglass glue treated as above directed for taking impressions from medals; and then lay the leaves in a proper position on the paper. The glue laid on the paper being set, brush over the leaves with more of the same; and that being dry likewise, the operation will be finished, and the leaves so secured from the air and moisture, that they will retain their figure and colour much longer than by any other treatment.

Butterflies, or other small animals of a flat figure, may also be preserved in the same manner.

CASTING is also sometimes used for the quitting, laying, or throwing aside any thing; thus deer cast their horns, snakes their skins, lobsters their shells, hawks their feathers, &c. annually.

Castling of feathers is more properly called *moulting* or *meowing*.

A horse *casts* his hair, or coat, at least once a-year, viz. in the spring when he casts his winter coat; and sometimes, at the close of autumn, he casts his summer coat, in case he has been ill kept. Horses also sometimes *cast* their hoofs, which happens frequently to coach-horses brought from Holland: these, being bred in a moist marshy country, have their hoofs too flabby: so that coming into a drier soil, and less juicy proven-

CASTING,
Castle.

der, their hoofs fall off, and others that are firmer succeed.

CASTING a Colt, denotes a mare's proving abortive.

CASTING-Net, a sort of fishing-net so called, because it is to be *cast*, or thrown out; which when exactly done, nothing escapes it, but weeds and every thing within its extent are brought away.

CASTLE, a fortress, or place rendered defensible either by nature or art. It frequently signifies with us the principal mansion of noblemen. In the time of Henry II. there were no less than 1115 castles in England, each of which contained a manor.

CASTLES, walled with stone, and designed for residence as well as defence, are, for the most part, according to Mr Grose, of no higher antiquity than the conquest: for although the Saxons, Romans, and even, according to some writers on antiquity, the ancient Britons, had castles built with stone; yet these were both few in number, and, at that period, through neglect or invasions, either destroyed, or so much decayed, that little more than their ruins were remaining. This is asserted by many of our historians and antiquaries, and assigned as a reason for the facility with which William made himself master of this country.

This circumstance was not overlooked by so good a general as the Conqueror; who, effectually to guard against invasions from without, as well as to awe his newly acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the resentment of those so despoiled, built strong-holds and castles on their estates. This likewise caused a considerable increase of these fortresses; and the turbulent and unsettled state of the kingdom in the succeeding reigns, served to multiply them prodigiously, every baron or leader of a party building castles; insomuch, that towards the latter end of the reign of king Stephen, they amounted to the almost incredible number of 1115.

As the feudal system gathered strength, these castles became the heads of baronies. Each castle was a manor: and its castelain, owner, or governor, the lord of that manor. Markets and fairs were directed to be held there; not only to prevent frauds in the king's duties or customs, but also as they were esteemed places where the laws of the land were observed, and as such had a very particular privilege. But this good order did not long last: for the lords of castles began to arrogate to themselves a royal power, not only within their castles, but likewise its environs; exercising judicature both civil and criminal, coining of money, and arbitrarily seizing forage and provision for the subsistence of their garrisons, which they afterwards demanded as a right: at length their insolence and oppression grew to such a pitch, that, according to William of Newbury, "there were in England as many kings, or rather tyrants, as lords of castles;" and Matthew Paris styles them, very nests of devils and dens of thieves. Castles were not solely in the possession of the crown and the lay barons, but even bishops had these fortresses; though it seems to have been contrary to the canons, from a plea made use of in a general council, in favour

of king Stephen, who had seized upon the strong castles of the bishops of Lincoln and Salisbury. This prohibition (if such existed) was however very little regarded; as in the following reigns many strong places were held, and even defended, by the ecclesiastics: neither was more obedience afterwards paid to a decree made by the Pope at Viterbo, the fifth of the kalends of June 1220, wherein it was ordained, that no person in England should keep in his hands more than two of the king's castles.

The licentious behaviour of the garrisons of these places becoming intolerable, in the treaty between king Stephen and Henry II. when only duke of Normandy, it was agreed, that all the castles built within a certain period should be demolished; in consequence of which many were actually razed, but not the number stipulated.

The few castles in being under the Saxon government, were probably, on occasion of war or invasions, garrisoned by the national militia, and at other times slightly guarded by the domestics of the princes or great personages who resided therein; but after the conquest, when all the estates were converted into baronies held by knight's service, castle-guard coming under that denomination, was among the duties to which particular tenants were liable. From these services the bishops and abbots, who till the time of the Normans had held their lands in frank almoign, or free alms, were, by this new regulation, not exempted; they were not indeed, like the laity, obliged to personal service, it being sufficient that they provided fit and able persons to officiate in their stead. This was however at first stoutly opposed by Anselm archbishop of Canterbury; who being obliged to find some knights to attend king William Rufus in his wars in Wales, complained of it as an innovation and infringement of the rights and immunities of the church.

It was no uncommon thing for the Conqueror and the kings of those days, to grant estates to men of approved fidelity and valour, on condition that they should perform castle-guard in the royal castles, with a certain number of men, for some specified time; and sometimes they were likewise bound by their tenures to keep in repair and guard some particular tower or bulwark, as was the case at Dover castle.

In process of time these services were commuted for annual rents, sometimes styled *ward-penny*, and wayt-fee, but commonly *castle-guard* rents, payable on fixed days, under prodigious penalties called *surfizes*. At Rochester, if a man failed in the payment of his rent of castle-guard on the feast of St Andrew, his debt was doubled every tide during the time for which the payment was delayed. These were afterwards restrained by an act of parliament made in the reign of king Henry VIII. and finally annihilated, with the tenures by knight's service, in the time of Charles II. Such castles as were private property were guarded either by mercenary soldiers, or the tenants of the lord or owner.

Castles which belonged to the crown, or fell to it either by forfeiture or escheat (circumstances that frequently happened in the distracted reigns of the feudal times), were generally committed to the custody of some trusty person, who seems to have been indifferently styled governor and constable. Sometimes also they were put into the possession of the sheriff of the county, who often

often converted them into prisons. That officer was then accountable at the exchequer, for the farm or produce of the lands belonging to the places entrusted to his care, as well as all other profits: he was likewise, in case of war or invasion, obliged to victual and furnish them with munition out of the issues of his county; to which he was directed by writ of privy seal.

The materials of which castles were built, varied according to the places of their erection; but the manner of their construction seems to have been pretty uniform. The outsides of the walls were generally built with the stones nearest at hand, laid as regularly as their shapes would admit; the insides were filled up with the like materials, mixed with a great quantity of fluid mortar, which was called by the workmen grout-work.

The general shape or plan of these castles depended entirely on the caprice of the architects, or the form of the ground intended to be occupied: neither do they seem to have confined themselves to any particular figure in their towers; square, round, and polygonal, oftentimes occurring in the original parts of the same building.

The situation of the castles of the Anglo-Norman kings and barons, was most commonly on an eminence, and near a river; a situation on several accounts eligible. The whole site of the castle (which was frequently of great extent and irregular figure) was surrounded by a deep and broad ditch, sometimes filled with water, and sometimes dry, called the *fosse*. Before the great gate was an outwork, called a *barbacan*, or *antemural*, which was a strong and high wall, with turrets upon it, designed for the defence of the gate and draw-bridge. On the inside of the ditch stood the wall of the castle, about eight or ten feet thick, and between 20 and 30 feet high, with a parapet, and a kind of embrasures, called *crennels*, on the top. On this wall at proper distances square towers of two or three stories high were built, which served for lodging some of the principal officers of the proprietor of the castle, and for other purposes; and on the inside were erected lodgings for the common servants or retainers, granaries, storehouses, and other necessary offices. On the top of this wall, and on the flat roofs of these buildings, stood the defenders of the castle, when it was besieged, and from thence discharged arrows, darts, and stones, on the besiegers. The great gate of the castle stood in the course of this wall, and was strongly fortified with a tower on each side, and rooms over the passage, which was closed with thick folding-doors of oak, often plated with iron, and with an iron portcullis or grate let down from above. Within this outward wall was a large open space or court, called, in the largest and most perfect castles, the *outer bayle*, or *ballium*, in which stood commonly a church or chapel. On the inside of this outer bayle was another ditch, wall, gate, and towers, inclosing the inner bayle or court, within which the chief tower or *keep* was built. This was a very large square fabric, four or five stories high, having small windows in prodigious thick walls, which rendered the apartments within it dark and gloomy. This great tower was the palace of the prince, prelate, or baron, to whom the castle belonged, and the residence of the constable or governor. Under ground

were dismal dark vaults, for the confinement of prisoners, which made it sometimes be called the *dungeon*. In this building also was the great hall, in which the owner displayed his hospitality, by entertaining his numerous friends and followers. At one end of the great halls of castles, palaces, and monasteries, there was a place raised a little above the rest of the floor, called the *deis*, where the chief table stood, at which persons of the highest rank dined. Though there was unquestionably great variations in the structure of castles, yet the most perfect and magnificent of them seem to have been constructed nearly on the above plan. Such, to give one example, was the famous castle of Bedford, as appears from the following account of the manner in which it was taken by Henry III. A. D. 1224. The castle was taken by four assaults. "In the first was taken the barbican; in the second the outer ballia; at the third attack, the wall by the old tower was thrown down by the miners, where, with great danger, they possessed themselves of the inner ballia, through a chink; at the fourth assault the miners set fire to the tower, so that the smoke burst out, and the tower itself was cloven to that degree, as to show visibly some broad chinks: whereupon the enemy surrendered." See a representation of a castle in Plate CXXVII. where 1 is the barbican, 2 the ditch or moat, 3 the wall of the outer ballium, 4 the outer ballium, 5 the artificial mount, 6 the wall of the inner ballium, 7 the inner ballium, 8 the keep or dungeon.

Before the accession of James VI. to the throne of England, the situation of Scotland was such, that every baron's house was more or less fortified, according to the power and consequence of its lord, or according to the situation of the castle. Near Edinburgh or Stirling, where the inhabitants were more polished in their manners, and overawed by the seat of government, no more was necessary than towers capable of resisting the cursory attack of robbers and thieves, who never durst stop to make a regular investment, but plundered by surprise, and, if repulsed, instantly fled away. Such was Melville Castle. It anciently consisted of a strong built tower of three stories, embattled at the top, and was sufficiently strong to resist a sudden attack, unaided by artillery, or other engines of war. But, when further removed, as in Perthshire, Invernesshire, or Aberdeenshire, then it was necessary to be better defended, and the aids of a peel or dungeon, with outer walls, moat, and wet ditch, barnakin, &c. added to enable the powerful lord to resist the formidable attack of his powerful adversary. The history of Scotland, so late as the reign of the Stuart family, affords a number of melancholy instances of inveterate feuds among the greater and lesser barons of that period; by which every mode of fortification then in use was seldom adequate to the defence of the castle against the storm or blockade of the enraged chieftain. The castle of Doun seems to answer this description of fortification, and has made several gallant defences, in the annals of Scotland. The third kind of fortresses we meet with in Scotland are those situated on the borders of England, or on the sea-coasts of the kingdom, and in the western isles, and very remote places. Many of the old castles in Scotland were situated on an island, in a deep lake, or on a peninsula, which by a broad deep cut was made an island. Of this kind was Lochmaben, in the

stewartry

Castle.

stewartry of Annandale, the castle of Closeburn in the shire of Nithsdale, the castle of the Rive, situated on the river Dee, in the shire of Galloway, Lochleven castle, and many others.

This kind of fortress was only accessible in a hard frost, or by boats which were not easily transported, by a people destitute of good roads and wheel-carriages. In fact, they could only be taken by surprise or blockade; the first very difficult, the second very tedious; so that, before the use of artillery, they might be deemed almost impregnable. On that account, their situation was very desirable in the inland parts of Scotland.

On the sea-coasts of Scotland we generally find the strongest and most ancient, as well as the most impregnable castles. These had to defend themselves from the invasion of the foreign enemy, as well as the attacks of the domestic foe. Thus we find the barons, whose lands extended to the sea-coast, perched, like the eagle, on the most inaccessible rocks that lay within their possessions. Of this kind were Slains castle, Tantallon, and Dunottar on the east coast, and Dunvegan in the isle of Sky, with Dunolly on the west coast. These must have been most uncomfortable retreats, except to a barbarous people, or when a pressing danger forced the baron to seek his safety in the only possible retreat left him.

CASTLE, in ancient writers, denotes a town or village surrounded with a ditch and wall, furnished with towers at intervals, and guarded by a body of troops. The word is originally Latin, *castellum*, a diminutive from *castrum*. *Castellum* originally seems to have signified a smaller fort for a little garrison: though Suetonius uses the word where the fortification was large enough to contain a cohort. The *castella*, according to Vegetius, were often like towns, built on the borders of the empire, and where there were constant guards and fences against the enemy. Horsley takes them for much the same with what were otherwise denominated *stations*.

CASTLE, or *Castle-stead*, is also an appellation given by the country-people in the north to the Roman *castella*, as distinguished from the *castra stativa* which they usually call *chefters*. Horsley represents this as an useful criterion, whereby to discover or distinguish a Roman camp or station. There are several of these castella on Severus's wall: they are generally 60 feet square; their north side is formed by the wall itself which falls in with them; the intervals between them are from six furlongs and an half to seven; they seem to have stood closest where the stations are widest. The neighbouring people call them *castles* or *castle-steads*, by which it seems probable that their ancient Latin name had been *castellum*. Some modern writers call them *mile-castles*, or military *castelle*: Horsley sometimes *exploratory castles*. In these *castella* the *areae* had their stations, who were an order of men whose business was to make incursions into the enemies country, and give intelligence of their motions.

CASTLE, in the sea language, is a part of the ship, of which there are two: the fore-castle, being the elevation at the prow, or the uppermost deck towards the mizen, the place where the kitchens are. Hind-castle is the elevation which reigns on the stern, over the last deck, where the officers cabins and places of assembly are.

CASTLE (Edmund). See CASTEL.

CASTLE-Bar, a borough and market-town, capital of the county of Mayo in Ireland, is a well-inhabited place, and carries on a brisk trade: it has a barrack for a troop of horse; and there is here a charter-school capable of receiving fifty children, and endowed with two acres of land, rent-free, by the Right Honourable Lord Lucan, who has also granted a lease of twenty acres more at a pepper-corn yearly.

CASTLE-Cary, a remarkable Roman station about four miles west from Falkirk on the borders of Stirlingshire in Scotland. It comprehends several acres of ground, is of a square form, and is surrounded with a wall of stone and mortar: all the space within the walls has been occupied by buildings, the ruins of which have raised the earth eight or ten feet above its natural surface; so that the fort now seems like an hill-top surrounded with a sunk fence. In 1770, some workmen employed in searching for stones for the great canal which passes very near it, discovered several apartments of stone; and in one of them a great number of stones about two feet in length, and standing erect, with marks of fire upon them, as if they had been employed in supporting some vessel under which fire was put. In a hollow of the rock near this place, in 1771, a considerable quantity of wheat quite black with age was found, with some wedges and hammers supposed to be Roman.

CASTLE-Rising, a borough-town of Norfolk in England, which sends two members to parliament. E. Long. 0. 40. N. Lat. 52. 46.

CASTLE-work, service or labour done by inferior tenants, for the building and upholding castles of defence, toward which some gave their personal assistance, and others paid their contributions. This was one of the three necessary charges to which the Anglo-Saxons were expressly subject.

CASTLETOWN, the capital of the isle of Man, seated on the south-west part of the island. It has a strong castle; but of no great importance, on account of its distance from the rocky and shallow harbour. W. Long. 4. 39. N. Lat. 53. 30.

CASTOR, the BEAVER, in zoology, a genus of quadrupeds belonging to the order of glires. The fore-teeth of the upper jaw are truncated, and hollowed in a transverse angular direction. The tops of the fore-teeth of the lower jaw lie in a transverse direction; and the tail is depressed. There are three species of castor, viz.

1. The fiber, or common beaver, with a plain ovated tail, is found on the banks of the rivers in Europe, Asia, and America. It has short ears hid in the fur; a blunt nose; the fore-feet small, the hinder large: its length from nose to tail about three feet, tail about one foot. It is from the inguinal glands of this animal that the castor is obtained; it is contained in cuds or pouches resembling a dog's testicles. Nothing equals the art with which these animals construct their dwellings. They choose a level piece of ground, with a small rivulet running through it. This they form into a pond, by making a dam across; first by driving into the ground stakes of five or six feet in length, placed in rows, wattling each row with pliant twigs, and filling the interstices with clay, ramming it down close. The side next the water is sloped, the other perpendicular;

Castle

||

Castor.

CXXXI.

Castor. cular; the bottom is from ten to twelve feet thick; but the thickness gradually diminishes to the top, which is about two or three: the length of these dams is sometimes not less than 100 feet.

Their houses are made in the water collected by means of the dam, and are placed near the edge of the shore. They are built on piles; are either round or oval; but their tops are vaulted, so that their inside resembles an oven, the top a dome. The walls are two feet thick, made of earth, stones, and sticks, most artificially laid together; and the walls within as neatly plastered as if with a trowl. In each house are two openings, the one into the water, the other towards the land. The height of these houses above the water is eight feet. They often make two or three stories in each dwelling, for the convenience of change in case of floods. Each house contains from 20 to 30 beavers; and the number of houses in each pond is from 10 to 25. Each beaver forms its bed of moss; and each family forms its magazine of winter provisions, which consist of bark and boughs of trees. Those they lodge under water, and fetch into their apartments as occasion requires. Lawson says, they are fond of the sassafras, ash, and sweet gum. Their summer food is leaves, fruits, and sometimes crabs and craw fish; but they are not fond of fish.

To effect these works, a community of two or three hundred assembles; each bears his share in the labour; some fall to gnawing with their teeth trees of great size, to form beams or piles; others roll the pieces along to the water; others dive, and with their feet scrape holes in order to place them in; while others exert their efforts to rear them in their proper places: another party is employed in collecting twigs to wattle the piles with; a third in collecting earth, stones, and clay; a fourth is busied in beating and tempering the mortar; others in carrying it on their broad tails to proper places, and with the same instrument ram it between the piles, or plaster the inside of their houses. A certain number of smart strokes given with their tails, is a signal made by the overseer for repairing to such and such places, either for mending any defects, or at the approach of an enemy; and the whole society attend to it with the utmost assiduity. Their time of building is early in summer; for in winter they never stir but to their magazines of provisions, and during that season are very fat. They breed once a-year, and bring forth at the latter end of the winter two or three young at a birth.

Besides these associated beavers, is another sort called *terriers*, which either want industry or sagacity to form houses like the others. They burrow in the banks of rivers, making their holes beneath the freezing depth of the water, and work up for a great number of feet. These also form their winter stock of provision.

Beavers vary in their colours; the finest are black, but the general colour is a chestnut brown, more or less dark: some have been found, but very rarely, white. The skins are a prodigious article of trade, being the foundation of the hat-manufactory. In 1763 were sold, in a single sale of the Hudson's bay company, 54,670 skins. They are distinguished by different names. *Coat-beaver* is what has been worn as coverlets by the Indians: *Parchment-beaver*, because

the lower side resembles it: *Stage-beaver* is the worst, and is that which the Indians kill out of season, on their stages or journeys.

In hunting the beavers, the savages sometimes shoot them, always getting on the contrary side of the wind; for they are very shy, quick in hearing, and of a keen scent. This is generally done when the beavers are at work, or on shore feeding on poplar bark. If they hear any noise when at work, they immediately jump into the water, and continue there some time; and when they rise, it is at a distance from the place where they went in.

They sometimes are taken with traps: these are nothing but poplar sticks laid in a path near the water; which when the beaver begins to feed upon, they cause a large log of wood to fall upon their necks, which is put in motion by their moving of the sticks, and consequently requires an ingenious contrivance. The savages generally prefer this way of taking them, because it does not damage their skins.

In the winter-time they break the ice in two places at a distance from the house, the one behind the other. Then they take away the broken ice with a kind of racket, the better to see where to place their stakes. They fasten their nets to these, which have large meshes, and sometimes are eighteen or twenty yards in length. When these are fixed, they proceed to demolish the house, and turn a dog therein; which terrifying the beaver, he immediately leaves it, and takes to the water; after which, he is soon entangled by the net.

2. The *moschatus*, with a long, compressed, lanceolated tail; and palmated feet. It has a long slender nose like that of a shrew-mouse; no external ears, and very small eyes. Length from nose to tail, seven inches; of the tail, eight. It is the water-rat of Clusius; and inhabits Lapland, Russia, the banks of the rivers Wolga and the Yaick. It never wanders far from the sides; is very slow in its pace; makes holes in the cliffs, with the entrance far beneath the lowest fall of the water; works upwards, but never to the surface, only high enough to be beyond the highest flow of the river: feeds on fish; is devoured by the pikes and *siluri*, and gives those fish so strong a flavour of musk as to render them not eatable; has the same scent as the former, especially about the tail, out of which is expressed a sort of musk very much resembling the genuine kind. The skins are put into chests among clothes, to drive away moths. At Orenburgh the skins and tails sell for 15 or 20 copees per hundred. They are so common near Nizney Novogorod, that the peasants bring 500 a-piece to market, where they are sold for one ruble per hundred. The German name for these animals is *biesem-ratze*; the Russian, *wychozhol*.

3. The *zibethicus*, or musk-rat, with a long, compressed, lanceolated tail, and the toes of the feet separated from each other. Length from nose to tail, one foot; of the tail, nine inches. This species inhabits North America, breeds three or four times in a year, and brings from three to six young ones at a time: during summer the male and female consort together: at the approach of winter they unite in families, and retire into small round edifices covered with a dome, formed of herbs and reeds cemented with

Castor.

Castor.

with clay: at the bottom are several pipes through which they pass in search of food; for they do not form magazines like the beavers: during winter their habitations are covered many feet deep with snow and ice; but they creep out and feed on the roots beneath: they quit their old habitations annually, and form new ones: the fur is soft and much esteemed: the whole animal, during summer, has a most exquisite smell of musk, which it loses in winter: perhaps the scent is derived from the *calamus aromaticus*, a favourite food of this animal. Lescarbot says they are very good to eat.

CASTOR, in astronomy, a moiety of the constellation GEMINI; called also APOLLO. Its latitude northwards, for the year 1700, according to Hevelius, was $10^{\circ} 4' 23''$; and its longitude, of Cancer, $16^{\circ} 4' 14''$. It is also called *Rafalgenze*, *Apollo*, *Aphellan*, *Avellar*, and *Anelar*.

Castor and Pollux, in Pagan mythology. Jupiter having an amour with Leda, the wife of Tyndarus king of Sparta, in the form of a swan, she brought forth two eggs, each containing twins. From that impregnated by Jupiter proceeded Pollux and Helena, who were both immortal; from the other Castor and Clytemnestra, who being begot by Tyndarus were both mortal. They were all, however, called by the common name of *Tyndaridae*. These two brothers entered into an inviolable friendship: they went with the other noble youths of Greece in the expedition to Colchis, and, on several occasions, signalized themselves by their courage; but Castor being at length killed, Pollux obtained leave to share his own immortality with him; so that they are said to live and die alternately every day: for, being translated into the skies, they form the constellation of gemini, one of which stars rises as the other sets.

A martial dance, called the *Pyrrhic* or *Castorian* dance, was invented in honour of those deities whom the Cephelenes placed among the *Dii Magni*, and offered to them white lambs. The Romans also paid them particular honours on account of the assistance they are said to have given them in an engagement against the Latins; in which, appearing mounted on white horses, they turned the scale of victory in their favour, for which a temple was erected to them in the forum.

CASTOR and *Pollux*, a fiery meteor, which at sea appears sometimes sticking to a part of the ship, in form of one, two, or even three or four fire-balls: when one is seen alone, it is more properly called *Helena*; two are denominated *Castor* and *Pollux*, and sometimes *Tyndaridæ*. *Castor* and *Pollux* are called by the Spaniards, *San Elmo*; by the French, *St Elme*, *St Nicholas*, *St Clare*, *St Helene*; by the Italians, *Hermo*; by the Dutch, *Vree Vuuren*.

Castor and *Pollux* are commonly judged to portend a cessation of the storm, and a future calm; being rarely seen till the tempest is nigh spent. *Helena* alone portends ill, and witnesses the severest part of the storm yet behind. When the meteor sticks to the masts, yards, &c. they conclude, from the air's not having motion enough to dissipate this flame, that a profound calm is at hand; if it flutter about, it indicates a storm.

N^o 66.

CASTOREUM, in the *Materia Medica*, CASTOR; *Castoreum*, *Castration*. the inguinal glands of the beaver. The ancients had a notion that it was lodged in the testicles; and that the animals, when hard pressed, would bite them off, and leave them to its pursuers, as if conscious of what they wanted to destroy him for. The best sort of castor is what comes from Russia. So much is Russian castor superior to the American, that two guineas per pound is paid for the former, and only 8s. 6d. for the latter. The Russian castor is in large hard round cods, which appear, when cut, full of a brittle, red, liver-coloured substance, interspersed with membranes and fibres exquisitely interwoven. An inferior sort is brought from Dantzic, and is generally fat and moist. The American castor, which is the worst of all, is in longish thin cods. Russia castor has a strong disagreeable smell; and an acrid, bitterish, and nauseous taste. Water extracts the nauseous part, with little of the finer bitter; rectified spirit extracts this last without much of the nauseous; proof-spirit both: water elevates the whole of its flavour in distillation; rectified spirit brings over nothing. Castor is looked upon as one of the capital nervine and antihysterical medicines: some celebrated practitioners, nevertheless, have doubted its virtues; and Newman and Stahl declare it insignificant. Experience, however, has shown that the virtues of castor are considerable, tho' less than they have been generally supposed.

CASTRATION, in surgery, the operation of gelding, *i. e.* of cutting off the testicles, and putting a male animal out of a capacity of generation.

Castration is much in use in Asia, especially among the Turks, who practise it on their slaves, to prevent any commerce with their women. The Turks often make a general amputation.

Castration also obtains in Italy, where it is used with a view to preserve the voice for singing. See EUNUCH.

The Persians, and other eastern nations, have divers methods of making eunuchs, different from those which obtain in Europe: we say, of making eunuchs, for it is not always done among them by cutting, or even collision. *Cicuta* and other poisonous herbs do the same office, as is shewn by *Paulus Aegineta*. Those eunuchised in this manner are called *thlibia*. Besides which there is another sort named *thlasia*, in whom the genitals are left entire, and only the veins which should feed them are cut; by which means the parts do indeed remain, but so lax and weak, as to be of no use.

Castration was for some time the punishment of adultery. By the laws of the Visigoths, sodomites underwent the same punishment.

By the civil law, it is made penal in physicians and surgeons to castrate, even with consent of the party, who is himself included in the same penalty, and his effects forfeited. The offence of Mayhem by castration is, according to all our old writers, felony; tho' committed upon the highest provocation. See a record to this purpose of Henry III. transcribed by Sir Edward Coke, 3 Inst. 62. or Blackstone's Com. vol. iv. p. 206.

Castration is sometimes found necessary on medicinal considerations, as in mortifications, and some other diseases of the testicles, especially the *sarcocoele* and *varicocoele*. Some have also used it in maniac cases.

Castration
Castruccio.

CASTRATION is also in some sort practised on women. Athenæus mentions, that king Andramytes was the first who castrated women. Hesychius and Suidas say Gyges did the same thing. Galen observes, that women cannot be castrated without danger of life: and Dalechampius, on the forementioned passage of Athenæus, holds, that it is only to be understood of simple padlocking.

CASTRATION, in respect of brutes, is called GELDING and SPAYING.

CASTRATION also denotes the art of retrenching, or cutting away any part of a thing from its whole.—Castrating a book, among booksellers, is the taking out some leaf, sheet, or the like, which renders it imperfect and unfit for sale. The term is also applied to the taking away particular passages, on account of their obscenity, too great freedom with respect to government, &c.

CASTRATION, among botanists, a term derived from the fancied analogy betwixt plants and animals. The castration of plants consists in cutting off the *antheræ*, or tops of the stamina, before they have attained maturity, and dispersed the pollen or fine dust contained within their substance. This operation has been frequently practised by the moderns, with a view to establish or confute the doctrine of the sexes of plants; the *antheræ* or tops being considered by the sexualists as the male organs of generation. The experiment of castration succeeds principally on plants which, like the melon, have their male flowers detached from the female. In such as have both male and female flowers contained within the same covers, this operation cannot be easily performed without endangering the neighbouring organs. The result of experiments on this subject by Linnæus, Alston, and other eminent botanists, may be seen under the article BOTANY, sect. iii.

CASTREL, a kind of hawk resembling the lanner in shape, but the hobby in size. The castrel is also called kestrel, and is of a slow and cowardly kind; her game is the grous, though she will kill a partridge.

CASTRES, a city of Languedoc in France, about 35 miles east of Thoulouse. E. Long. 2. and N. Lat. 43. 40. It is a bishop's see.

CASTRO, the capital of the island of Chiloe, on the coast of Chili in South America. W. Long. 82. S. Lat. 43.

CASTRO is also the capital of a duchy of the same name in the Pope's territories in Italy, situated on the confines of Tuscany. E. Long. 12. 35. N. Lat. 42. 30.

CASTRO (Pietro de), a celebrated painter, who flourished about the middle of the 17th century. The subjects which this great artist chose to paint, were what are distinguished by the name of still life; vases, shells, musical instruments, gems, vessels of gold, silver, and crystal, books, and rich bracelets; and in those subjects his choice and disposition were elegant, and his execution admirable.

CASTRUCCIO (Castracani), a celebrated Italian general, was born (nobody knows of whom) at Lucca in Florence in 1284, and left in a vineyard covered with leaves, where he was found by Dianora a widow lady, the sister of Antonio, a canon of St Michael in Lucca, who was descended from the illustrious family of the Castracani. The lady having no children, they resolved to bring him up, and educated him as carefully as he had been their own. They intended him for a priest; but he was scarcely 14 years old when he began to devote himself to military sports, and those violent exercises which suited his great strength of body. The factions named the *Guelfs* and *Gibelines* then shared all Italy between them; divided the popes and the emperors; and engaged in their different interests not only the members of the same town, but even those of the same family. Francisco, a considerable person on the side of the Gibelines, observing Castruccio's uncommon spirit and great qualities, prevailed with Antonio to let him turn soldier; on which Castruccio soon became acquainted with every thing belonging to that profession, and was made a lieutenant of a company of foot by Francisco Guinigi. In his first campaign he gave such proofs of his courage and conduct as spread his fame all over Lombardy; and Guinigi, dying soon after, committed to him the care of his son and the management of his estate. Still distinguishing himself by his exploits, he filled his commander in chief with such jealousy and envy, that he was imprisoned by stratagem in order to be put to death. But the people of Lucca soon released him, and afterwards chose him for their sovereign prince. The Gibelines considered him as the chief of their party; and those who had been banished from their country fled to him for protection, and unanimously promised, that if he could restore them to their estates, they would serve him so effectually that the sovereignty of their country should be his reward. Flattered by these promises, he entered into a league with the prince of Milan. He kept his army constantly on foot, employing it as best suited his own designs. For services he had done the pope, he was made senator of Rome with more than ordinary ceremony; but while there, received news which obliged him to hasten back to Lucca. The Florentines entered into a war with him, but Castruccio fought his way through them; and the supreme authority of Tuscany was ready to fall into his hands, when a period was put to his life. In May 1328, he gained a complete victory over his enemies, who amounted to 30,000 foot and 10,000 horse; in which 22,000 of them were slain, with the loss of not quite 16,000 of his own men: but as he was returning from the field of battle, tired with the action, and covered with sweat, he halted a little, in order to thank and caress his foldiers as they passed; when, the north wind blowing upon him, he was immediately seized with an ague, which he at first neglected, but it carried him off in a few days, in the 44th year of his age.

Machiavel, who has written the life of Castruccio, says, that he was not only an extraordinary man in his own age, but would have been so in any other. He was of a noble aspect, and of the most winning address. He had all the qualities that make a man great; was grateful to his friends, just to his subjects, terrible to his enemies. No man was more forward to encounter dangers; no man more careful to escape them. He had an uncommon presence of mind, and often made rapartees with great smartness. Some of them are recorded, which discover a singular turn of humour; and,

H h

and,

Castruccio
||
Casualty

and, for a specimen, we shall mention three or four of them.—Passing one day through a street where there was a house of bad fame, he surprised a young man, who was just coming out, and who, upon seeing him, was all over blushes and confusion: “Friend, you should not be ashamed when you come out, but when you go in.”—One asking a favour of him with a thousand impertinent and superfluous words: “Hark you, friend; when you would have any thing with me for the future, send another man to ask it.”—Another great talker having tired him with a tedious discourse, excused himself at last, by saying, he was afraid he had been troublesome. “No indeed, (replied he), for I did not mind one word you said.”—He was forced to put a citizen of Lucca to death, who had formerly been a great instrument of his advancement; and being reproached by somebody for having dealt so severely with an old friend, replied, “No, you are mistaken, it was with a new foe.”—One of his courtiers, desirous to regale him, made a ball and invited him to it. Castruccio came, entertained himself among the ladies, danced, and did other things which did not seem to comport with the dignity of his rank. One of his friends intimating that such freedoms might diminish the reverence that ought to be paid him: “I thank you for your caution; but he who is reckoned wise all the day, will never be reckoned a fool at night.”

CASTRUM DOLORIS, in middle-aged writers, denotes a catafalco, or a lofty tomb of state, erected in honour of some person of eminence, usually in the church where his body is interred; and decorated with arms, emblems, lights, and the like.

Ecclesiastical writers speak of a ceremony of consecrating a *castrum doloris*; the edifice was to be made to represent the body of the deceased, and the priest and deacon were to take their posts, and say the prayers after the same manner as if the corpse were actually present.

CASTS. See CASTING.

CASU CONSIMILI, in law, a writ of entry granted where a tenant, by courtesy or for life, aliens either in fee, in tail, or for the term of another's life. It is brought by him in reversion against the person to whom such tenant does so alien to the prejudice of the reversioner in the tenant's life-time.

CASU-PROVISO, in law, a writ of entry founded on the statute of Gloucester, where a tenant in dower aliens the lands she so holds in fee, or for life; and lies for the party in reversion against the alienee.

CASUAL, something that happens fortuitously, without any design, or any measures taken to bring it to pass.

CASUAL-Revenues, are those which arise from forfeitures, confiscations, deaths, attainders, &c.

CASUAL-Theology, a denomination given to what is more frequently called CASUISTRY.

CASUALTY, in a general sense, denotes an accident, or a thing happening by chance, not design. It is particularly used for an accident producing unnatural death.

CASUALTY, in Scot's law. *Casualties of a superior*, are those duties and emoluments which a superior has right to demand out of his vassal's estate, over and besides the constant yearly duties established

by the *reddendo* of his charter upon certain casual events.

CASUALTY, in Metallurgy. See CAUSALTY.

CASUIST, a person who proposes to resolve cases of conscience. Escobar has made a collection of the opinions of all the casuists before him. M. Le Feore, preceptor of Louis XIII. called the books of the casuists the art of quibbling with God; which does not seem far from truth, by reason of the multitude of distinctions and subtleties they abound withal. Mayer has published a bibliotheca of casuists, containing an account of all the writers on cases of conscience, ranged under three heads, the first comprehending the Lutheran, the second the Calvinist, and the third the Romish, casuists.

CASUISTRY, the doctrine and science of conscience and its cases, with the rules and principles of resolving the same; drawn partly from natural reason or equity; partly from authority of scripture, the canon law, councils, fathers, &c. To casuistry belongs the decision of all difficulties arising about what a man may lawfully do or not do; what is sin or not sin; what things a man is obliged to do in order to discharge his duty, and what he may let alone without breach of it.

CASUS AMISSIONIS, in Scots law, in actions proving the tenor of obligations inextinguishable by the debtors retiring or cancelling them, it is necessary for the pursuer, before he is allowed a proof of the tenor, to condescend upon such a *casus amissionis*, or accident by which the writing was destroyed, as shows it was lost while in the writer's possession.

CAT, in zoology. See FELIS.

CAT, in sea-affairs, a ship employed in the coal-trade, formed from the Norwegian model. It is distinguished by a narrow stern, projecting quarters, a deep *waiste*, and by having ornamental figures on the prow. These vessels are generally built remarkably strong, and carry from four to six hundred tons, or, in the language of their own mariners, from 20 to 30 *keels* of coals.

CAT, is also a sort of strong tackle, or combination of pulleys, to hook and draw the anchor perpendicularly up to the *cat-head*. See CAT-HEADS.

CAT'S EYE, or Sun-stone of the Turks, a kind of gem found chiefly in Siberia. Cat's-eye is by the Latins called *occulus cati*, and sometimes *onyxopalus*, as having white zones or rings like the onyx; and its colours variable like OPAL, from which last it differs chiefly by its superior hardness. It is very hard, and semitransparent, and has different points, from whence the light is reflected with a kind of yellowish radiation somewhat similar to the eyes of cats, from whence it had its name. The best of them are very scarce, and jewellers cut them round to the greatest advantage. One of these stones, an inch in diameter, was in the possession of the duke of Tuscany.

CAT-FISH, in ichthyology. See SQUALUS.

CAT-GUT, a denomination given to small strings for fiddles, and other instruments, made of the intestines of sheep or lambs, dried and twisted together, either singly, or several together. These are sometimes coloured red, sometimes blue, but are commonly left whitish or brownish, the natural colour of the gut.

They

Cat-gut.

Cat-harp-
ings
||
Catacomb.

They are also used by watch-makers, cutlers, turners, and other artificers. Great quantities are imported into England, and other northern countries, from Lyons and Italy.

CAT-Harpings, a purchase of ropes employed to brace in the shrouds of the lower masts behind their yards, for the double purpose of making the shrouds more tight, and of affording room to draw in the yards more obliquely, to trim the sails for a side-wind, when they are said to be close hauled.

CAT-Heads, two strong short beams of timber, which project almost horizontally over the ship's bows on each side of the bow-sprit; being like two radii which extend from a centre taken in the direction of the bow-sprit. That part of the cat-head which rests upon the fore-castle, is securely bolted to the beams: the other part projects like a crane as above described, and carries in its extremity two or three small wheels or sheaves of brass or strong wood, about which a rope called the *cat-fall* passes, and communicates with the cat-block, which also contains three sheaves. The machine formed by this combination of pulleys is called the *Cat*, which serves to pull the anchor up to the cat-head, without tearing the ship's sides with its flukes. The cat-head also serves to suspend the anchor clear of the bow, when it is necessary to let it go: it is supported by a sort of knee, which is generally ornamented with sculpture. See Plate CXXVIII.

The cat-block is filled with a large and strong hood, which catches the ring of the anchor when it is to be drawn up.

CAT-Mint, See MENTHA.

CAT-Salt, a name given by our salt-workers to a very beautifully granulated kind of common salt. It is formed out of the bittern, or leach-brine, which runs from the salt when taken out of the pan. When they draw out the common salt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine to drain out; under these troughs are placed vessels to receive this brine, and across them small sticks to which the cat-salt affixes itself in very large and beautiful crystals. This salt contains some portion of the bitter purging salt, is very sharp and pungent, and is white when powdered, though pellucid in the mass. It is used by some for the table, but the greatest part of what is made of it is used by the makers of hard-soap.

CAT-Silver. See MICA.

CATACAUSTIC CURVES, in the higher geometry, that species of caustic curves which are formed by reflection. See FLUXIONS.

CATACHRESIS, in rhetoric, a trope which borrows the name of one thing to express another. Thus Milton, describing Raphael's descent from the empyreal heaven to paradise, says,

"Down thither prone in flight,

"He speeds, and through the vast ethereal sky

"Sails between worlds and worlds."

CATACOMB, a grotto, or subterraneous place for the burial of the dead.

Some derive the word *catacomb* from the place where ships are laid up, which the modern Latins and Greeks call *cumbæ*. Others say, that *cata* was used for *ad*, and *catacumbas* for *adtumbas*: accordingly, Dadin says, they

anciently wrote *catatumbas*. Others fetch the word *Catacombs* from the Greek *κατα*, and *κυμβη*, a hollow, cavity, or the like.

Anciently the word *catacomb* was only understood of the tombs of St Peter and St Paul; and M. Chastelain observes, that, among the more knowing of the people of Rome, the word *catacomb* is never applied to the subterraneous burying-places hereafter mentioned, but only to a chapel in St Sebastian, one of the seven titular churches; where the ancient Roman calendars say the body of St Peter was deposited, under the consulate of Tuscus and Bassus, in 258.

CATACOMBS of Italy; a vast assemblage of subterraneous sepulchres about Rome, chiefly at about three miles from that city in the Via Appia; supposed to be the sepulchres of the martyrs; and which are visited accordingly out of devotion, and relics thence taken and dispersed throughout the catholic countries, after having been first baptized by the pope under the name of some saint. These *catacombs* are said by many to be caves or cells wherein the primitive Christians hid and assembled themselves together, and where they interred such among them as were martyred. Each *catacomb* is three feet broad, and eight or ten high; running in form of an alley or gallery, and communicating with others: in many places they extend within a league of Rome. There is no masonry or vaulting therein, but each supports itself: the two sides, which we may look on as the *parietes* or walls, were the places where the dead were deposited; which were laid lengthwise, three or four rows over one another, in the same *catacomb*, parallel to the alley. They were commonly closed with large thick tiles, and sometimes pieces of marble, cemented in a manner inimitable by the moderns. Sometimes, though very rarely, the name of the deceased is found on the tile: frequently a palm is seen, painted or engraven, or the cipher Xp, which is commonly read *pro Christo*. The opinion held by many Protestant authors is, that the *catacombs* are heathen sepulchres, and the same with the *puticuli* mentioned by Festus Pompeius; maintaining, that whereas it was the practice of the ancient Romans to burn their dead, the custom was, to avoid expence, to throw the bodies of their slaves to rot in holes of the ground; and that the Roman Christians, observing, at length, the great veneration paid to relics, resolved to have a stock of their own: entering therefore the *catacombs*, they added what ciphers and inscriptions they pleased; and then shut them up again, to be opened on a favourable occasion. Those in the secret, add they, dying or removing, the contrivance was forgot, till chance opened them at last. But this opinion has even less of probability than the former. Mr Monro, in the *Philosophical Transactions*, supposes the *catacombs* to have been originally the common sepulchres of the first Romans, and dug in consequence of these two opinions, viz. That shades hate the light; and that they love to hover about the places where the bodies are laid.

Though the *catacombs* of Rome have made the greatest noise of any in the world, there are such belonging to many other cities. Those of Naples, according to bishop Burnet, are much more noble and spacious than the *catacombs* of Rome. *Catacombs*

Catacombs. have also been discovered at Syracuse, and Catanea in Sicily, and in the island of Malta. The Roman catacombs take particular names from the churches in their neighbourhood, and seem to divide the circumference of the city without the walls between them, extending their galleries every where under, and a vast way from it; so that all the ground under Rome, and for many miles about it, some say 20, is hollow. The largest, and those commonly shown to strangers, are the catacombs of San Sebastiano, those of Saint Agnese, and the others in the fields a little off Saint Agnese. Women are only allowed to go into the catacombs in the church-yard of the Vatican on Whitsun-Monday, under pain of excommunication. There are men kept constantly at work in the *catacombs*. As soon as these labourers discover a grave with any of the supposed marks of a saint upon it, intimation is given to the cardinal Comerlingo, who immediately sends men of reputation to the place, where finding the palm, the monogram, the coloured glass, &c. the remains of the body are taken up with great respect, and translated to Rome. After the labourers have examined a gallery, they stop up the entry that leads to it; so that most of them remain thus closed up; only a few being left open to keep up the trade of showing them to strangers. This they say is done to prevent people from losing themselves in these subterraneous labyrinths, which indeed has often happened; but more probably to deprive the public of the means of knowing whither and how far the catacombs are carried.

The method of preserving the dead in catacombs seems to have been common to a number of the ancient nations. The catacombs of Egypt are still extant about nine leagues from the city of Grand Cairo, and two miles from the city of Zaccara. They extend from thence to the pyramids of Pharaoh, which are about eight miles distant. They lie in a field covered with a fine running sand, of a yellowish colour. The country is dry and hilly; the entrance of the tomb is choaked up with sand; there are many open, but more that are still concealed.

The bodies found in catacombs, especially those of Egypt, are called *mummies*; and as their flesh was formerly reckoned an efficacious medicine, they were much sought after. In this work the labourers were often obliged to clear away the sand for weeks together, without finding what they wanted. Upon coming to a little square opening of about 18 feet in depth, they descend into it by holes for the feet, placed at proper intervals; and there they are sure of finding a mummy. These caves, or *wells* as they call them there, are hollowed out of a white free-stone, which is found in all this country a few feet below the covering of sand. When one gets to the bottom of these, which are sometimes 40 feet below the surface, there are several square openings on each side into passages of 10 or 15 feet wide; and these lead to chambers of 15 or 20 feet square. These are all hewn out in the rock; and in each of the catacombs are to be found several of these apartments communicating with one another. They extend a great way under ground, so as to be under the city of Memphis, and in a manner to undermine its environs. In some of the chambers the walls are adorned with figures and hieroglyphics; in others

the mummies are found in tombs, round the apart-Catacombs. ment hollowed out in the rock.

The Egyptians seem to have excelled in the art of embalming and preserving their dead bodies; as the mummies found in the Egyptian catacombs are in a better state than the bodies found either in the Italian catacombs or those of any other part of the world. See EMBALMING and MUMMY.

Laying up the bodies in caves, is certainly the original way of disposing of the dead; and appears to have been propagated by the Phœnicians throughout the countries to which they sent colonies: the interring as we now do in the open air or in temples was first introduced by the Christians. When an ancient hero died or was killed in a foreign expedition, as his body was liable to corruption, and for that reason unfit to be transported entire, they fell on the expedient of burning, in order to bring home the ashes, to oblige the *manes* to follow; that so his country might not be destitute of the benefit of his tutelage. It was thus burning seems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the ancient burying: thus *catacombs* became disused among the Romans, after they had borrowed the manner of burning from the Greeks, and then none but slaves were laid in the ground. See BURIAL, &c.

CATALAUNI, called also *Durocatalauni*, a town of Gallia Belgica: *Catalauni*, the people. A name rather of the lower age than of classical antiquity. Now *Châlons sur Marne*, in Champaign. E. Long. 4. 35. N. Lat. 48. 55.

CATADROMUS (from *κατα* and *δρομος*, *I run*), in antiquity, a stretched sloping rope in the theatres, down which the *funambuli* walked to show their skill.

Some have taken the word to signify the hippodrome or decursorium wherein the Roman knights used to exercise themselves in running and fighting on horseback. But the most natural meaning is that of a rope fastened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the highest glory of the ancient *schœnobates* or *funambuli*. Elephants were also taught to run down the *catadromus*. Suetonius speaks of the exploit of a Roman knight, who passed down the *catadromus* mounted on an elephant's back.

CATAGOGION, a heathen festival at Ephesus, celebrated on the 22d of January, in which the devotees run about the streets, dressed in divers antic and unseemly manners, with huge cudgels in their hands, and carrying with them the images of their gods; in which guise they ravished the women they met with, abused and often killed the men, and committed many other disorders, to which the religion of the day gave a sanction.

CATAGRAPHA, in antiquity, denote oblique figures or views of mens faces; answering to what the moderns call *profiles*.

Catagrapha are said to be the invention of Simon Cleonæus, who first taught painters to vary the looks of their figures, and sometimes direct them upwards, sometimes downwards, and sometimes sideways or backwards.

CATALEPSIS, or CATALEPSY, in medicine, a kind

Catalepsis.

Catalogue. kind of apoplexy or a drowsy disease wherein the patient is taken speechless, senseless, and fixed in the same posture wherein the disease first seized him; his eyes open, without seeing or understanding. See *MEDICINE-Index*.

CATALOGUE, a list or enumeration of the names of several books, men, or other things, disposed according to a certain order.

Catalogues of books are digested in different manners, some according to the order of the times when the books were printed, as that of Mattaire; others according to their form and size, as the common book-sellers-catalogues; others according to the alphabetical order of the authors names, as Hyde's catalogue of the Bodleian library; others according to the alphabetical order of matters or subjects, which are called *real* or *classical catalogues*, as those of Lipenius and Draudius; lastly, others are digested in a mixed method, partaking of several of the former, as de Seine's catalogue of cardinal Slusius's library, which is first divided according to subjects or sciences, and afterwards the books in each are recited alphabetically.

The most applauded of all catalogues is that of Thuanus's library, in which are united the advantages of all the rest. It was first drawn up by the two Puteani in the alphabetical order, then digested according to the sciences and subjects by Ishm. Bullialdus, and published by F. Quesnel at Paris in 1679; and reprinted, though incorrectly, at Hamburg, in 1704. The books are here ranged with justness under their several sciences and subjects, regard being still had to the nation, sect, age, &c. of every writer. Add, that only the best and choicest books in every subject are found here, and the most valuable editions. Yet the catalogue of M. le Telliers archbishop of Rheim's library, made by M. Clement, is not inferior to any published in our age, either on account of the number and choice of the books, or the method of its disposition. One advantage peculiar to this catalogue is, the multitude of anonymous and pseudonymous authors detected in it, scarce to be met with elsewhere. Some even prefer it to Thuanus's catalogue, as containing a greater variety of classes and books on particular subjects.

The conditions required in a catalogue are, that it indicate at the same time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; so as that all these circumstances may appear at once in the shortest, clearest, and exactest manner possible. In this view, all the catalogues yet made will be found to be defective.

An anonymous French writer has laid down a new plan of a catalogue, which shall unite all the advantages, and avoid all the inconveniences of the rest.

The Jesuits of Antwerp has given us a catalogue of the popes; which makes what they call their *Propylaum*.

CATALOGUE of the Stars, is a list of the fixed stars, disposed in their several constellations; with the longitudes, latitudes, &c. of each.

The first who undertook to reduce the fixed stars into a catalogue was Hipparchus Rhodius, about 120 years before Christ; in which he made use of the ob-

servations of Timocharis and Aristyllus for about 180 years before him. Ptolemy retained Hipparchus's catalogue, containing 1026 fixed stars; though he himself made abundance of observations, with a view to a new catalogue, A. D. 140. About the year of Christ 880, Albategni, a Syrian, brought down the same to his time. Anno 1437, Ulugh Beigh, king of Parthia and India, made a new catalogue of 1022 fixed stars, since translated out of Persian into Latin by Dr Hyde. The third who made a catalogue from his own observations was Tycho Brahe, who determined the places of 777 stars for the year 1600, which Kepler from other observations of Tycho afterwards increased to the number of 1000 in the Rudolphine tables; adding those of Ptolemy omitted by Tycho, and of other authors, so that his catalogue amounts to above 1160. At the same time, William landgrave of Hesse, with his mathematicians Christopher Rothmannus and Justus Byrgius, determined the places of 400 fixed stars by his own observations, with their places rectified for the year 1593; which Hevelius prefers to those of Tycho's. Ricciolus, in his *Astronomia Reformata*, determined the places of 101 stars for the year 1700, from his own observations: for the rest he followed Tycho's catalogue; altering it where he thought fit. Anno 1667, Dr Halley, in the island of St Helena, observed 350 southern stars not visible in our horizon. The same labour was repeated by F. Noel in 1710, who published a new catalogue of the same stars constructed for the year 1687.

Bayer, in his *Uranometria*, published a catalogue of 1160 stars, compiled chiefly from Ptolemy and Tycho, in which every star is marked with some letter of the Greek alphabet; the biggest star in any constellation being denoted by the first letter, the next by the second, &c. and if the number exceeds the Greek alphabet, the remaining stars are marked by letters of the Roman alphabet, which letters are preserved by Flamsteed, and by Senex on his globes. The celebrated Hevelius composed a catalogue of 1888 stars, 1553 of which were observed by himself; and their places were computed for the year 1660.

The last and greatest is the Britannic catalogue, compiled from the observations of the accurate Mr Flamsteed; who for a long series of years devoted himself wholly thereto. As there was nothing wanting either in the observer or apparatus, we may look on this as a perfect work so far as it goes. It is to be regretted the impression had not passed through his own hands: that now extant, was published by authority, but without the author's consent: it contains 2734 stars. There was another published in 1725, pursuant to his testament; containing no less than 3000 stars, with their places rectified for the year 1689: to which is added Mr Sharp's catalogue of the southern stars not visible in our hemisphere, adapted to the year 1726.

CATALONIA, a province of Spain, bounded on the north by the Pyrenean mountains, which divide it from France; by the kingdom of Arragon and Valencia on the west; and by the Mediterranean sea on the south and east. It is 155 miles in length, and 100 in breadth. It is watered by a great number of rivers; the principal of which are the Lobregat, the Ter, and the

*Catalogue,
Catalonia.*

Catalonia
||
Catanan-
che.

the Segra. The air is temperate and healthy; but the land is mountainous, except in a few places. It produces, however, corn, wine, oil, pulse, flax, and hemp, sufficient for the inhabitants. The mountains are covered with large forests of tall trees, such as the oak, the ever-green oak, the beech, the pine, the fir, the chestnut, and many others; with cork-trees, shrubs, and medicinal plants. There are several quarries of marble of all colours, crystal, alabaster, amethysts, and lapis lazuli. Gold dust has been found among the sands of one or two of the rivers; and there are mines of tin, iron, lead, alum, vitriol, and salt. They likewise fish for coral on the eastern coast. The inhabitants are hardy, courageous, active, vigorous, and good soldiers, but apt to be discontented. The miquelets are a sort of soldiers which guard the passes over the mountains, and ought to protect travellers; but if they are not paid to their minds, they seldom fail to pay themselves. The river Lobregat divides Catalonia into two parts, the east and west, according to their situation. This province comprehends 17 vigueries or territories; two of which are in Roussillon, and belong to the French. The rest are subject to the Spaniards. The principal towns are Barcelona the capital, Tarragona, Tortosa, Lerida, Solsona, Cardona Vich, Girona, Seu d'Urgel, Pui Cerda, and Cervera. Catalonia was the last province in Spain which submitted to Philip in the succession-war.

CATAMENIA, in medicine. See MENSES.

CATAMITE, a boy kept for sodomitical practices.

CATANA, or CATINA (anc. geog.), a town of Sicily, situated opposite to Ætna, to the south-east; one of the five Roman colonies: anciently built by the people of Naxos seven years after the building of Syracuse, 728 years before Christ. It was the country of Charondas, the famous lawgiver. The town is still called *Catanea*. See CATANEA.

CATANANCHE, CANDIA LIONS-FOOT: A genus of the polygamia æqualis order, belonging to the syngenesia class of plants; and in the natural method ranking under the 49th order, *Compositæ*. The receptacle is paleaceous; the calyx imbricated; the pappus furnished with awns by a caliculus of five stiff hairs. There are three species, of which the cerulea is the most remarkable. This sends out many long, narrow, hairy leaves, which are jagged on their edges like those of the buckhorn plantain, but broader; the jags are deeper, and at greater distances: these lie flat on the ground, turning their points upwards. Between the leaves come out the flower stalks, which are in number proportionable to the size of the plants; for, from an old thriving root, there are frequently eight or ten, while young plants do not send out above two or three. These stalks rise near two feet high, dividing into many small branches upward, garnished with leaves like those below, but smaller, and without jags on their edges; each of these smaller branches are terminated by single heads of flowers, of a fine blue colour. This is a perennial plant, and may be propagated by seeds or slips. The seeds may be sown in the spring on a bed of common earth; and in the autumn following the plants may be removed to the places where they are to remain. The seeds ripen in August. This

plant is a pretty ornament in gardens, and is easily kept within bounds. *Catanea.*

CATANEA, or CATANIA, a city of Sicily, seated on a gulph of the same name, near the foot of Mount Ætna or Gibel. It was founded by the Chalcidians soon after the settlement of Syracuse, and enjoyed great tranquillity till Hiero I. expelled the whole body of citizens; and after replenishing the town with a new stock of inhabitants, gave it the name of Ætna: immediately after his decease, it regained its ancient name, and its citizens returned to their abodes. Catania fell into the hands of the Romans, among their earliest acquisitions in Sicily, and became the residence of a prætor. To make it worthy of such an honour, it was adorned with sumptuous buildings of all kinds, and every convenience was procured to supply the natural and artificial wants of life. It was destroyed by Pompey's son, but restored with superior magnificence by Augustus. The reign of Decius is famous in the history of this city for the martyrdom of its patroness St Agatha. On every emergency her intercession is implored. She is piously believed to have preserved Catania from being overwhelmed by torrents of lava, or shaken to pieces by earthquakes; yet its ancient edifices are covered by repeated streams of volcanic matter; and almost every house, even her own church, has been thrown to the ground. In the reign of William the Good, 20,000 Catanians, with their pastor at their head, were destroyed before the sacred veil could be properly placed to check the flames. In the last century the eruptions and earthquakes raged with redoubled violence, and Catania was twice demolished. See ÆTNA.

The present prince of Biscari has been at infinite pains, and spent a large sum of money, in working down to the ancient town, which on account of the numerous torrents of lava that have flowed out of Mount Ætna for these last thousand years, is now to be sought for in dark caverns many feet below the present surface of the earth. Mr Swinburne informs us that he descended into baths, sepulchres, an amphitheatre, and a theatre, all very much injured by the various catastrophes that have befallen them. They were erected upon old beds of lava, and even built with square pieces of the same substance, which in no instance appears to have been fused by the contact of new lavas: The sciarra or stones of cold lava, have constantly proved as strong a barrier against the flowing torrent of fire as any other stone could have been, though some authors were of opinion that the hot matter would melt the old mass and incorporate with it.

This city has been frequently defended from the burning streams by the solid mass of its own ramparts, and by the air compressed between them and the lava; as appears by the torrent having stopt within a small distance of the walls, and taken another direction. But when the walls were broken or low, the lava collected itself till it rose to a great height, and then poured over in a curve. A similar instance is seen at the Torre del Greco near Naples, where the stream of liquid fire from Vesuvius divided itself into two branches, and left a church untouched in the middle. There is a well at the foot of the old walls of Catania, where the lava, after running along the parapet, and then falling

Catanea falling forwards, has produced a very complete lofty arch over the spring.

Cataphracta.

The church here is a noble fabric. It is accounted the largest in Sicily, though neither a porch nor cupola has been erected, from a doubt of the solidity of the foundations, which are no other than the bed of lava that ran out of *Ætna* in 1669, and is supposed to be full of cavities. The organ is much esteemed by connoisseurs in musical instruments.

Catania, according to Mr Swinburne's account, is reviving with great splendor. "It has already (he says) much more the features of a metropolis and royal residence than Palermo; the principal streets are wide, straight, and well paved with lava. An obelisk of red granite, placed on the back of an antique elephant of touchstone stands in the centre of the great square, which is formed by the town-hall, seminary, and cathedral. The cathedral erected by the abbot Angerius in the year 1094, was endowed by earl Roger with the territories of Catania and *Ætna*, for the small acknowledgment of a glass of wine and a loaf of bread offered once a-year. It has suffered so much by earthquakes, that little of the original structure remains, and the modern parts have hardly any thing except their materials to recommend them. The other religious edifices of the city are profusely ornamented, but in a bad taste. The spirit of building seems to have seized upon this people, and the prince of Biscari's example adds fresh vigour. It were natural to suppose men would be backward in erecting new habitations, especially with any degree of luxury, on ground so often shaken to its centre, and so often buried under the ashes of a volcano; but such is their attachment to their native soil, and their contempt of dangers they are habituated to, that they rebuild their houses on the warm cinders of Vesuvius, the quaking plains of Calabria, and the black mountains of Sciarra at Catania; it is however surprising to see such embellishments lavished in so dangerous a situation. There is a great deal of activity in the disposition of this people: they know by tradition that their ancestors carried on a flourishing commerce; and that, before the fiery river filled it up, they had a spacious convenient harbour, where they now have scarce a creek for a felucca: they therefore wish to restore those advantages to Catania, and have often applied to government for assistance towards forming a mole and port, an undertaking their strength alone is unequal to; but whether the refusal originates in the deficiencies of the public treasury or the jealousy of other cities, all their projects have ended in fruitless applications. The number of inhabitants dwelling in Catania amounts to 30,000; the Catanians make it double: A considerable portion of this number appertains to the university, the only one in the island, and the nursery of all the lawyers." E. Long. 15. 19. N. Lat. 37. 30.

CATANZARO, a city in the kingdom of Naples, the capital of Calabria Ulterior, with a bishop's see. It is the usual residence of the governor of the province, and is seated on a mountain, in E. Long. 18. 20. N. Lat. 38. 58.

CATAPHONICS, the science which considers the properties of reflected sounds. See ACOUSTICS.

CATAPHORA, in medicine, the same as COMA.

CATAPHRACTA (from *κατα*, and *φρασσα*, I for-

tify or arm), in the ancient military art, a piece of heavy defensive armour, formed of cloth or leather, fortified with iron scales or links, wherewith sometimes only the breast, sometimes the whole body, and sometimes the horse too, was covered. It was in use among the Sarmatians, Persians, and other Barbarians. The Romans also adopted it early for their foot; and, according to Vegetius, kept to it till the time of Gratian, when the military discipline growing remiss, and field exercises and labour discontinued, the Roman foot thought the cataphracta as well as the helmet too great a load to bear, and therefore threw both by, choosing rather to march against the enemy bare-breasted; by which, in the war with the Goths, multitudes were destroyed.

CATAPHRACTÆ *Naves*, ships armed and covered in fight, so that they could not be easily damaged by the enemy. They were covered over with boards or planks, on which the soldiers were placed to defend them; the rowers sitting underneath, thus screened from the enemy's weapons.

CATAPHRACTUS, denotes a thing defended or covered on all sides with armour.

CATAPHRACTUS, or *Cataphractorius*, more particularly denotes a horseman, or even horse, armed with a cataphracta. The *cataphracta equites* were a sort of cuirassiers, not only fortified with armour themselves, but having their horses guarded with solid plates of brass or other metals, usually lined with skins and wrought into plumes or other forms. Their use was to bear down all before them, to break in upon the enemies ranks, and spread terror and havock wherever they came, as being themselves invulnerable and secure from danger. But their disadvantage was their unwieldiness, by which, if once unhorsed or on the ground, they were unable to rise, and thus fell a prey to the enemy.

CATAPHRYGIANS, a sect in the second century, so called as being of the country of Phrygia. They were orthodox in every thing, setting aside this, that they took Montanus for a prophet, and Priscilla and Maximilla for true prophetesses, to be consulted in every thing relating to religion; as supposing the Holy spirit had abandoned the church. See MONTANIST.

CATAPLASMA, a poultice; from *καταπλασσω*, *illino*, to spread like a plaster. Cataplasms take their name sometimes from the part to which they are applied, or effects they produce; so are called *anacollema*, *frontale*, *epicarpium*, *epispasticum*, *vesicatorium*; and when mustard is an ingredient, they are called *sinapisms*.

These kind of applications are softer and more easy than plasters or ointments. They are formed of some vegetable substances, and applied of such a consistence as neither to adhere nor run: they are also more useful when the intention is effected by the perpetuity of the heat or cold which they contain, for they retain them longer than any other kind of composition.

When designed to *relax*, or to promote suppuration, they should be applied warm. Their warmth, moisture, and the obstruction they give to perspiration, is the method of their answering that end. The proper heat, when applied warm, is no more than to promote a kindly pleasant sensation; for great heat prevents the design for which they are used. They should be renewed as often as they cool. For relaxing and

Cataphrac-
ta
||
Cataplas-
ma.

Catapulta. and suppurating, none excel the white-bread poultice, made with the crumb of an old loaf, a sufficient quantity of milk to boil the bread in until it is soft, and a little oil; which last ingredient, besides preventing the poultice from drying and sticking to the skin, also retains the heat longer than the bread and milk alone would do. To preserve the heat longer, the poultice, when applied, may be covered with a strong ox's bladder.

When designed to *repel*, they should be applied cold, and ought to be renewed as oft as they become warm. A proper composition for this end is a mixture of oatmeal and vinegar.

CATAPULTA, in antiquity, a military engine contrived for the throwing of arrows, darts, and stones upon the enemy.—Some of these engines were of such force that they would throw stones of an hundred weight. Josephus takes notice of the surprising effects of these engines, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level a whole file of men from one end to the other, was the phalanx ever so deep. This was called the

Battering CATAPULTA, and is represented on Plate CXXVII. This catapulta is supposed to carry a stone, &c. of an hundred weight, and therefore a description of it will be sufficient to explain the doctrine of all the rest; for such as threw stones of 500 and upwards were constructed on the same principles.

The base is composed of two large beams 2, 3. The length of those beams is fifteen diameters of the bore of the capitals 9. At the two extremities of each beam, two double mortises are cut to receive the eight tenons of two cross beams, each of them four of the diameters in length. In the centre of each of the beams of the base, and near two thirds of their length, a hole, perfectly round, and 16 inches in diameter, should be bored: these holes must be exactly opposite to each other, and should increase gradually to the inside of the beams, so that each of them, being 16 inches on the outside towards the capitals 9, should be $17\frac{1}{2}$ at the opening on the inside, and the edges carefully rounded off. The capitals 9 are, in a manner, the soul of the machine, and serve to twist and strain the cordage, which forms its principle or power of motion.

The capitals are either of cast brass or iron; each consisting of a wheel with teeth, C 10, of $2\frac{1}{2}$ inches thick. The hollow or bore of these wheels should be $11\frac{1}{4}$ inches in diameter, perfectly round, and the edges smoothed down. As the friction would be too great, if the capitals rubbed against the beams, by the extreme straining of the cordage, which draws them towards these beams, that inconvenience is remedied by the means of eight friction-wheels, or cylinders of brass, about the 13th of an inch in diameter, and an inch and one sixth in length, placed circularly, and turning upon axes, as represented at D 13, B 12. One of these friction-wheels at large with its screw, by which it is fastened into the beam, is represented at A.

Upon this number of cylindrical wheels the capitals 9 must be placed in the beams, 2, 3, so that the cylinders do not extend to the teeth of the wheels, which must receive a strong pinion 14. By the means of this

Nº 67.

2

pinion the wheel of the capital is made to turn for straining the cordage with the key 15. The capital wheel has a strong catch 16, and another of the same kind may be added to prevent any thing from giving way through the extreme and violent force of the strained cordage.

The capital-piece of the machine is a nut or cross-pin of iron, 17, seen at C, and hammered cold into its form. It divides the bore of the capitals exactly in two equal parts, and fixed in groves about an inch deep. This piece, or nut, ought to be about two inches and one-third thick at the top 18, as represented in the section at B; and rounded off and polished as much as possible, that the cords folded over it may not be hurt or cut by the roughness or edges of the iron. Its height ought to be eight inches, decreasing gradually in thickness to the bottom, where it ought to be only one inch. It must be very exactly inserted in the capitals.

After placing the two capitals in the holes of the two beams in a right line with each other, and fixing the two cross diametrical nuts or pieces over which the cordage is to wind, one end of the cord is reeved through a hole in one of the capitals in the base, and made fast to a nail within-side of the beam. The other side of the cord is then carried through the hole in the opposite beam and capital, and so wound over the cross pieces of iron in the centre of the two capitals, till they are full, the cordage forming a large skain. The tension or straining of the cordage ought to be exactly equal, that is, the several foldings of the cord over the capital-pieces should be equally strained, and so near each other as not to leave the least space between them. As soon as the first folding or skain of cord has filled up one whole space or breadth of the capital pieces, another must be carried over it; and so on, always equally straining the end till no more will pass through the capitals, and the skain of cordage entirely fills them, observing to rub it from time to time with soap.

At three or four inches behind the cordage, thus wound over the capital pieces, two very strong upright beams 21 are raised: these are posts of oak 14 inches thick, crossed over at top by another of the same solidity. The height of the upright beams is $7\frac{1}{2}$ diameters; each supported behind with very strong props 25, fixed at bottom in the extremities of the base 2, 3. The cross beam 24 is supported in the same manner by a prop in the centre.

The tree, arm, or stylus 22, should be of sound ash. Its length is from 15 to 16 diameters of the bore of the capitals. The end at the bottom, or that fixed in the middle of the skain, is 10 inches thick, and 14 broad. To strengthen the arm or tree, it should be wrapped round with a cloth dipped in strong glue like the tree of a saddle, and bound very hard with waxed thread of the sixth of an inch in diameter from the large end at bottom, almost to the top, as represented in the figure.

At the top of the arm, just under the iron-hand or receiver 27, a strong cord is fastened, with two loops twisted one within another, for the greater strength. Into these two loops the hook of a brass pulley 28 is put. The cord 29 is then reeved through the pulley, and fastened to the roll 30. The cock or trigger 31, which

Catapulta
||
Catarrh.

which serves as a stay, is then brought to it, and made fast by its hook to the extremity of the hand 27, in which the body to be discharged is placed. The pulley at the neck of the arm is then unhooked; and when the trigger is to let it off, a stroke must be given upon it with an iron bar or crow of about an inch in diameter; on which the arm flies up with a force almost equal to that of a modern mortar. The cushion or stomacher 23, placed exactly in the middle of the cross beam 24, should be covered with tanned ox-hide, and stuffed with hair, the arm striking against it with inconceivable force. It is to be observed, that the tree or arm 22 describes an angle of 90 degrees, beginning at the cock, and ending at the stomacher or cushion.

CATAPULTA for Arrows, Spears, or Darts. Some of the spears, &c. thrown by these engines, are said to have been 18 feet long, and to have been thrown with such velocity as to take fire in their course.

Fig. 2.

A B C D is the frame that holds the darts or arrows, which may be of different numbers, and placed in different directions. E F is a large and strong iron spring, which is bent by a rope that goes over three pullies, I, K, L; and is drawn by one or several men; this rope may be fastened to a pin at M. The rope, therefore, being set at liberty, the spring must strike the darts with great violence, and send them, with surprising velocity, to a great distance. This instrument differs in some particulars from the description we have of that of the ancients; principally in the throwing of several darts at the same time, one only being thrown by theirs.

CATARACT, in hydrography, a precipice in the channel of a river, caused by rocks, or other obstacles, stopping the course of the stream, from whence the water falls with a greater noise and impetuosity. The word comes from *καταρρασσω*, "I tumble down with violence;" compounded of *κατα*, "down," and *ρασσω*, *dejicio*, "I throw down."—Such are the cataracts of the Nile, the Danube, Rhine, &c. In that of Niagara, the perpendicular fall of the water is 137 feet: and in that of Pistill Rhaiadr, in North Wales, the fall of water is near 240 feet from the mountain to the lower pool.

Strabo calls that a *cataraē* which we call a *cascade*; and what we call a *cataraē*, the ancients usually called a *catadupa*. Herminius has an express dissertation, "De admirandis mundi Cataraētis supra et subterraneis;" where he uses the word in a new sense; signifying, by cataract, any violent motion of the elements.

CATARACT, in medicine and surgery, a disorder of the humours of the eye, by which the pupilla, that ought to appear transparent and black, looks opaque, blue, grey, brown, &c. by which vision is variously impeded, or totally destroyed. See *SURGERY*.

CATARO, a town of Dalmatia, and capital of the territory of the same name, with a strong castle, and a bishop's see. It is subject to Venice, and seated on a gulph of the same name. E. Long. 19. 19. N. Lat. 42. 25.

CATARACTES, in ornithology, the trivial name of a species of *LARUS*.

CATARRH, in medicine, a distillation or defluxion

from the head upon the mouth and aspera arteria, and through them upon the lungs. See (the *Index* subjoined to) *MEDICINE*.

CATASTASIS in poetry, the third part of the ancient drama; being that wherein the intrigue, or action, set forth in the epitasis, is supported, carried on, and heightened, till it be ripe for the unravelling in the catastrophe. Scaliger defines it, the full growth of the fable, while things are at a stand in that confusion to which the poet has brought them.

CATASTROPHE, in dramatic poetry, the fourth and last part in the ancient drama; or that immediately succeeding the catastasis: or, according to others, the third only; the whole drama being divided into protasis, epitasis, and catastrophe; or in the terms of Aristotle, prologue, epilogue, and exode.

The catastrophe clears up every thing, and is nothing else but the discovery or winding up of the plot. It has its peculiar place: for it ought entirely to be contained, not only in the last act, but in the very conclusion of it; and when the plot is finished, the play should be so also. The catastrophe ought to turn upon a single point, or start up on a sudden.

The great art in the catastrophe is, that the clearing up of all difficulties may appear wonderful, and yet easy, simple, and natural.

It is a very preposterous artifice of some writers to show the catastrophe in the very title of the play. Mr Dryden thinks that a catastrophe resulting from a mere change in the sentiments and resolutions of a person, without any other machinery, may be so managed as to be exceedingly beautiful.

It is a dispute among the critics, whether the catastrophe should always fall out favourably on the side of virtue or not. The reasons on the negative side seem the strongest. Aristotle prefers a shocking catastrophe to a happy one.—The catastrophe is either simple or complex. The first is that in which there is no change in the state of the principal persons, nor any discovery or unravelling, the plot being only a mere passage out of agitation into quiet repose. In the second, the principal persons undergo a change of fortune, in the manner already defined.

CATCH, in the musical sense of the word, a fugue in the unison, wherein, to humour some conceit in the words, the melody is broken, and the sense interrupted in one part, and caught again or supported by another; as in the catch in Shakespeare's play of the Twelfth-night, where there is a catch sung by three persons, in which the humour is, that each who sings, calls and is called *knave* in turn: Or, as defined by Mr Jackson, "a catch is a piece for three or more voices, one of which leads, and the others follow in the same notes. It must be so contrived, that rests (which are made for that purpose) in the music of one line be filled up with a word or two from another line; these form a cross purpose, or catch, from whence the name."

CATCH-Fly, in botany. See *LYCHNIS*.

CATCH-Pole, (quasi one that catches by the pole), a term used, by way of reproach, for the bailiff's follower or assistant.

CATCH-Word, among printers, that placed at the bottom of each page, being always the first word of the following page.

CATECHESIS, in a general sense, denotes an instruction

Catastasis

Catechesis.

Catechetic
||
Catechu-
men.

struction given any person in the first rudiments of an art or science; but more particularly of the Christian religion. In the ancient church, catechesis was an instruction given *viva voce*, either to children, or adult heathens, preparatory to their receiving of baptism. In this sense, *catechesis* stands contradistinguished from *myslagogica*, which were a higher part of instruction given to those already initiated, and containing the mysteries of faith. Those who give such instructions are called *catechists*; and those who receive them, *catechumens*.

CATECHETIC, or CATECHETICAL, something that relates to oral instruction in the rudiments of Christianity.—Catechetic schools were buildings appointed for the office of the catechist, adjoining to the church, and called *catechumena*: such was that in which Origen and many other famous men read catechetical lectures at Alexandria. See CATECHUMEN.

CATECHISM, in its primary sense, an instruction, or institution, in the principles of the Christian religion, delivered *viva voce*, and so as to require frequent repetitions, from the disciple or hearer, of what has been said. The word is formed from *κατηχησις*, a compound of *κατα* and *χῆσις*, q. d. *circumsono*, alluding to the noise or din made in this sort of exercise, or to the zeal and earnestness wherewith things are to be inculcated over and over on the learners.—Anciently the candidates for baptism were only to be instructed in the secrets of their religion by tradition *viva voce*, without writing; as had also been the case among the Egyptian priests, and the British and Gaulish druids, who only communicated the mysteries of their theology by word of mouth.

CATECHISM is more frequently used in modern times for an elementary book, wherein the principal articles of religion are summarily delivered in the way of question and answer.

CATECHIST, *κατηχιστής*, *catecheta*, he that catechises, i. e. he that instructs novices in the principles of religion.

CATECHIST more particularly denotes a person appointed by the church to instruct those intended for baptism, by word of mouth, in the fundamental articles of the Christian faith.—The catechists of churches were ministers usually distinct from the bishops and presbyters, and had their auditories or *catechumena* apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the catechists did not constitute any distinct order of the clergy, but were chosen out of any other order. The bishop himself sometimes performed the office; at other times presbyters, or even readers or deacons, were the catechists. Origen seems to have had no higher degree in the church than reader, when he was made catechist at Alexandria, being only 18 years of age, and consequently incapable of the deaconship.

CATECHU, in the materia medica, the name of a troche consisting of Japan earth and gum arabic, each two ounces, and of sugar of roses sixteen ounces, beat together with a little water. It is recommended as a mild refringent, &c.

CATECHUMEN, a candidate for baptism, or one who prepares himself for the receiving thereof.

The catechumens, in church-history, were the low-

est order of Christians in the primitive church. They had some title to the common name of Christian, being a degree above pagans and heretics, though not consummated by baptism. They were admitted to the state of catechumens by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens, as soon as ever they were capable of instruction: but at what age those of heathen parents might be admitted, is not so clear. As to the time of their continuance in this state, there were no general rules fixed about it; but the practice varied according to the difference of times and places, and the readiness and proficiency of the catechumens themselves.

There were four orders or degrees of catechumens; the first were those instructed privately without the church, and kept at a distance for some time from the privilege of entering the church, to make them the more eager and desirous of it. The next degree were the *audientes*, so called from their being admitted to hear sermons, and the scriptures read in the church, but were not allowed to partake of the prayers. The third sort of catechumens were the *genu-flectentes*, so called because they received imposition of hands kneeling. The fourth order was the *competentes* & *electi*, denoting the immediate candidates for baptism, or such as were appointed to be baptized the next approaching festival; before which, strict examination was made into their proficiency under the several stages of catechetical exercises.

After examination, they were exercised for twenty days together, and were obliged to fasting and confession: some days before baptism they went veiled; and it was customary to touch their ears, saying, *Ephatha*, i. e. Be opened; as also to anoint their eyes with clay; both ceremonies being in imitation of our Saviour's practice, and intended to shadow out to the catechumens their condition both before and after their admission into the Christian church.

CATEGORICAL, in a general sense, is applied to those things ranged under a CATEGORY.

CATEGORICAL also imports a thing to be absolute, and not relative; in which sense it stands opposed to *hypothetical*. We say, a *categorical* proposition, a *categorical* syllogism, &c.

A *categorical* answer denotes an express and pertinent answer made to any question or objection proposed.

CATEGORY, in logic, a series or order of all the predicates or attributes contained under any genus.

The school-philosophers distribute all the objects of our thoughts and ideas into certain *genera* or classes, not so much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know; and these classes the Greeks called *categories*, and the Latins *predicaments*.

Aristotle made ten categories, viz. quantity, quality, relation, action, passion, time, place, situation, and habit, which are usually expressed by the following technical distich:

*Arbor, sex, servos, ardore, refrigerat, ustos,
Rure cras flabo, nec tunicatus ero.*

CATEK. See BENGAL, n° 15.

CATENARIA, in the higher geometry, the name of a curve-line formed by a rope hanging freely from

Caterpillar two points of suspension, whether the points be horizontal or not. See FLUXIONS.

CATERPILLAR, in zoology, the name of all winged insects when in their reptile or worm-state. See ERUCA.

Method of Destroying CATERPILLARS on Trees.—Take a chafing dish with lighted charcoal, and placing it under the branches that are loaded with caterpillars, throw some pinches of brimstone upon the coals. The vapour of the sulphur, which is mortal to these insects, will not only destroy all that are on the tree, but prevent it from being infested with them afterwards. A pound of sulphur will clear as many trees as grow on several acres. This method has been successfully tried in France. In the *Journal Oeconomique*, the following is said to be infallible against the caterpillars feeding on cabbage, and perhaps may be equally serviceable against those that infest other vegetables. Sow with hemp all the borders of the ground where you mean to plant your cabbage; and, although the neighbourhood is infested with caterpillars, the space inclosed by the hemp will be perfectly free, not one of the vermin will approach it.

CATERPILLAR-Eaters, a name given by some authors to a species of worms bred in the body of the caterpillar, and which eat its flesh: these are owing to a certain kind of fly that lodges her eggs in the body of this animal, and they, after their proper changes, become flies like their parents.

Mr Reaumur has given us, in his history of insects, some very curious particulars in regard to these little worms. Every one of them, he observes, spins itself a very beautiful case of a cylindric figure, made of a very strong sort of silk; these are the cases in which this animal spends its state of chrysalis; and they have a mark by which they may be known from all other animal productions of this kind, which is, that they have always a broad stripe or band surrounding their middle, which is black when the rest of the case is white, and white when that is black. Mr Reaumur has had the pains and patience to find out the reason of this singularity, which is this: the whole shell is spun of a silk produced out of the creature's body; this at first runs all white, and towards the end of the spinning turns black. The outside of the case must necessarily be formed first, as the creature works from within: consequently this is truly white all over, but it is transparent, and shows the last spun or black silk through it. It might be supposed that the whole inside of the shell should be black; but this is not the case: the whole is fashioned before this black silk comes; and this is employed by the creature, not to line the whole, but to fortify certain parts only; and therefore is all applied either to the middle, or to the two ends omitting the middle; and so gives either a black band in the middle, or a blackness at both ends, leaving the white in the middle to appear. It is not unfrequent to find a sort of small cases, lying about garden-walks, which move of themselves; when these are opened, they are found to contain a small living worm. This is one of the species of these caterpillar-eaters; which, as soon as it comes out of the body of that animal, spins itself a case for its transformation long before that happens, and lives in it without food

till that change comes on; and it becomes a fly like that to which it owed its birth.

CATERVA, in ancient military writers, a term used in speaking of the Gaulish or Celtiberian armies, denoting a body of 6000 armed men. The word *caterva*, or *catervarius*, is also frequently used by ancient writers to denote a party or corps of soldiers in disorder or disarray: by which it stands distinguished from cohort or turma, which were in good order.

CATESBÆA, the LILY-THORN: A genus of the monogynia order, belonging to the tetrandria class of plants; and in the natural method ranking under the 28th order, *Luride*. The corolla is monopetalous, funnel-shaped, very long above the receptacle of the fruit; the stamina are within its throat; the fruit a polyspermous berry. There is only one species, viz. the spinosa, which was discovered in the island of Providence by Mr Catesby, who gathered the seeds, and brought them to England. It rises to the height of ten or twelve feet, and is covered with a pale russet bark; the branches come out alternately, and are garnished with small leaves resembling those of the box-tree, coming out in clusters all round the branches at certain distances; the flowers hang downward, and come out from the side of the branches: they are tubulous and near six inches long, very narrow at their base, but widening upwards towards the top, where it is divided into four parts which spread open, and are reflexed backward. They are of a dull yellow colour. This plant is propagated by seeds which must be procured from the country where it grows. The seeds must be sown on a hot-bed, and are to be treated in the same manner as other tender exotics.

CATHÆRETICS, in pharmacy, medicines of a caustic nature, serving to eat off proud flesh.

CATHARINE, *Knights of St CATHARINE of Mount Sinai*, an ancient military order, erected for the assistance and protection of pilgrims going to pay their devotions to the body of St Catharine, a virgin of Alexandria, distinguished for her learning, and said to have suffered martyrdom under Maximin. The body of the martyr having been discovered on mount Sinai, caused a great concourse of pilgrims; and travelling being very dangerous, by reason of the Arabs, an order of knighthood was erected in 1063, on the model of that of the holy sepulchre, and under the patronage of St Catharine: the knights of which obliged themselves by oath to guard the body of the saint, keep the roads secure, observe the rule of St Basil, and obey their grand master. Their habit was white, and on it were represented the instruments of martyrdom whereby the saint had suffered; viz. a half-wheel armed with spikes, and traversed with a sword stained with blood.

CATHARINE, *Fraternity of St Catharine at Sienna*, a sort of religious society instituted in that city, in honour of St Catharine, a saint famous for her revelations, and for her marriage with Jesus Christ, whose wedding ring is still preserved as a valuable relic. This fraternity yearly endows a certain number of destitute virgins, and has the privilege of redeeming annually two criminals condemned for murder, and the same number of debtors, by paying their debts.

CATHARTICS, in medicine, remedies which promote

Caterwa
||
Cathartics.

Cathecu mote evacuation by stool. See MATERIA MEDICA.

CATHECU, in botany. See ARECA.

CATHEDRA, in a general sense, a chair.—The word is more particularly used for a professor's chair, and a preacher's pulpit.

CATHEDRA is also used for the bishop's see, or throne, in a church.

CATHEDRAL, a church wherein is a bishop's see or seat: See CHURCH, and BISHOP. The word comes from the Greek *καθιδρα*, "chair," of *καθίζομαι*, *sedeo*, "I sit." The denomination *cathedral* seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive Christians: in these, the council, i. e. the elders and priests, was called *Presbyterium*; at their head was the bishop, who held the place of chairman, *Cathedralis*, or *Cathedraticus*; and the presbyters, who sat on either side, were also called by the ancient fathers, *Assessores Episcoporum*. The episcopal authority did not reside in the bishop alone; but in all the presbyters, whereof the bishop was president. A *cathedral* therefore, originally, was different from what it is now; the Christians, till the time of Constantine, having no liberty to build any temple: by their churches they only meant their assemblies; and by *ca'hedrals*, nothing more than consistories.

CATHERINE PARR. See PARR.

CATHERINE I. *Empress of Russia*, a most extraordinary personage, whose history deserves to be given in detail. She was the natural daughter of a country girl; and was born at Ringen, a small village upon the lake Virtcherve, near Dorpt, in Livonia. The year of her birth is uncertain; but, according to her own account, she came into the world on the 5th of April, 1687. Her original name was Martha, which she changed for Catherine when she embraced the Greek religion. Count Rosen, a lieutenant-colonel in the Swedish service, who owned the village of Ringen, supported, according to the custom of the country, both the mother and the child; and was, for that reason, supposed by many persons to have been her father. She lost her mother when she was but three years old; and, as count Rosen died about the same time, she was left in so destitute a situation, that the parish-clerk of the village received her into his house. Soon afterwards Gluck, Lutheran minister of Marienburgh, happening, in a journey through those parts, to see the foundling, took her under his protection, brought her up in his family, and employed her in attending his children. In 1701, and about the 14th year of her age, she espoused a dragoon of the Swedish garrison of Marienburgh. Many different accounts are given of this transaction: one author of great credit affirms that the bride and bridegroom remained together eight days after their marriage; another, of no less authority, asserts, on the contrary, that on the morning of the nuptials her husband being sent with a detachment for Riga, the marriage was never consummated. Thus much is certain, that the dragoon was absent when Marienburgh surrendered to the Russians; and Catherine, who was reserved for a higher fortune, never saw him more.

General Bauer, upon the taking of Marienburgh, saw Catherine among the prisoners; and, being smitten with her youth and beauty, took her to his house,

where she superintended his domestic affairs, and was supposed to be his mistress. Soon afterwards she was removed into the family of prince Menzikof, who was no less struck with the attractions of the fair captive. With him she lived until 1704; when, in the 17th year of her age, she became the mistress of Peter the Great, and won so much upon his affections, that he espoused her on the 29th of May 1711. The ceremony was secretly performed at Jawerof in Poland, in the presence of General Bruce; and on the 20th of February 1712, it was publicly solemnized with great pomp at Peterburgh.

Catherine, by the most unwearied assiduity and unremitted attention, by the softness and complacency of her disposition, but above all by an extraordinary liveliness and gaiety of temper, acquired a wonderful ascendancy over the mind of Peter. The latter was subject to occasional horrors, which at times rendered him gloomy and suspicious, and raised his passions to such an height as to produce a temporary madness. In these dreadful moments Catherine was the only person who durst venture to approach him; and such was the kind of fascination she had acquired over his senses, that her presence had an instantaneous effect, and the first sound of her voice composed his mind and calmed his agonies. From these circumstances she seemed necessary, not only to his comfort, but even to his very existence; she became his inseparable companion on his journeys into foreign countries, and even in all his military expeditions.

The peace of Pruth, by which the Russian army was rescued from certain destruction, has been wholly attributed to Catherine, though she was little more than an instrument in procuring the consent of Peter. The latter, in his campaign of 1711 against the Turks, having imprudently led his troops into a disadvantageous situation, took the desperate resolution of cutting his way through the Turkish army in the night. With this resolution he retired to his tent in an agony of despair, and gave positive orders that no one should be admitted under pain of death. In this important juncture the principal officers and the vice-chancellor Shaffirof assembled in the presence of Catherine, and drew up certain preliminaries in order to obtain a truce from the grand vizir. In consequence of this determination, plenipotentiaries were immediately dispatched, without the knowledge of Peter, to the grand vizir, and a peace obtained upon more reasonable conditions than could have been expected. With these conditions Catherine, notwithstanding the orders issued by Peter, entered his tent, and prevailed upon him to sign them. Catherine, by her conduct on this occasion, acquired great popularity; and the emperor particularly specifies her behaviour at Pruth as one of the reasons which induced him to crown her publicly at Moscow with his own hand. This ceremony was performed in 1724; and although designed by Peter only as a proof of his affection, was the principal cause of her subsequent elevation.

Her influence continued undiminished until a short time before the death of the emperor, when some circumstances happened which occasioned such a coolness between them as would probably have ended in a total rupture, if his death had not fortunately intervened. The original

Catherine. original cause of this misunderstanding arose from the following discovery of a secret connection between Catherine and her first chamberlain, whose name was Mons. The emperor, who was suspicious of this connection, quitted Petersburg under pretence of removing to a villa for a few days, but privately returned to his winter palace in the capital. From thence he occasionally sent one of his confidential pages with a complimentary message to the empress, as if he had been in the country, and with secret orders to observe her motions. From the page's information the emperor, on the third night, surprized Catherine in an arbour of the garden with her favourite Mons; while his sister, Madame Balke, who was first lady of the bed-chamber to the empress, was, in company with a page, upon the watch without the arbour.

Peter, whose violent temper was inflamed by this discovery, struck Catherine with his cane, as well as the page, who endeavoured to prevent him from entering the arbour, and then retired without uttering a single word either to Mons or his sister. A few days after this transaction these persons were taken into custody, and Mons was carried to the winter palace, where no one had admission to him but Peter, who himself brought him his provisions. A report was at the same time circulated, that they were imprisoned for having received bribes, and making their influence over the empress subservient to their own mercenary views. Mons being examined by Peter, in the presence of major-general Ushakof, and threatened with the torture, confessed the corruption which was laid to his charge. He was beheaded; his sister received five strokes of the knout, and was banished into Siberia; two of her sons, who were chamberlains, were also degraded, and sent as common foldiers among the Russian troops in Persia. On the day subsequent to the execution of the sentence, Peter conveyed Catherine in an open carriage under the gallows, to which was nailed the head of Mons. The empress, without changing colour at this dreadful sight, exclaimed, "What a pity it is that there is so much corruption among courtiers!"

This event happened in the latter end of the year 1724; and as it was soon followed by Peter's death, and Catherine upon her accession recalled Madame Balke, it has been suspected that she shortened the days of her husband by poison. But notwithstanding the critical situation for Catherine in which he died, and her subsequent elevation, this charge is totally destitute of the least shadow of proof: for the circumstances of Peter's disorder were too well known, and the peculiar symptoms of his last illness sufficiently account for his death, without the necessity of recurring to poison.

While Peter was yet lying in the agonies of death, several opposite parties were caballing to dispose of the crown. At a considerable meeting of many among the principal nobility, it was secretly determined, on the moment of his dissolution, to arrest Catherine, and to place Peter Alexievitch upon the throne. Bassevitz, apprized of this resolution, repaired in person to the empress, although it was already night. "My grief and consternation," replied Catherine, "render me incapable of acting myself: do you and prince Menzikof consult together, and I will embrace the measures

which you shall approve in my name." Bassevitz, finding Menzikof asleep, awakened and informed him of the pressing danger which threatened the empress and her party. As no time remained for long deliberation, the prince instantly seized the treasure, secured the fortress, gained the officers of the guards by bribes and promises, also a few of the nobility, and the principal clergy. These partizans being convened in the palace, Catherine made her appearance: she claimed the throne in right of her coronation at Moscow; she exposed the ill effects of a minority; and promised, that, "so far from depriving the great-duke of the crown, she would receive it only as a sacred deposit, to be restored to him when she should be united, in another world, to an adored husband, whom she was now upon the point of losing."

The pathetic manner with which she uttered this address, and the tears which accompanied it, added to the previous distribution of large sums of money and jewels, produced the desired effect: at the close of this meeting the remainder of the night was employed in making the necessary preparations to insure her accession in case of the emperor's death.

Peter at length expired in the morning of the 28th of January 1725. This event being made known, the senate, the generals, the principal nobility and clergy, hastened to the palace to proclaim the new sovereign. The adherents of the great-duke seemed secure of success, and the friends of Catherine were avoided as persons doomed to destruction. At this juncture Bassevitz whispered one of the opposite party, "The empress is mistress of the treasure and the fortress; she has gained over the guards and the synod, and many of the chief nobility; even here she has more followers than you imagine; advise therefore your friends to make no opposition as they value their heads." This information being rapidly circulated, Bassevitz gave the appointed signal, and the two regiments of guards, who had been gained by a largesse to declare for Catherine, and had already surrounded the palace, beat to arms. "Who has dared (exclaimed prince Repnin, the commander in chief) to order out the troops without my knowledge?" "I, (returned general Butterlin), without pretending to dispute your authority, in obedience to the commands of my most gracious mistress." This short reply was followed by a dead silence. In this moment of suspense and anxiety Menzikof entered, preceding Catherine, supported by the duke of Holstein. She attempted to speak, but was prevented by sighs and tears from giving utterance to her words: at length, recovering herself, "I come (she said), notwithstanding the grief which now overwhelms me, to assure you, that, submissive to the will of my departed husband, whose memory will be ever dear to me, I am ready to devote my days to the painful occupations of government until Providence shall summon me to follow him." Then, after a short pause, she artfully added, "If the great-duke will profit by my instructions, perhaps I shall have the consolation, during my wretched widowhood, of forming for you an emperor worthy of the blood and the name of him whom you have now irretrievably lost." "As this crisis (replied Menzikof) is a moment of such importance to the good of the empire, and requires the most mature deliberation, your majesty

Catherine. jectly will permit us to confer, without restraint, that this whole affair may be transacted without reproach, as well in the opinion of the present age as in that of posterity." "Acting as I do (answered Catherine), more for the public good than for my own advantage, I am not afraid to submit all my concerns to the judgment of such an enlightened assembly: you have not only my permission to confer with freedom; but I lay my commands upon you all to deliberate maturely on this important subject, and I promise to adopt whatever may be the result of your decisions." At the conclusion of these words the assembly retired into another apartment, and the doors were locked.

It was previously settled by Menzikof and his party that Catherine should be empress; and the guards, who surrounded the palace with drums beating and colours flying, effectually vanquished all opposition. The only circumstance, therefore, which remained, was to give a just colour to her title, by persuading the assembly that Peter intended to have named her his successor. For this purpose Menzikof demanded of that emperor's secretary, whether his late master had left any written declaration of his intentions? The secretary replied, "That a little before his last journey to Moscow he had destroyed a will; and that he had frequently expressed his design of making another, but had always been prevented by the reflection, that if he thought his people, whom he had raised from a state of barbarism to an high degree of power and glory, could be ungrateful, he would not expose his final inclinations to the insult of a refusal; and that if they recollected what they owed to his labours, they would regulate their conduct by his intentions, which he had disclosed with more solemnity than could be manifested by any writing." An altercation now began in the assembly; and some of the nobles having the courage to oppose the accession of Catherine, Theophanes archbishop of Plescof called to their recollection the oath which they had all taken in 1722 to acknowledge the successor appointed by Peter; and added, that the sentiments of that emperor delivered by the secretary were in effect an appointment of Catherine. The opposite party, however, denied these sentiments to be so clear as the secretary chose to insinuate; and insisted, that as their late monarch had failed to nominate his heir, the election of the new sovereign should revert to the state. Upon this the archbishop farther testified, that the evening before the coronation of the empress at Moscow, Peter had declared, in the house of an English merchant, that he should place the crown upon her head with no other view than to leave her mistress of the empire after his decease. This attestation being confirmed by many persons present, Menzikof cried out, "What need have we of any testament! A refusal to conform to the inclination of our great sovereign, thus authenticated, would be both unjust and criminal. Long live the empress Catherine!" These words being instantaneously repeated by the greatest part of those who were present, Menzikof, saluting Catherine by the title of empress, paid his first obeisance by kissing her hand; and his example was followed by the whole assembly. She next presented herself at the window to the guards, and to the people, who shouted acclamations of "Long live Catherine!" while Menzikof

scattered amongst them handfuls of money. Thus Catherine. (says a contemporary) the empress was raised to the throne by the guards, in the same manner as the Roman emperors by the prætorian cohorts, without either the appointment of the people or of the legions.

The reign of Catherine may be considered as the reign of Menzikof, that empress having neither inclination or abilities to direct the helm of government; and she placed the most implicit confidence in a man who had been the original author of her good fortune, and the sole instrument of her elevation to the throne.

During her short reign her life was very irregular; she was extremely averse to business; would frequently, when the weather was fine, pass whole nights in the open air; and was particularly intemperate in the use of tokay-wine. These irregularities, joined to a cancer and a dropsy, hastened her end; and she expired on the 17th of May 1727, a little more than two years after her accession to the throne, and in about the 40th year of her age.

As the deaths of sovereigns in despotic countries are seldom imputed to natural causes, that of Catherine has also been attributed to poison; as if the disorders which preyed upon her frame were not sufficient to bring her to her grave. Some assert, that she was poisoned in a glass of spirituous liquor; others, by a pear given her by general Diever. Suspicions also fell upon prince Menzikof, who, a short time before her decease, had a trifling misunderstanding with her, and who was accused of hastening her death, that he might reign with still more absolute power during the minority of Peter II. But these reports deserve not the least credit, and were merely dictated by the spirit of party or by popular rumour.

Catherine was in her person under the middle-size, and in her youth delicate and well-formed, but inclined to corpulency as she advanced in years. She had a fair complexion, dark eyes, and light hair, which she was always accustomed to dye with a black colour. She could neither read nor write: her daughter Elizabeth usually signed her name for her, and particularly to her last will and testament; and count Osterman generally put her signature to the public decrees and dispatches. Her abilities have been greatly exaggerated by her panegyrists. Gordon, who had frequently seen her, seems, of all writers, to have represented her character with the greatest justness, when he says, "She was a very pretty well-look'd woman, of good sense, but not of that sublimity of wit, or rather that quickness of imagination, which some people have believed. The great reason why the czar was so fond of her, was her exceeding good temper; she never was seen peevish or out of humour; obliging and civil to all, and never forgetful of her former condition; withal, mighty grateful." Catherine maintained the pomp of majesty with an air of ease and grandeur united; and Peter used frequently to express his admiration at the propriety with which she supported her high station, without forgetting that she was not born to that dignity.

The following anecdotes will prove that she bore her elevation meekly; and, as Gordon asserts, was never forgetful of her former condition. When Wurmb, who had been tutor to Gluck's children at the

Catherine the time that Catherine was a domestic in that clergyman's family, presented himself before her after her marriage with Peter had been publicly solemnized, she recollected and addressed him with great complacency, "What, thou good man, art thou still alive! I will provide for thee." And she accordingly settled upon him a pension. She was no less attentive to the family of her benefactor Gluck, who died a prisoner at Moscow: she pensioned his widow; made his son a page; portioned the two eldest daughters; and advanced the youngest to be one of her maids of honour. If we may believe Weber, she frequently enquired after her first husband; and, when she lived with prince Menzikof, used secretly to send him small sums of money, until, in 1705, he was killed in a skirmish with the enemy.

But the most noble part of her character was her peculiar humanity and compassion for the unfortunate. Motraye has paid an handsome tribute to this excellence. "She had, in some sort, the government of all his (Peter's) passions; and even saved the lives of a great many more persons than Le Fort was able to do: she inspired him with that humanity, which, in the opinion of his subjects, nature seemed to have denied him. A word from her mouth in favour of a wretch, just going to be sacrificed to his anger, would disarm him; but if he was fully resolved to satisfy that passion, he would give orders for the execution when she was absent, for fear she should plead for the victim." In a word, to use the expression of the celebrated Munich, "*Elle étoit proprement la médiatrice entre le monarque et ses sujets.*"

CATHERINE (*Order of St*), in modern history, belongs to ladies of the first quality in the Russian court. It was instituted in 1714 by Catherine wife of Peter the Great, in memory of his signal escape from the Turks in 1711. The emblems of this order are a red cross, supported by a figure of St Catherine, and fastened to a scarlet string edged with silver, on which are inscribed the name of St Catherine, and the motto, *Pro fide et patria*.

CATHERLOUGH, a town of Ireland, in the county of Catherlough, and province of Leinster; seated on the river Barrow, 16 miles N. E. of Kilkenny. W. Long. 7. 1. N. Lat. 52. 45.

CATHERLOUGH, a county of Ireland, about 28 miles in length, and eight in breadth; bounded on the east by Wicklow and Wexford, on the west by Queen's-county, on the north by Kildare, and on the south and south-west by Wexford. It contains 5600 houses, 42 parishes, five baronies or boroughs, and sends six members to parliament, viz. two for the county, two for Catherlough, and two for Old Leighlin.

CATHETER, in surgery, a fistulous instrument, usually made of silver, to be introduced into the bladder, in order to search for the stone, or discharge the urine when suppressed. See **SURGERY**.

CATHETUS, in geometry, a line or radius falling perpendicularly on another line or surface; thus the catheti of a right-angled triangle, are the two sides that include the right angle.

CATHETUS of Incidence, in catoptrics, a right line drawn from a point of the object, perpendicular to the reflecting line.

CATHETUS of Reflexion, or *of the Eye*, a right line

drawn from the eye perpendicular to the reflecting plane.

CATHETUS of Obliquation, a right line drawn perpendicular to the speculum, in the point of incidence or reflexion.

CATHETUS, in architecture, a perpendicular line, supposed to pass through the middle of a cylindrical body, as a balluster, column, &c.

CATHNESS. See **CAITHNESS**.

CATHOLIC, in a general sense, denotes any thing that is universal or general.

CATHOLIC Church. The rise of heresies induced the primitive Christian church to assume to itself the appellation of *catholic*, being a characteristic to distinguish itself from all sects, who, though they had party names, sometimes sheltered themselves under the name of Christians.

The Romish church distinguishes itself now by the name of *catholic*, in opposition to all those who have separated from her communion, and whom she considers as heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no catholic church in being, that is, no universal Christian communion.

CATHOLIC King, is a title which has been long hereditary to the king of Spain. Mariana pretends, that Reccarede first received this title after he had destroyed Arianism in his kingdom, and that it is found in the council of Toledo for the year 589. Vascè ascribes the origin of it to Alphonsus in 738. Some allege that it has been used only since the time of Ferdinand and Isabella. Colombiere says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend it had been borne by their predecessors the Visigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Isabella. Others say, that Philip de Valois first bore the title; which was given him after his death by the ecclesiastics, on account of his favouring their interests.

In some epistles of the ancient popes, the title *catholic* is given to the kings of France and of Jerusalem, as well as to several patriarchs and primates.

CATHOLICON, in pharmacy, a kind of soft purgative electuary, so called, as being supposed an universal purger of all humours.

CATILINE (Lucius), a Roman of a noble family, who having spent his whole fortune in debauchery, formed the design of oppressing his country, destroying the senate, seizing the public treasury, setting Rome on fire, and usurping a sovereign power over his fellow-citizens. In order to succeed in this design, he drew some young noblemen into his plot; whom he prevailed upon, it is said, to drink human blood as a pledge of their union. His conspiracy, however, was discovered by the vigilance of Cicero, who was then consul. Upon which, retiring from Rome, he put himself at the head of an army, with several of the conspirators, and fought with incredible valour against Petreius, lieutenant to Anthony, who was colleague with Cicero in the consulship; but was defeated and killed in battle. See (*History of*) **ROME**.—Sallust has given an excellent history of this conspiracy.

CATO (Marcus Portius), the Censor, one of the greatest men among the ancients, was born at Tusculum in the year of Rome 519, about the 232d before Christ.

Cathetus
||
Cato.

Cato.

Christ. He began to bear arms at 17; and, on all occasions, showed extraordinary courage. He was a man of great sobriety, and reckoned no bodily exercise unworthy of him. He had but one horse for himself and his baggage, and he looked after and dressed it himself. At his return from his campaigns, he betook himself to plough his ground; not that he was without slaves to do it, but it was his inclination. He dressed also like his slaves, sat down at the same table with them, and partook of the same fare. He did not in the mean while neglect to cultivate his mind, especially in regard to the art of speaking; and he employed his talents, which were very great, in generously pleading causes in the neighbouring cities without fee or reward. Valerius Flaccus, who had a country-seat near Cato, conceiving an esteem for him, persuaded him to come to Rome; where Cato, by his own merit, and the influence of so powerful a patron, was soon taken notice of, and promoted. He was first of all elected tribune of the soldiers for the province of Sicily. He was next made questor in Africa under Scipio. Having in this last office reproved him for his profuseness to his soldiers, the general answered, that "he did not want so exact a questor, but would make war at what expence he pleased; nor was he to give an account to the Roman people of the money he spent, but of his enterprizes, and the execution of them." Cato, provoked at this answer, left Sicily, and returned to Rome.

Afterwards Cato was made prætor, when he fulfilled the duties of his office with the strictest justice. He conquered Sardinia, governed with admirable moderation, and was created consul. Being tribune in the war of Syria, he gave distinguished proofs of his valour against Antiochus the Great; and at his return stood candidate for the office of censor. But the nobles, who not only envied him as a *new* man, but dreaded his severity, set up against him seven powerful competitors. Valerius Flaccus, who had introduced him into public life, and had been his colleague in the consulship, was a ninth candidate, and these two united their interests. On this occasion Cato, far from employing soft words to the people, or giving hopes of gentleness or complaisance in the execution of his office, loudly declared from the rostra, with a threatening look and voice, "That the times required firm and vigorous magistrates to put a stop to that growing luxury which menaced the republic with ruin; censors who would cut up the evil by the roots, and restore the rigour of ancient discipline." It is to the honour of the people of Rome, that, notwithstanding these terrible intimations, they preferred him to all his competitors, who courted them by promises of a mild and easy administration: the comitia also appointed his friend Valerius to be his colleague, without whom he had declared that he could not hope to compass the reformation he had in view. Cato's merit, upon the whole, was superior to that of any of the great men who stood against him. He was temperate, brave, and indefatigable; frugal of the public money, and not to be corrupted. There is scarce any talent requisite for public or private life which he had not received from nature, or acquired by industry. He was a great soldier, an able statesman, an eloquent orator, a learned historian, and very knowing in rural affairs. Yet, with

Nº 67.

Cato.

all these accomplishments, he had very great faults. His ambition being poisoned with envy, disturbed both his own peace and that of the whole city as long as he lived. Though he would not take bribes, he was unmerciful and unconscionable in amassing wealth by all such means as the law did not punish.

The first act of Cato in his new office, was naming his colleague to be prince of the senate: after which the censors struck out of the list of the senators the names of seven persons; among whom was Lucius the brother of T. Flaminius. Lucius, when consul, and commanding in Gaul, had with his own hand murdered a Boian of distinction, a deserter to the Romans; and he had committed this murder purely to gratify the curiosity of his pathic, a young Carthaginian, who longing to see some body die a violent death, had reproached the general for bringing him away from Rome just when there was going to be a fight of gladiators. Titus Flaminius, full of indignation at the dishonour done to his brother, brought the affair before the people; and insisted upon Cato's giving the reason of his proceeding. The censor related the story; and when Lucius denied the fact, put him to his oath. The accused, refusing to swear, was deemed guilty; and Cato's censure was approved. But no part of the censor's conduct seemed so cruel to the nobles and their wives as the taxes he laid upon luxury in all its branches; dress, household furniture, women's toilets, chariots, slaves, and equipage. These articles were all taxed at three *per cent.* of the real value. The people, however, in general, were pleased with his regulations; insomuch that they ordered a statue to be erected to his honour in the temple of *Health*, with an inscription that mentioned nothing of his victories or triumph, but imported only that by his wise ordinances in his censorship he had reformed the manners of the republic. Plutarch relates, that before this, upon some of Cato's friends expressing their surprise, that while many persons without merit or reputation had statues, he had none; he answered, "I had much rather it should be asked why the people have not erected a statue to Cato, than why they have." Cato was the occasion of the third Punic war. Being dispatched to Africa to terminate a difference between the Carthaginians and the king of Numidia, on his return to Rome he reported, that Carthage was grown excessively rich and populous, and he warmly exhorted the senate to destroy a city and republic, during the existence of which, Rome could never be safe. Having brought from Africa some very large figs, he showed them to the conscript fathers in one of the lapets of his gown. "The country (says he) where this fine fruit grows, is but a three days voyage from Rome." We are told, that from this time he never spoke in the senate upon any subject, without concluding with these words, "I am also of opinion, that Carthage ought to be destroyed." He judged, that, for a people debauched by prosperity, nothing was more to be feared than a rival state, always powerful, and now from its misfortunes grown wise and circumspect. He held it necessary to remove all dangers that could be apprehended from *without*, when the republic had *within* so many distempers threatening her destruction.

From the censor dignified and severe, the reader will

Cato. will not perhaps be displeased to turn his view upon Cato sociable and relaxed. For we should have a false notion of him, if we imagined that nothing but a sad austerity prevailed in his speech and behaviour. On the contrary, he was extremely free; and often with his friends at table intermixed the conversation with lively discourses and witty sayings. Of these Plutarch has collected a pretty large number; we shall relate but one, and make use of Balzac's paraphrase, and the preface with which he introduces it. "The very censors, though sadness seemed to be one of the functions of their office, did not altogether lay aside railery. They were not always bent upon severity; and the first Cato, that troublesome and intolerable honest man, ceased sometimes to be troublesome and intolerable. He had some glimpses of mirth, and some intervals of good humour. He dropped now and then some words that were not unpleasant, and you may judge of the rest by this. He had married a very handsome wife; and history tells us that she was extremely afraid of the thunder, and loved her husband well. These two passions prompted her to the same thing; she always pitched upon her husband as a sanctuary against thunder, and threw herself into his arms at the first noise she fancied she heard in the sky. Cato, who was well pleased with the storm, and very willing to be caressed, could not conceal his joy. He revealed that domestic secret to his friends; and told them one day, speaking of his wife, "that she had found out a way to make him love bad weather; and that he never was so happy as when Jupiter was angry." It is worth observing, that this was during his censorship; when he degraded the senator Manlius, who would probably have been consul the year after, only for giving a kiss to his wife in the day-time, and in the presence of his daughter.

Cato died in the year of Rome 604, aged 85. He wrote several works. 1. A Roman History. 2. Concerning the art of war. 3. Of rhetoric. 4. A treatise of husbandry. Of these, the last only is extant.

CATO (Marcus Portius), commonly called Cato *Minor*, or Cato of *Utica*, was great grandson of Cato *the Censor*. It is said, that from his infancy he discovered by his speech, by his countenance, and even his childish sports and recreations, an inflexibility of mind; for he would force himself to go through with whatever he had undertaken, though the task was ill suited to his strength. He was rough towards those that flattered him, and quite intractable when threatened; was rarely seen to laugh, or even to smile; was not easily provoked to anger; but if once incensed, hard to be pacified. Sylla having had a friendship for the father of Cato, sent often for him and his brother, and talked familiarly with them. Cato, who was then about 14 years of age, seeing the heads of great men brought there, and observing the sighs of those that were present, asked his preceptor, "Why does no body kill this man?" Because, said the other, he is more feared than he is hated. The boy replied, Why then did you not give me a sword when you brought me hither, that I might have stabbed him, and freed my country from this slavery?

He learned the principles of the Stoic philosophy, which so well suited his character, under Antipater of Tyre, and applied himself diligently to the study of

it. Eloquence he likewise studied, as a necessary means to defend the cause of justice, and he made a very considerable proficiency in that science. To increase his bodily strength, he inured himself to suffer the extremes of heat and cold; and used to make journeys on foot, and bare-headed in all seasons. When he was sick, patience and abstinence were his only remedies: he shut himself up, and would see no body till he was well. Though remarkably sober in the beginning of his life, making it a rule to drink but once after supper, and then retire, he insensibly contracted a habit of drinking more freely, and of sitting at table till morning. His friends endeavoured to excuse this, by saying that the affairs of the public engrossed his attention all the day; and that, being ambitious of knowledge, he passed the night in the conversation of philosophers. Cæsar wrote that Cato was once found dead drunk at the corner of a street, early in the morning, by a great number of people who were going to the levee of some great man; and that when, by uncovering his face, they perceived who it was, they blushed for shame: "You would have thought (added Cæsar), that Cato had found them drunk, not they him." Pliny observes, that by this reflection Cæsar praises his enemy at the same time that he blames him. And Seneca, his extravagant panegyrist, ventures to assert, that it is easier to prove drunkenness to be a virtue, than Cato to be vicious. He affected singularity, and, in things indifferent, to act directly contrary to the taste and fashions of the age. Magnanimity and constancy are generally ascribed to him; and Seneca would fain make that haughtiness and contempt for others which, in Cato, accompanied those virtues, a matter of praise. Cato, says Seneca, having received a blow in the face, neither took revenge nor was angry; he did not even *pardon the affront*, but *denied that he had received it*. His virtue raised him so high, that injury could not reach him. He is reputed to have been chaste in his youth. His first love was Lepida; but when the marriage was upon the point of being concluded, Metellus Scipio, to whom she had been promised, interfered, and the preference was given to him. This affront extremely exasperated our Stoic. He was for going to law with Scipio; and when his friends had diverted him from that design, by showing him the ridicule of it, he revenged himself by making verses upon his rival. When this first flame subsided, he married Attilia the daughter of Serranus, had two children by her, and afterwards divorced her for her very indiscreet conduct.

He served as a volunteer under Gallius in the war of Spartacus; and when military rewards were offered him by the commander, he refused them, because he thought he had no right to them. Some years after, he went a legionary tribune into Macedonia under the prætor Rubrius: in which station he appeared, in his dress, and during a march, more like a private soldier than an officer: but the dignity of his manners, the elevation of his sentiments, and the superiority of his views, set him far above those who bore the titles of generals and proconsuls. It is said, that Cato's design in all his behaviour was to engage the soldiers to the love of virtue; whose affections he engaged thereby to himself, without his having that in his intention. "For the sincere love of virtue, (adds Plutarch), im-

Cato.

Cato.

plies an affection for the virtuous. Those who praise the worthy without loving them, pay homage to their glory; but are neither admirers nor imitators of their virtues." When the time of his service expired, and he was leaving the army, the soldiers were all in tears; so effectually had he gained their hearts by his condescending manners, and sharing in their labours. After his return home, he was chosen to the questorship; and had scarce entered on his charge, when he made a great reformation in the questor's office, and particularly with regard to the registers. These registers, whose places were for life, and through whose hands passed incessantly all the public accounts, being to act under young magistrates unexperienced in business, assumed an air of importance; and, instead of asking orders from the questors, pretended to direct and govern as if they themselves were the questors. Cato reduced them to their proper sphere.

One thing by which Cato extremely pleased the people, was his making the assassins to whom Sylla had given considerable rewards out of the treasury, for murdering the proscribed, disgorge their gains. Plutarch tells us, that Cato was so exact in discharging the duties of a senator, as to be always the first who came to the house, and the last who left it; and that he never quitted Rome during those days when the senate was to sit. Nor did he fail to be present at every assembly of the people, that he might awe those who, by an ill-judged facility, bestowed the public money in largesses, and frequently, through mere favour, granted remission of debts due to the state. At first his austerity and stiffness displeased his colleagues; but afterwards they were glad to have his name to oppose to all the unjust solicitations, against which they would have found it difficult to defend themselves. Cato very readily took upon him the task of refusing.

Cato, to keep out a very bad man, put in for the tribunate. He sided with Cicero against Catiline, and opposed Cæsar on that occasion. His enemies sent him to recover Cyprus, which Ptolemy had forfeited, thinking to hurt his reputation by so difficult an undertaking; yet none could find fault with his conduct.

Cato laboured to bring about an agreement between Cæsar and Pompey; but seeing it in vain, he sided with the latter. When Pompey was slain, he fled to Utica; and being pursued by Cæsar, advised his friends to be gone, and throw themselves on Cæsar's clemency. His son, however, remained with him; and Statilius, a young man, remarkable for his hatred to Cæsar.

The evening before the execution of the purpose he had formed with regard to himself, after bathing, he supped with his friends and the magistrates of the city. They sat late at table, and the conversation was lively. The discourse falling upon this maxim of the Stoics, that "the wise man alone is free, and that the vicious are slaves;" Demetrius, who was a Peripatetic, undertook to confute it from the maxims of his school. Cato, in answer, treated the matter very amply; and with so much earnestness and vehemence of voice, that he betrayed himself, and confirmed the suspicions of his friends, that he designed to kill himself. When he had done speaking, a melancholy silence en-

Cato.

sued; and Cato perceiving it, turned the discourse to the present situation of affairs, expressing his concern for those who had been obliged to put to sea, as well as for those who had determined to make their escape by land, and had a dry and sandy desert to pass. After supper, the company being dismissed, he walked for some time with a few friends, and gave his orders to the officers of the guard: and going into his chamber, he embraced his son and his friends with more than usual tenderness, which farther confirmed the suspicions of the resolution he had taken. Then laying himself down on his bed, he took up Plato's Dialogue on the immortality of the Soul. Having read for some time, he looked up, and missing his sword, which his son had removed while he was at supper, he called a slave, and asked who had taken it away; and receiving no pertinent answer, he resumed his reading. Some time after, he asked again for his sword; and, without showing any impatience, ordered it to be brought to him: but, having read out the book, and finding nobody had brought him his sword, he called for all his servants, fell into a rage, and struck one of them on the mouth with so much violence, that he very much hurt his own hand, crying out in a passionate manner, "What! do my own son and family conspire to betray me, and deliver me up naked and unarmed to the enemy?" Immediately his son and friends rushed into the room; and began to lament, and to beseech him to change his resolution. Cato raising himself, and looking fiercely at them, "How long is it," said he, "since I have lost my senses, and my son is become my keeper? Brave and generous son, why do you not bind your father's hands, that when Cæsar comes, he may find me unable to defend myself? Do you imagine that without a sword I cannot end my life? Cannot I destroy myself by holding my breath for some moments, or by striking my head against the wall?" His son answered with his tears, and retired. Apollonides and Demetrius remained with him, and to them he addressed himself in the following words: "Is it to watch over me that ye sit silent here? Do you pretend to force a man of my years to live? or can you bring any reason to prove, that it is not base and unworthy of Cato to beg his safety of an enemy? or why do you not persuade me to unlearn what I have been taught, that, rejecting all the opinions I have hitherto defended, I may now, by Cæsar's means, grow wiser, and be yet more obliged to him than for life alone? Not that I have determined any thing concerning myself; but I would have it in my power to perform what I shall think fit to resolve upon: and I shall not fail to ask your counsel, when I have occasion to act up to the principles which your philosophy teaches. Go tell my son, that he should not compel his father to what he cannot persuade him." They withdrew, and the sword was brought by a young slave. Cato drew it, and finding the point to be sharp; "Now," (said he), "I am my own master." And, laying it down, he took up his book again, which, it is reported, he read twice over. After this he slept so soundly that he was heard to snore by those who were near him. About midnight he called two of his freedmen, Cleanthes his physician, and Butas whom he chiefly employed in the management of his affairs. The last he sent to the port, to see whether all the

Romans

Romans were gone; to the physician he gave his hand to be dressed, which was swelled by the blow he had given his slave. This being an intimation that he intended to live, gave great joy to his family. Butas soon returned, and brought word that they were all gone except Crassus, who had staid upon some business, but was just ready to depart. He added, that the wind was high, and the sea rough. These words drew a sigh from Cato. He sent Butas again to the port, to know whether there might not be some one, who, in the hurry of embarkation, had forgot some necessary provisions, and had been obliged to put back to Utica. It was now break of day, and Cato slept yet a little more, till Butas returned to tell him, that all was perfectly quiet. He then ordered him to shut his door; and he flung himself upon his bed, as if he meant to finish his night's rest; but immediately he took his sword, and stabbed himself a little below his chest; yet not being able to use his hand so well by reason of the swelling, the blow did not kill him. It threw him into a convulsion, in which he fell from his bed, and overturned a table near it. The noise gave

the alarm; and his son, and the rest of the family, entering the room, found him weltering in his blood, and his bowels half out of his body. The surgeon, upon examination, found that his bowels were not cut; and was preparing to replace them, and bind up the wound, when Cato, recovering his senses, thrust the surgeon from him, and, tearing out his bowels, immediately expired, in the 48th year of his age.

By this rash act, independent of all moral or religious considerations, he carried his patriotism to the highest degree of political frenzy: for Cato, dead, could be of no use to his country; but had he preserved his life, his counsel might have moderated Cæsar's ambition, and (as Montesquieu observes) have given a different turn to public affairs.

CATOCHE, or CATOCHUS, a disease, by which the patient is rendered in an instant as immoveable as a statue, without either sense or motion, and continues in the same posture he was in at the moment of his being seized. See (the *Index* subjoined to) MEDICINE.

CATOPTRICALS.

CATOPTRICALS is that part of optics which explains the properties of reflected light, and particularly that which is reflected from mirrors.

As this and the other branches of OPTICS are fully treated under the collective word, we shall, in the present article, 1st, Just give a summary of the principles of the branch, in a few plain aphorisms, with some preliminary definitions; and, 2^{dly}, Insert a set of entertaining experiments founded upon them.

SECT. I. Definitions.

^T Definitions. 1. Every polished body that reflects the rays of light is called a mirror, whether its surface be plane, spherical, conical, cylindric, or of any other form whatever.

^{Plate} CXXVIII. 2. Of mirrors there are three principally used in optical experiments: The plane mirror, GHI, (fig. 1.); the spherical convex mirror, GHI, (fig. 2.); and the spherical concave mirror, GHI, (fig. 3.)

3. The point K, (fig. 2, 3.) round which the reflecting surface of a spherical mirror is described, is called its centre. The line KH, drawn from its centre perpendicular to its two surfaces, is the axis of the mirror; and the point H, to which that line is drawn, is its vortex.

4. The distance between the lines AG and BG, (fig. 1.) is called the angle of incidence, and the distance between BG and CG is the angle of reflection.

SECT. II. Aphorisms.

² 1. In a plain mirror. 1. The image DF, (fig. 1.) will appear as far behind the mirror, as the object AC is before it.

2. The image will appear of the same size, and in the same position as the object.

3. Every such mirror will reflect the image of an object of twice its own length and breadth.

4. If the object be an opaque body, and its rays fall

on the mirror nearly in direct lines, there will be only one image visible, which will be reflected by the inner surface of the glass. But,

5. If the object be a luminous body, and its rays fall very obliquely on the mirror, there will appear, to an eye placed in a proper position, several images; the first of which, reflected from the outer surface of the glass, will not be so bright as the second, reflected from the inner surface. The following images, that are produced by the repeated reflections of the rays between the two surfaces of the glass, will be in proportion less vivid, to the eighth or tenth, which will be scarce visible.

1. The image DF, (fig. 2.) will always appear behind it.

2. The image will be in the same position as the object.

3. It will be less than the object.

4. It will be curved, but not, as the mirror, spherical.

5. Parallel rays falling on this mirror will have the focus or image at half the distance of the centre K, from the mirror.

6. In converging rays, the distance of the object must be equal to half the distance of the centre, to make the image appear behind the mirror.

7. Diverging rays will have their image at less than half the distance of the centre. If the object be placed in the centre of the mirror, its image will appear at one-eighth of that distance behind it.

1. That point where the image appears of the same dimensions as the object, is the centre of that mirror.

2. Parallel rays will have their focus at one half the distance of the centre.

3. Converging rays will form an image before the mirror.

4. In diverging rays, if the object be at less than one half the distance of the centre, the image will be behind the mirror, erect, curved, and magnified, as

K k 2

DEF,

³ II. In a spherical convex mirror.

⁴ III. In a spherical concave mirror.

DEF, (fig. 3.) but if the distance of the object be greater, the image will be before the mirror, inverted and diminished, as DEF, (fig. 4.)

5. The sun's rays falling on a concave mirror, and being parallel, will be collected in a focus at half the distance of its centre, where their heat will be augmented in proportion of the surface of the mirror to that of the focal spot.

6. If a luminous body be placed in the focus of a concave mirror, its rays being reflected in parallel lines will strongly enlighten a space of the same dimension with the mirror, at a great distance. If the luminous object be placed nearer than the focus, its rays will diverge, and consequently enlighten a larger space. It is on this principle that reverberators are constructed.

IV. In all plane and spherical mirrors the angle of incidence is equal to the angle of reflection.

SECT. III. *Entertaining Experiments.*

5.
I. Catop-
tical illu-
sions.

I. Of all our senses the sight is certainly subject to the greatest illusion. The various writers on optics have described a great number of instances in which it deceives us, and have constantly endeavoured to investigate the causes, to explain their effects, and to reconcile appearance with reality. We every day discover new phenomena, and doubtless many more are reserved for posterity. It frequently happens, moreover, that a discovery which at first seemed of little consequence, has led to matters of the highest importance.

Take a glass bottle A (fig. 14.) and fill it with water to the point B; leave the upper part BC empty, and cork it in the common manner. Place this bottle opposite a concave mirror, and beyond its focus, that it may appear reversed, and before the mirror (see sect. ii. aphor. 4. of a spher. concave mirror,) place yourself still further distant from the bottle, and it will appear to you in the situation, *a, b, c*, (fig. 15.)

Now it is remarkable in this apparent bottle, that the water, which, according to all the laws of catoptrics, and all the experiments made on other objects, should appear at *a b*, appears on the contrary at *b c*, and consequently the part *a b* appears empty.

If the bottle be inverted and placed before the mirror (as in fig. 16.), its image will appear in its natural, erect position; and the water, which is in reality at BC, will appear at *a b*.

If while the bottle is inverted it be uncorked, and the water run gently out, it will appear, that while the part BC is emptying, that of *a b* in the image is filling; and what is likewise very remarkable, as soon as the bottle is empty the illusion ceases, the image also appearing entirely empty. If the bottle likewise be quite full there is no illusion.

If while the bottle is held inverted, and partly empty, some drops of water fall from the bottom A towards BC, it seems in the image as if there were formed at the bottom of the part *a b*, bubbles of air that rose from *a* to *b*; which is the part that seems full of water. All these phenomena constantly appear.

The remarkable circumstances in this experiment, are, first, not only to see an object where it is not, but also where its image is not; and secondly, that of two

objects which are really in the same place, as the surface of the bottle and the water it contains, the one is seen at one place, and the other at another; and to see the bottle in the place of its image, and the water where neither it nor its image are.

II. Construct a box AB, of about a foot long, eight inches wide, and six high; or what other dimension you shall think fit, provided it does not greatly vary from these proportions.

On the inside of this box, and against each of its opposite ends A and B, place a mirror of the same size. Take off the quicksilver from the mirror that you place at B, for about an inch and an half, at the part C, where you are to make a hole in the box of the same size, by which you may easily view its inside. Cover the top of the box with a frame, in which must be placed a transparent glass, covered with gauze, on the side next the inner part of the box. Let there be two grooves at the parts E and F to receive the two painted scenes hereafter mentioned. On two pieces of cut pasteboard let there be skilfully painted on both sides (see fig. 6. and 7.) any subject you think proper; as woods, gardens, bowers, colonades, &c. and on two other pasteboards, the same subjects on one side only; observing that there ought to be on one of them some object relative to the subject placed at A, that the mirror placed at D may not reflect the hole at C on the opposite side.

Place the two boards painted on both sides in the grooves E and F; and those that are painted on one side only, against the opposite mirrors C and D; and then cover the box with its transparent top. This box should be placed in a strong light to have a good effect.

When the eye is placed at C, and views the objects on the inside of the box, of which some, as we have said, are painted on both sides, they are successively reflected from one mirror to the other; and if, for example, the painting consists of trees, they will appear like a very long vista, of which the eye cannot discern the end: for each of the mirrors repeating the objects, continually more faintly, contribute greatly to augment the illusion.

III. Take a square box ABCD, of about six inches long, and twelve high; cover the inside of it with four plane mirrors, which must be placed perpendicular to the bottom of the box CHFD.

Place certain objects in relief on the bottom of this box; suppose, for example, a piece of fortification, (as fig. 9.) with tents, soldiers, &c. or any other subject that you judge will produce an agreeable effect by its disposition when repeatedly reflected by the mirrors.

On the top of this box place a frame of glass, in form of the bottom part of a pyramid, whose base AGEB is equal to the size of the box: its top ILN, must form a square of six inches, and should not be more than four or five inches higher than the box. Cover the four sides of this frame with a gauze, that the inside may not be visible but at the top ILN, which should be covered with a transparent glass.

When you look into this box through the glass ILN, the mirrors that are diametrically opposite each other, mutually reflecting the figures inclosed, the eye beholds a boundless extent, completely covered with these

6
II. Appearance of a boundless vista.
fig. 5.

7
III. Of a fortification of immense extent,
fig. 8.

these objects; and if they are properly disposed, the illusion will occasion no small surprize, and afford great entertainment.

Note, The nearer the opening ILN is to the top of the box, the greater will be the apparent extent of the subject. The same will happen if the four mirrors placed on the sides of the box be more elevated. The objects, by either of these dispositions will appear to be repeated nine, twenty-five, forty-nine times, &c. by taking always the square of the odd numbers of the arithmetical progression 3, 5, 7, 9, &c. as is very easy to conceive, if we remember that the subject enclosed in the box is always in the centre of a square, composed of several others, equal to that which forms the bottom of the box.

Other pieces of the same kind (that is viewed from above) may be contrived, in which mirrors may be placed perpendicular on a triangular, pentagon, or hexagon, (that is, a three, five, or six-sided) plane. All these different dispositions, properly directed, as well with regard to the choice as position of the objects, will constantly produce very remarkable and pleasing illusions.

If instead of placing the mirrors perpendicular, they were to incline equally, so as to form part of a reversed pyramid, the subject placed in the box would then have the appearance of a very extensive globular or many-sided figure.

8
IV. Surprising multiplication of objects, fig. 10.
IV. On the hexagonal or six-sided plane ABCDEF draw six semi-diameters GA, GB, GC, GD, GE, GF; and on each of these place perpendicularly two plane mirrors, which must join exactly at the centre G, and which placed back to back must be as thin as possible. Decorate the exterior boundary of this piece (which is at the extremity of the angles of the hexagon) with six columns, that at the same time serve to support the mirrors, by grooves formed on their inner sides. (See the profile H). Add to these columns their entablatures, and cover the edifice in such manner as you shall think proper.

In each one of these six triangular spaces, contained between two mirrors, place little figures of pasteboard, in relief, representing such objects as when seen in an hexagonal form will produce an agreeable effect. To these add small figures of enamel; and take particular care to conceal, by some object that has relation to the subject, the place where the mirrors join, which, as we have said before, all meet in the common centre G.

When you look into any one of the six openings of this palace, the objects there contained being repeated six times, will seem entirely to fill up the whole of the building. This illusion will appear very remarkable; especially if the objects made choice of are properly adapted to the effect that is to be produced by the mirrors.

Note, if you place between two of these mirrors part of a fortification, as a curtain and two demi-

bastions, you will see an entire citadel, with its six bastions. Or if you place part of a ball-room, ornamented with chandeliers and figures in enamel, all those objects being here multiplied, will afford a very pleasing prospect.

V. Within the case ABCD, place four mirrors, O, P, Q, R, so disposed that they may each of them make an angle of forty-five degrees, that is, that they may be half way inclined from the perpendicular, as in the figure. In each of the two extremities AB, make a circular overture, in one of which fix the tube GL, in the other the tube MF, and observe that in each of these is to be inserted another tube, as H and I (A).
9
V. Opaque bodies seemingly rendered transparent, fig. 11.

Furnish the first of these tubes with an object-glass at G, and a concave eye-glass at F. You are to observe, that in regulating the focus of these glasses, with regard to the length of the tube, you are to suppose it equal to the line G, or visual pointed ray, which entering at the overture G, is reflected by the four mirrors, and goes out at the other overture F, where the ocular glass is placed. Put any glass you will into the two ends of the moveable tubes H and I; and lastly place the machine on a stand E, moveable at the point S, that it may be elevated or depressed at pleasure.

When the eye is placed at F, and you look through the tube, the rays of light that proceed from the object T, passing through the glass G, are successively reflected by the mirrors, O, P, Q, and R, to the eye at F, and there paint the object T, in its proper situation, and these rays appear to proceed directly from that object.

The two moveable tubes H and I, at the extremities of each of which a glass is placed, serve only the more to disguise the illusion, for they have no communication with the interior part of the machine. This instrument being moveable on the stand E, may be directed to any object; and if furnished with proper glasses will answer the purpose of a common perspective.

The two moveable tubes H and I being brought together, the machine is directed toward any object, and desiring a person to look in at the end F, you ask him if he see distinctly that object. You then separate the two moveable tubes, and leaving a space between them sufficient to place your hand, or any other solid body, you tell him that the machine has the power of making objects visible through the most opaque body; and as a proof you desire him then to look at the same object, when, to his great surprize, he will see it as distinct as when there was no solid body placed between the tubes.

Note, This experiment is the more extraordinary, as it is very difficult to conceive how the effect is produced. The two arms of the case appearing to be made to support the perspective glass; and to whatever object it is directed, the effect is still the same.

VI.

(A) These four tubes must terminate in the substance of the case, and not enter the inside, that they may not hinder the effect of the mirrors. The fourfold reflection of the rays of light from the mirrors, darkens in some degree the brightness of the object; some light is also lost by the magnifying power of the perspective: If, therefore, instead of the object-glass at G, and concave eye-glass at F, plain glasses were substituted; the magnifying power of the perspective will be taken away, and the object will appear brighter.

10
VI. VII The
magician's
mirrors,
fig. 12.

VI. In the partition AB, make two overtures, CD, and EF, of a foot high, and ten inches wide, and about a foot distant from each other. Let them be at the common height of a man's head; and in each of them place a transparent glass, surrounded with a frame, like a common mirror.

Behind this partition place two mirrors H and I, inclined to it in an angle of forty-five degrees: that is, half-way between a line drawn perpendicular to the ground and its surface: let them be both 18 inches square: let all the space between them be inclosed by boards or pasteboard painted black, and well closed, that no light may enter: let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other: so that if two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

Note, There should be a sconce with a candle placed on each side of the two glasses in the wainscot, to enlighten the faces of the persons who look in them, otherwise this experiment will have no remarkable effect.

This experiment may be considerably improved by placing the two glasses in the partition in adjoining rooms, and a number of persons being previously placed in one room, when a stranger enters the other, you may tell him his face is dirty; and desire him to look in the glass, which he will naturally do; and on seeing a strange face he will draw back: but returning to it, and seeing another, another, and another, like the phantom kings in Macbeth, what his surprize will be is more easy to conceive than express. After this, a real mirror may be privately let down on the back of the glass; and if he can be prevailed to look in it once more, he will then, to his further astonishment, see his own face; and may be told, perhaps persuaded, that all he thought he saw before was mere imagination.

How many tricks, less artful than this, have passed in former times for forcery; and pass at this time, in some countries, for apparitions?

Note, When a man looks in a mirror that is placed perpendicular to another, his face will appear entirely deformed. If the mirror be a little inclined, so as to make an angle of 80 degrees (that is, one-ninth parts from the perpendicular), he will then see all the parts of his face, except the nose and forehead. If it be inclined to 60 degrees (that is, one-third part), he will appear with three noses and six eyes: in short, the apparent deformity will vary at each degree of inclination; and when the glass comes to 45 degrees (that is, half way down), the face will vanish. If, instead of placing the two mirrors in this situation, they are so disposed that their junction may be vertical, their different inclinations will produce other effects; as the situation of the object relative to these mirrors is quite different. The effects of these mirrors, though remarkable enough, occasions but little surprize, as there is no method of concealing the cause by which they are produced.

Fig. 13.

VII. Make a box of wood, of a cubical figure, ABCD, of about 15 inches every way. Let it be

fixed on the pedestal P, at the usual height of a man's head. In each side of this box let there be an opening of an oval form, of ten inches high, and seven wide.

In this box place two mirrors A, D, with their backs against each other; let them cross the box in a diagonal line, and in a vertical position. Decorate the openings in the sides of this box with four oval frames and transparent glasses, and cover each of them with a curtain, so contrived that they may all draw up together.

Place four persons in front of the four sides, and at equal distances from the box, and then draw up the curtains that they may see themselves in the mirrors; when each of them, instead of his own figure, will see that of the person who is next him, and who, at the same time, will seem to him to be placed on the opposite side. Their confusion will be the greater, as it will be very difficult for them to discover the mirrors concealed in the box. The reason of this phenomenon is evident; for though the rays of light may be turned aside by a mirror, yet, as we have before said, they always appear to proceed in right lines.

VIII. Provide a box ABCD of about two feet long, 15 inches wide, and 12 inches high. At the end AC place a concave mirror, the focus of whose parallel rays is at 18 inches from the reflecting surface. At IL place a pasteboard blacked, in which a hole is cut sufficiently large to see on the mirror H the object placed at BEFD. 12
VIII. The
perspective
mirror,
fig. 17.

Cover the top of the box, from A to I, close, that the mirror H may be entirely darkened. The other part IB, must be covered with a glass, under which is placed a gauze.

Make an aperture at G, near the top of the side E B; beneath which, on the inside, place, in succession, paintings of different subjects, as vistas, landscapes, &c. so that they may be in front of the mirror H. Let the box be so placed that the object may be strongly illuminated by the sun, or by wax lights placed under the enclosed part of the box AI.

By this simple construction the objects placed at GD will be thrown into their natural perspective; and if the subjects be properly chosen, the appearance will be altogether as pleasing as in optical machines of a much more complicated form.

Note, A glass mirror should be always here used, as those of metal do not represent the objects with equal vivacity, and are beside subject to tarnish. It is also necessary that the box be sufficiently large, that you may not be obliged to use a mirror whose focus is too short; for in that case, the right lines near the border of the picture will appear bent in the mirror, which will have a disagreeable effect, and cannot be avoided.

IX. The rays of a luminous body placed in the focus of a concave mirror being reflected in parallel lines, if a second mirror be placed diametrically opposite the first, it will, by collecting those rays in its focus, set fire to a combustible body. 13
IX. To set
fire to a
combustible
body by the
reflection of
two concave
mirrors,
Fig. 18.

Place two concave mirrors, A and B, at about 12 or 15 feet distance from each other, and let the axis of each of them be in the same line. In the focus C of one of them, place a live coal, and in the focus D of the other, some gun-powder. With

a pair of double bellows, which make a continual blast, keep constantly blowing the coal, and notwithstanding the distance between them, the powder will presently take fire.

It is not necessary that these mirrors be of metal or brass, those made of wood or pasteboard, gilded, will produce the explosion, which has sometimes taken effect at the distance of 50 feet, when mirrors of 18 inches, or two feet diameter, have been used.

This experiment succeeds with more difficulty at great distances; which may proceed from the moisture in a large quantity of air. It would doubtless take effect more readily, if a tin tube, of an equal diameter with the mirrors, were to be placed between them.

¹⁴
The real ap-
partition,
fig. 19.
X. Behind the partition AB, place, in a position something oblique, the concave mirror EF, which must be at least ten inches in diameter, and its distance from the partition equal to three-fourths of the distance of its centre.

In the partition make an opening of seven or eight inches, either square or circular: it must face the mirror, and be of the same height with it. Behind this partition place a strong light, so disposed that it may not be seen at the opening, and may illumine an object placed at C, without throwing any light on the mirror.

Beneath the aperture in the partition place the object C, that you intend shall appear on the outside of the partition, in an inverted position; and which we will suppose to be a flower. Before the partition, and beneath the aperture, place a little flower-pot D, the top of which should be even with the bottom of the aperture, that the eye, placed at G, may see the flower in the same position as if its stalk came out of the pot.

Take care to paint the space between the back part of the partition and the mirror black, to prevent any reflections of light from being thrown on the mirror; in a word, so dispose the whole that it may be as little enlightened as possible.

When a person is placed at the point G, he will perceive the flower that is behind the partition, at the top of the pot at D, but on putting out his hand to pluck it, he will find that he attempts to grasp a shadow.

If in the opening of the partition a large double convex lens of a short focus be placed, or, which is not quite so well, a bottle of clear water, the image of the flower reflected thereon will appear much more vivid and distinct.

Observation. The phenomena that may be produced by means of concave mirrors are highly curious and astonishing. By their aid, spectres of various kinds may be exhibited. Suppose, for example, a person with a drawn sword places himself before a large concave mirror, but farther from it than its focus; he will then see an inverted image of himself in the air, between him and the mirror, of a less size than himself. If he steadily present the sword towards the centre of the mirror, an image of the sword will come out therefrom towards

the sword in his hand, point to point, as it were to fence with him; and by his pushing the sword nearer, the image will appear to come nearer him, and almost to touch his breast, having a striking effect upon him. If the mirror be turned 45 degrees, or one eighth round, the reflected image will go out perpendicular to the direction of the sword presented, and apparently come to another person placed in the direction of the motion of the image. If that person is unacquainted with the experiment, and does not see the original sword, he will be much surprised and alarmed.—This experiment may be another way diversified, by telling any person, that at such an hour, and in such a place, he should see the apparition of an absent or deceased friend (of whose portrait you are in possession). In order to produce this phantom, instead of the hole in the partition AB in the last figure, there must be a door which opens into an apartment to which there is a considerable descent. Under that door you are to place the portrait, which must be inverted and strongly illuminated, that it may be lively reflected by the mirror, which must be large and well polished. Then having introduced the incredulous spectator at another door, and placed him in the proper point of view, you suddenly throw open the door at AB, when, to his great astonishment, he will immediately see the apparition of his friend.

It will be objected, perhaps, that this is not a perfect apparition, because it is only visible at one point of view, and by one person. But it should be remembered, that it was an established maxim in the last centuries, that a spectre might be visible to one person and not to others. So Shakespeare makes both Hamlet and Macbeth see apparitions that were not visible to others, present at the same time. It is not unlikely, moreover, that this maxim took its rise from certain apparitions of this kind that were raised by the monks, to serve some purposes they called religious; as they alone were in possession of what little learning there then was in the world.

Opticians sometimes grind a glass mirror concave in one direction only, as it is said longitudinally; it is in fact a concave portion of a cylinder, the breadth of which may be considered that of the mirror. A person looking at his face in this mirror, in the direction of its concavity, will see it curiously distorted in a very lengthened appearance; and by turning the cylindrical mirror a quarter round, his visage will appear distorted another way, by an apparent increase in width only. Another curious and singular property attends this sort of mirrors: If in a very near situation before it, you put your finger on the right-hand side of your nose, it will appear the same in the mirror; but if in a distant situation, somewhat beyond the centre of concavity, you again look at your face in the mirror, your finger will appear to be removed to the other or left-hand side of your nose. This, though something extraordinary, will in its cause appear very evident from a small consideration of the properties of spherical concave mirrors.

Catoptro-
mancy
||
Cattivel-
launi

CATOPTROMANCY, *κατοπτρομαντική*, a kind of divination among the ancients; so called, because consisting in the application of a mirror. The word is formed from *κατοπτρον*, *speculum*, "mirror," and *μαντήρα*, *divinatio*, "divination." Pausanias says, it was in use among the Achæians; where those who were sick, and in danger of death, let down a mirror, or looking-glass fastened by a thread, into a fountain before the temple of Ceres; then, looking in the glass, if they saw a ghastly disfigured face, they took it as a sure sign of death: on the contrary, if the flesh appeared fresh and healthy, it was a token of recovery. Sometimes glasses were used without water, and the images of things future represented in them. See **GASTROMANCY**.

CATROU (Francis), a famous Jesuit, born at Paris in 1659. He was engaged for 12 years in the *Journal de Trevoux*, and applied himself at the same time to other works, which distinguished him among the learned. He wrote a general History of the Mogul empire, and a Roman history, in which he was assisted by Father Rouille a brother Jesuit. Catrou died in 1737; and this last history was continued by Ronille, who died in 1740.

CATTERTHUN, a remarkable Caledonian post, a few miles north of the town of Brechin in the county of Angus in Scotland. Mr Pennant describes it as of uncommon strength. "It is (says he) of an oval form, made of a stupenduous dike of loose white stones, whose convexity, from the base within to that without, is 122 feet. On the outside a hollow, made by the disposition of the stones, surrounds the whole. Round the base is a deep ditch, and below that about 100 yards, are vestiges of another, that went round the hill. The area within the stony mound is flat; the axis, or length of the oval, is 436 feet, the transverse diameter 200. Near the east side is the foundation of a rectangular building; and on most parts are the foundations of others small and circular: all which had once their superstructures, the shelter of the possessors of the post: there is also a hollow, now almost filled with stones, the well of the place." There is another fortification, but of inferior strength, in the neighbourhood. It is called the *Brown Catterthun*, from the colour of the ramparts which are composed only of earth. It is of a circular form, and consists of various concentric dikes. On one side of this rises a small rill, which, running down the hill, has formed a deep gully. From the side of the fortress is another rampart, which extends parallel to the rill, and then reverts, forming an additional post or retreat. The meaning of the word *Catter-thun* is *Camp-town*; and Mr Pennant thinks these might probably be the posts occupied by the Caledonians before their engagement at the foot of the Grampian Mountains with the celebrated Agricola. See (*History of*) **SCOTLAND**.

CATTI, a people of Germany, very widely spread, on the east reaching to the river Sala, on the north to Westphalia; occupying, besides Hesse, the Wetterau, and part of the tract on the Rhine, and on the banks of the river Lohne. The Hercynian forest began and ended in their country.

CATTIVELLAUNI, anciently a people of Britain, seated in the country which is now divided into the counties of Hertford, Bedford, and Bucks. The

name of this ancient British people is written in several different ways by Greek and Roman authors, being sometimes called Catti, Cassii, Caticuclani, Cattidudani, Catticudani, &c. That they were of Belgic origin cannot be doubted, and it is not improbable, that they derived their name of Catti from the Belgic word *Katten*, which signifies illustrious or noble, and that the addition of *Vellauni*, which means on the banks of rivers, might be given them after their arrival in Britain, as descriptive of the situation of their country. However this may be, the *Cattivellauni* formed one of the most brave and warlike of the ancient British nations when Cæsar invaded Britain, and long after. Cassibelanus, their prince, was made commander in chief of the confederated Britons, not only on account of his own personal qualities, but also because he was at the head of one of their bravest and most powerful tribes. In the interval between the departure of Cæsar and the next invasion under Claudius, the *Cattivellauni* had reduced several of the neighbouring states under their obedience; and they again took the lead in the opposition to the Romans at their second invasion, under their brave but unfortunate prince Caracatus. The country of the *Cattivellauni* was much frequented and improved by the Romans, after it came under their obedience. Verulamium, their capital, which stood near where St Alban's now stands, became a place of great consideration, was honoured with the name and privileges of a municipium or free city, and had magistrates after the model of the city of Rome. This place was taken and almost destroyed by the insurgents under Boadicia; but it was afterwards rebuilt, restored to its former splendor, and surrounded with a strong wall, some vestiges of which are still remaining. *Durocbrivæ* and *Magiavintum*, in the second iter of Antoninus, were probably Dunstable and Fenny-Stratford, at which places there appear to have been Roman stations. The *Salenæ* of Ptolemy, a town in the country of the *Cattivellauni*, was perhaps situated at Salndy, in Bedfordshire, where several Roman antiquities have been found. There were, besides these, several other Roman forts, stations, and towns in this country, which it would be tedious to enumerate. The territories of the *Cattivellauni* made a part of the Roman province called *Britannia Prima*.

CATTLE, a collective word, which signifies the fourfooted animals, which serve either for tilling the ground, or for food to men. They are distinguished into large, or black cattle; and into small cattle: of the former are horses, bulls, oxen, cows, and even calves and heifers; amongst the latter are rams, ewes, sheep, lambs, goats, kids, &c. Cattle are the chief stock of a farm: they who deal in cattle are styled graziers.

CATULLUS (Cains Valerius), a Latin poet, born at Verona, in the year of Rome 666. The harmony of his numbers acquired him the esteem and friendship of Cicero, and other great men of his time. Many of his poems, however, abound with gross obscenities. He wrote satirical verses against Cæsar, under the name of *Marmoro*. He spent his whole life in a state of poverty; and died in the flower of his age, and the height of his reputation. Joseph Scaliger, Passerat, Muret, and Isaac Vossius, have written learned notes on this poet.

Catz
||
Cavalcante.

CATZ (James), a great civilian, politician, and Dutch poet, was born at Browerhaven, in Zealand, in the year 1577. After having made several voyages, he fixed at Middleburg; and acquired by his pleadings such reputation, that the city of Dort chose him for its pensionary; as did also, some time after, that of Middleburg. In 1634, he was nominated pensionary of Holland and West Friesland; and in 1648, he was elected keeper of the seal of the same state, and stadtholder of the siefs: but some time after, he resigned these employments, to enjoy the repose which his advanced age demanded. As the post of grand pensionary had been fatal to almost all those who had enjoyed it, from the beginning of the republic till that time, Catz delivered up his charge on his knees, before the whole assembly of the states, weeping for joy, and thanking God for having preserved him from the inconveniences that seemed attached to the duties of that office. But though he was resolved to spend the rest of his days in repose, the love of his country engaged him to comply with the desires of the state, who importuned him to go on an embassy to England, in the delicate conjuncture in which the republic found itself during the protectorate of Cromwell. At his return, he retired to his fine country seat at Sorgvliet, where he lived in tranquillity till the year 1660, in which he died. He wrote a great number of poems in Dutch; most of which are on moral subjects, and so esteemed, that they have been often printed in all the different sizes; and next to the Bible, there is no work so highly valued by the Dutch.

CATZENELLIBOGEN, a town of Germany, in the lower part of the upper circle of the Rhine, with a strong castle. It is capital of a county of the same name. E. Long. 7. 38. N. Lat. 50. 20.

CAVA, in anatomy, the name of a vein, the largest in the body, terminating in the right ventricle of the heart. See ANATOMY, p. 751. col. 2.

CAVA, a considerable and populous town of Italy, in the kingdom of Naples, and in the Hither Principato, with a bishop's see. It is situated at the foot of Mount Metelian, in E. Long. 15. 5. N. Lat. 40. 40.

CAVAILLAN, a town of France in Contal Venaissin, with a bishop's see. It is situated on the river Durance, in a fertile and pleasant country. E. Long. 4. 17. N. Lat. 43. 52.

CAVALCADE, a formal pompous march or procession of horsemen, equipages, &c. by way of parade, or ceremony, as a grace to a triumph, public entry, or the like.

CAVALCADOUR, or CAVALCADEUR, anciently denoted a riding-master; but at present is disused in that sense, and only employed to denote a sort of equerries or officers who have the direction of princes' stables. The French say, *ecuyer cavalcadeur* of the king, the duke of Orleans, &c. Menage writes it *cavalcadour*, and derives it from the Spanish *cavalgador*, a horseman.

CAVALCANTE (Guido), a nobleman of Florence in the 13th century, who having followed the party of the Guelfes, experienced the changeableness of fortune. He showed great strength of mind in his misfortunes, and never neglected to improve his talents. He wrote a treatise in Italian concerning style, and

Vol. IV. Part I.

some verses which are esteemed. His poem on the love of this world, has been commented on by several learned men.

CAVALIER, a horseman, or person mounted on horseback; especially if he be armed withal, and have a military appearance.

Anciently, the word was restrained to a knight, or *miles*. The French still use *Chevalier* in the same sense.

CAVALIER, considered as a faction. See BRITAIN, n° 109.

CAVALIER, in fortification, an elevation of earth of different shapes, situated ordinarily in the gorge of a bastion, bordered with a parapet, and cut into more or less embrasures, according to the capacity of the cavalier. Cavaliers are a double defence for the faces of the opposite bastion: they defend the ditch, break the besiegers' galleries, command the traverses in dry moats, scour the salient angle of the counterscarp, where the besiegers have their counter-batteries, and enfilade the enemies' trenches, or oblige them to multiply their parallels: they are likewise very serviceable in defending the breach and the retrenchments of the besieged, and can very much incommode the entrenchments which the enemy make, being lodged in the bastion.

CAVALIER, in the manege, one that understands horses, and is practised in the art of riding them.

CAVALIERI (Bonaventure), an eminent mathematician in the 17th century, a native of Milan, and a friar of the order of the Jesuits of St Jerome, was professor of mathematics at Bologna, where he published several mathematical books, particularly the *Method of Indivisibles*. He was a scholar of Galileo. His *Directorium generale Uranometricum* contains great variety of most useful practices in trigonometry and astronomy. His trigonometrical tables in that work are excellent.

CAVALRY, a body of soldiers that charge on horseback. The word comes from the French, *cavalerie*, and that from the corrupt Latin, *caballus*, a horse.

The Roman cavalry consisted wholly of those called *equites*, or knights, who were a distinct order in the distribution of citizens.—The Grecian cavalry were divided into *cataphractæ* and *non cataphractæ*, i. e. into heavy and light armed.—Of all the Greeks, the Thesalians excelled most in cavalry. The Lacedæmonians, inhabiting a mountainous country, were but meanly furnished with cavalry, till, carrying their arms into other countries, they found great occasion for horses to support and cover their foot. The Athenian cavalry, for a considerable time, consisted only of 96 horsemen: after expelling the Persians out of Greece, they increased the number to 300; and afterwards to 1200, which was the highest pitch of the Athenian cavalry. The Turkish cavalry consists partly of Spahis, and partly of horsemen raised and maintained by the Zaims and Timariots.

The chief use of the cavalry is to make frequent excursions to disturb the enemy, intercept his convoys, and destroy the country: in battle to support and cover the foot, and to break through and disorder the enemy; also to secure the retreat of the foot. Formerly, the manner of the fighting of the cavalry

L I

was

Cavalier
||
Cavalry.

Cavan
||
Caudex.

was, after firing their pistols or carabines, to wheel off, to give opportunity for loading again. Gustavus Adolphus is said to have first taught the cavalry to charge through, to march straight up to the enemy, with the sword drawn in the bridlehand, and each man having fired his piece, at the proper distance, to betake himself to his sword, and charge the enemy as was found most advantageous.

CAVAN, a town of Ireland, and capital of a county of the same name, in the province of Ulster, situated in W. Long. 7. 32. N. Lat. 5. 04.

CAVAN, a county of Ireland, 47 miles in length, and 23 in breadth; is bounded on the east by Monaghan, and on the south by Longford, West-Meath, and East-Meath. It has but two towns of any note, viz. Cavan and Kilmore. It sends five members to parliament; two for the county, two for Cavan, and one for Kilmore. It contains upwards of 8000 houses, 37 parishes, seven baronies, and two boroughs.

CAUCASUS, the name of a very high mountain of Asia, being one of that great ridge which runs between the Black and Caspian seas. Sir John Charindin describes this as the highest mountain, and the most difficult to pass, of any he had seen. It has frightful precipices, and in many places the roads are cut out of the solid rock. At the time he passed it, the mountain was entirely covered with snow; so that, in many places, his guides behoved to clear the way with shovels. The mountain is 36 leagues over, and the summit of it eight leagues in breadth. The top is perpetually covered with snow; and our traveller relates, that the two last days he seemed to be in the clouds, and was not able to see 20 paces before him. Excepting the very top, however, all the parts of Mount Caucasus are extremely fruitful; abounding in honey, corn, fruits, hogs, and large cattle. The vines twine about the trees, and rise so high, that the inhabitants cannot gather the fruit from the uppermost branches. There are many streams of excellent water, and a vast number of villages. The inhabitants are for the most part Christians of the Georgian Church. They have fine complexions, and the women are very beautiful.—In the winter they wear snow-shoes in the form of rackets, which prevent their sinking in the snow, and enable them to run upon it with great swiftness.

CAUDEBEC, a rich, populous, and trading town in Normandy, and capital of the territory of Caux. It is seated at the foot of a mountain near the river Seine, in E. Long. 0. 46. N. Lat. 40. 30.

CAUDEX, by Malpighi and other botanists, is used to signify the stem or trunk of a tree: by Linnæus, the stock or body of the root, part of which ascends, part descends. The ascending part raises itself gradually above ground, serving frequently for a trunk, and corresponds in some measure to the *caudex* of former writers: the descending part strikes gradually downward into the ground, and puts forth radicles or small fibres, which are the principal and essential part of every root. The descending caudex therefore corresponds to the radix of other botanists. Agreeably to this idea, Linnæus considers trees and shrubs as roots above ground; an opinion which is confirmed by a well-known fact, that trees, when inverted, put forth leaves from the descending caudex,

and radicles or roots from the ascending. For the varieties in the descending caudex, see the article RADIX.

CAUDIUM (anc. geog.), a town of Samnium, on the Via Appia, between Calatia and Beneventum: *Caudinus*, the epithet. The *Caudinae Furcae*, or *Furculae*, were memorable by the disgrace of the Romans; being spears disposed in the form of a gallows under which prisoners of war were made to pass, and gave name to a defile or narrow pass near *Caudium*, Livy; where the Samnites obliged the Roman army and the two consuls to lay down their arms and pass under the gallows, or yoke, as a token of subjection.

CAVE, any large subterraneous hollow. These were undoubtedly the primitive habitations, before men began to build edifices above ground. The primitive method of burial was also to reposit the bodies in caves, which seems to have been the origin of catacombs. They long continued the proper habitations of shepherds. Among the Romans, *caves* (*antra*) used to be consecrated to nymphs, who were worshipped in caves, as other gods were in temples. The Persians also worshipped their god Mithras in a natural cave consecrated for the purpose by Zoroaster. The cave of the nymph Egeria is still shown at Rome. Kircher, after Gaffarellus, enumerates divers species of caves; as divine, natural, &c.—Of natural caves some are possessed of a medicinal virtue, as the Grotto de Serpente; others are poisonous or mephitical; some are replete with metalline exhalations, and others with waters. Divine caves were those said to affect the human mind and passions in various ways, and ever to inspire with a knowledge of future events. Such were the sacred caverns at Delphi which inspired the Pythia; the Sibyl's cave at Cumæ, still shown near the lake Avernus; the cave of Trophœus, &c.

CAVE (Dr William), a learned English divine born in 1637, educated in St John's college Cambridge; and successively minister of Hasely in Oxfordshire, All-hallows the Great in London, and of Islington. He became chaplain to Charles II. and in 1684 was installed a canon of Windsor. He compiled the *Lives of the Primitive Fathers in the three first centuries of the church*, which is esteemed a very useful work; and *Historia Litteraria*, &c. in which he gives an exact account of all who had written for or against Christianity, from the time of Christ to the 14th century: which works produced a warm controversy between Dr Cave and M. Le Clerc, who was then writing his *Bibliothèque Universelle* in Holland, and who charged the doctor with partiality. Dr Cave died in 1713.

CAVE (Edward), printer, celebrated as the projector of the *Gentleman's Magazine*,—the first publication of the species, and since

The fruitful mother of a thousand more, was born in 1691. His father being disappointed of some small family-expectations, was reduced to follow the trade of a shoemaker at Rugby in Warwickshire. The free school of this place, in which his son had, by the rules of its foundation, a right to be instructed, was then in high reputation, under the Rev. Mr Holyock, to whose care most of the neighbouring families, even of the highest rank, entrusted their sons. He had judgment

to

Caudium,
Cave.

Cave. to discover, and for some time generosity to encourage, the genius of young Cave; and was so well pleased with his quick progress in the school, that he declared his resolution to breed him for the university, and recommend him as a servitor to some of his scholars of high rank. But prosperity which depends upon the caprice of others, is of short duration. Cave's superiority in literature exalted him to an invidious familiarity with boys who were far above him in rank and expectations; and, as in unequal associations it always happens, whatever unlucky prank was played was imputed to Cave. When any mischief, great or small, was done, though perhaps others boasted of the stratagem when it was successful, yet upon detection or miscarriage, the fault was sure to fall upon poor Cave. The harsh treatment he experienced from this source, and which he bore for a while, made him at last leave the school, and the hope of a literary education, to seek some other means of gaining a livelihood.

He was first placed with a collector of the excise: but the insolence of his mistress, who employed him in servile drudgery, quickly disgusted him, and he went up to London in quest of more suitable employment. He was recommended to a timber-merchant at the Bankside: and while he was there on liking, is said to have given hopes of great mercantile abilities: but this place he soon left, and was bound apprentice to Mr Collins, a printer of some reputation, and deputy-alderman. This was a trade for which men were formerly qualified by a literary education, and which was pleasing to Cave, because it furnished some employment for his scholastic attainments. Here, therefore, he resolved to settle, though his master and mistress lived in perpetual discord, and their house was therefore no comfortable habitation. From the inconveniences of these domestic tumults he was soon released, having in only two years attained so much skill in his art, and gained so much the confidence of his master, that he was sent without any superintendant to conduct a printing-house at Norwich, and publish a weekly paper. In this undertaking he met with some opposition, which produced a public controversy, and procured young Cave the reputation of a writer.

His master died before his apprenticeship was expired, and he was not able to bear the perverseness of his mistress. He therefore quitted her house upon a stipulated allowance, and married a young widow with whom he lived at Bow. When his apprenticeship was over, he worked as a journeyman at the printing-house of Mr Barber, a man much distinguished and employed by the Tories, whose principles had at that time so much prevalence with Cave, that he was for some years a writer in *Mist's Journal*. He afterwards obtained by his wife's interest a small place in the post-office; but still continued, at his intervals of attendance, to exercise his trade or to employ himself with some typographical business. He corrected the *Gradus ad Parnassum*: and was liberally rewarded by the company of stationers. He wrote an *Account of the Criminals*, which had for some time a considerable sale; and published many little pamphlets that accident brought into his hands, of which it would be very difficult to recover the memory. By the correspondence which his place in the post-office facilitated, he pro-

cured a country news-paper, and sold their intelligence to a journalist in London for a guinea a week. He was afterwards raised to the office of clerk of the franks, in which he acted with great spirit and firmness; and often stopped franks which were given by members of parliament to their friends, because he thought such extension of a peculiar right illegal. This raised many complaints; and the influence that was exerted against him procured his ejection from office. He had now, however, collected a sum sufficient for the purchase of a small printing-office, and began the *Gentleman's Magazine*; an undertaking to which he owed the affluence in which he passed the last 20 years of his life, and the large fortune which he left behind him. When he formed the project, he was far from expecting the success which he found; and others had so little prospect of its consequence, that though he had for several years talked of his plan among printers and booksellers, none of them thought it worth the trial. That they were not (says Dr Johnson) restrained by their virtue from the execution of another man's design, was sufficiently apparent as soon as that design began to be gainful; for in a few years a multitude of magazines arose, and perished: only the *London Magazine*, supported by a powerful association of booksellers, and circulated with all the art and all the cunning of trade, exempted itself from the general fate of Cave's invaders, and obtained though not an equal yet a considerable sale.

Cave now began to aspire to popularity; and being a greater lover of poetry than any other art, he sometimes offered subjects for poems, and proposed prizes for the best performers. The first prize was 50 l. for which, being but newly acquainted with wealth, and thinking the influence of 50 l. extremely great, he expected the first authors of the kingdom to appear as competitors; and offered the allotment of the prize to the universities. But when the time came, no name was seen among the writers that had been ever seen before; the universities and several private men rejected the province of assigning the prize. The determination was then left to Dr Cromwell Mortimer and Dr Birch; and by the latter the award was made, which may be seen in *Gent. Mag.* Vol. VI. p. 59.

Mr Cave continued to improve his Magazine, and had the satisfaction of seeing its success proportionate to his diligence, till in 1751 his wife died of an asthma. He seemed not at first much affected by her death, but in a few days lost his sleep and his appetite, which he never recovered. After having lingered about two years, with many vicissitudes of amendment and relapse, he fell by drinking acid liquors into a diarrhoea, and afterwards into a kind of lethargic insensibility; and died Jan. 10. 1754, having just concluded the 23d annual collection.

CAVEARE. See CAVIARE.

CAVEAT, in law, a kind of process in the spiritual courts, to stop the proving of a will, the granting tithes of administration, &c. to the prejudice of another. It is also used to stop the institution of a clerk to a benefice.

CAVEATING, in fencing, is the shifting the sword from one side of that of your adversary to the other.

Cave
||
Caveating.

Cavedo,
Cavendish.

CAVEDO, in commerce, a Portuguese long measure, equal to $27\frac{3}{4}$ English inches.

CAVENDISH (Thomas), of Suffolk, the second Englishman that sailed round the globe, was descended from a noble family in Devonshire. Having dissipated his fortune, he resolved to repair it at the expence of the Spaniards. He sailed from Plymouth with two small ships in July 1586; passed through the straits of Magellan; took many rich prizes along the coasts of Chili and Peru; and near California possessed himself of the St Ann, an Acapulco ship, with a cargo of immense value. He completed the circumnavigation of the globe, by returning home round the Cape of Good Hope, and reached Plymouth again in September 1588. On his arrival, it is said, that his soldiers and sailors were clothed in silk, his sails were damask, and his topmast was covered with cloth of gold. His acquired riches did not last long: he reduced himself, in 1591, to the expedient of another voyage; which was far from being so successful as the former; he went no farther than the straits of Magellan, where the weather obliging him to return, he died of grief on the coast of Brazil.

CAVENDISH (Sir William), descended of an ancient and honourable family, was born about the year 1505, the second son of Thomas Cavendish, of Cavendish in Suffolk, clerk of the pipe in the reign of Henry VIII. Having had a liberal education, he was taken into the family of the great cardinal Woolsey, whom he served in the capacity of gentleman-usher of the chamber, when that superb prelate maintained the dignity of a prince. In 1527, he attended his master on his splendid embassy to France, returned with him to England, and was one of the few who continued faithful to him in his disgrace. Mr Cavendish was with him when he died, and delayed going to court till he had performed the last duty of a faithful servant by seeing his body decently interred. The king was so far from disapproving of his conduct, that he immediately took him into his household, made him treasurer of his chamber, a privy-counsellor, and afterwards conferred on him the order of knighthood. He was also appointed one of the commissioners for taking the surrender of religious houses. In 1540 he was nominated one of the auditors of the court of augmentations, and soon after obtained a grant of several considerable lordships in Hertfordshire. In the reign of Edward VI. his estates were much increased by royal grants in seven different counties; and he appears to have continued in high favour at court during the reign of queen Mary. He died in the year 1557. He was the founder of Chatsworth, and ancestor of the dukes of Devonshire. He wrote "The life and death of cardinal Woolsey:" printed at London 1667; reprinted in 1706, under the title of "Memoirs of the great favourite cardinal Woolsey."

CAVENDISH (William), duke of Newcastle, grandson of Sir William Cavendish, was born in 1592. In 1610, he was made knight of the bath; in 1620, raised to the dignity of a peer, by the title of baron Ogle, and viscount Mansfield; and in the third year of king Charles I. created earl of Newcastle upon Tyne, and baron Cavendish of Bolsover. He was after this made governor to the prince of Wales, afterwards Charles II. When the first troubles broke

out in Scotland, and the king's treasury was but indifferently provided, he contributed ten thousand pounds; and also raised a troop of horse, consisting of about two hundred knights and gentlemen, who served at their own charge, were commanded by the earl, and honoured with the title of *the prince's troop*. He had after this the command of the northern counties; and was constituted general and commander in chief of all the forces that might be raised north of Trent, and of several counties south of that river. He afterwards raised an army of eight thousand horse, foot, and dragoons; with which he took some towns, and gained several important victories. On this he was advanced to the dignity of marquis of Newcastle: but his majesty's affairs being totally ruined by the rashness of prince Rupert, he, with a few of the principal officers of the army, went abroad, and staid for some time at Paris; where, notwithstanding the vast estate he had when the civil war broke out, his circumstances were now so bad, that himself and wife were reduced to the necessity of pawning their clothes for a dinner. He afterwards removed to Antwerp, that he might be nearer his own country; and there, though under great difficulties, resided for several years: but, notwithstanding his distresses, he was treated, during an exile of eighteen years, with extraordinary marks of distinction. On his return to England at the restoration, he was advanced to the dignity of earl of Ogle and duke of Newcastle. He spent his time in a country retirement, and was the patron of men of merit. His grace died in 1679, aged 84. He wrote a treatise on horsemanship, which is esteemed; and some comedies, which are not.

Mr Granger observes, that he was master of many accomplishments, and was much better qualified for a court than a camp: that he understood horsemanship, music, and poetry; but was a better horseman than musician, and a better musician than poet.

CAVENDISH (Margaret), duchess of Newcastle, famous for her voluminous productions, was born about the latter end of the reign of James I. and was the youngest sister of Lord Lucas of Colchester. She married the duke of Newcastle abroad in 1645; and on their return after the restoration, spent the remainder of her life in writing plays, poems, with the life of her husband, to the amount of about a dozen of folios. "What gives the best idea of her unbounded passion for scribbling (says Mr Walpole), was her seldom revising the copies of her works, lest, as she said, it should disturb her following conceptions." She died in 1673.

CAVENDISH (William), the first duke of Devonshire, and one of the most distinguished patriots in the British annals, was born in 1640. In 1677, being then member for Derby, he vigorously opposed the venal measures of the court; and, the following year, was one of the committee appointed to draw up articles of impeachment against the lord treasurer Danby. In 1679, being re-elected to serve for Derby in a new parliament, Charles II. thought fit to make him a privy counsellor; but he soon withdrew from the board, with his friend lord Russel, when he found that popish interest prevailed. He carried up the articles of impeachment to the house of lords, against lord chief justice Scroggs, for his arbitrary and illegal proceedings

Cavendish.

||
Caviare.

ings in the court of king's bench; and when the king declared his resolution not to sign the bill for excluding the Duke of York (afterwards James II.), he moved the house of commons, that a bill might be brought in for the association of all his majesty's protestant subjects. He also openly named the king's evil counsellors, and voted for an address to remove them from his presence and councils for ever. He nobly appeared at lord Russell's trial, in defence of that great man, at a time when it was scarce more criminal to be an accomplice than a witness for him. The same fortitude, activity, and love of his country, animated this illustrious patriot to oppose the arbitrary proceedings of James II.; and when he saw there was no other method of saving the nation from impending slavery, he was the foremost in the association for inviting over the prince of Orange, and the first nobleman who appeared in arms to receive him at his landing. He was created Duke of Devonshire in 1694, by William and Mary. His last public service was in the union with Scotland, for concluding of which he was appointed a commissioner by queen Anne. He died in 1707, and ordered the following inscription to be put on his monument.

*Willielmus Dux Devon,
Bonorum Principum Fidelis Subditus,
Inimicus et Invidus Tyrannis.*

William Duke of Devonshire,
Of good Princes the faithful Subject,
The Enemy and Aversion of Tyrants.

Besides being thus estimable for public virtues, his grace was distinguished by his literary accomplishments. He had a poetical genius, which showed itself particularly in two pieces, written with equal spirit, dignity, and delicacy: these are, an ode on the death of queen Mary; and an allusion to the archbishop of Cambray's supplement to Homer. He had great knowledge in the languages, was a true judge in history, and a critic in poetry; he had a fine hand in music, an elegant taste in painting, and in architecture had a skill equal to any person of the age in which he lived. His predecessor, Sir John Cavendish, was the person who killed the famous Watt Tyler in 1381.

CAVETTO, in architecture, a hollow member, or round concave moulding, containing a quadrant of a circle, and having a quite contrary effect to that of a quarter round: it is used as an ornament in cornices.

CAVEZON, in the manege, a sort of nose-band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted, clapt upon the nose of a horse to wring it, and so forward the suppling and breaking of the horse.

* See Ac.
caviar. CAVIARE, a kind of food lately introduced into Britain. It is made of the hard roes of sturgeon*, formed into small cakes, about an inch thick and three or four inches broad. The method of making it is, by taking out of the spawn all the nerves or strings, then washing it in white-wine or vinegar, and spreading it on a table. It is then salted and pressed in a fine bag; after which it is cased up in a vessel with a hole at the bottom, that if any moisture is left it may run out. This kind of food is in great request among the Moscovites, on account of their three lents, which they keep with a superstitious exactness; wherefore the Italians settled at Moscow drive a very great trade in this commodity throughout that empire, there being

Cavidos
||
Caurines.

a prodigious quantity of sturgeon taken at the mouth of the Wolga and other rivers which fall into the Caspian sea. A pretty large quantity of the commodity is also consumed in Italy and France. They get the caviare from Archangel, but commonly buy it at second hand of the English and Dutch.—According to Savary, the best caviare brought from Muscovy is prepared from the belluga, a fish eight or ten feet long, caught in the Caspian sea, which is much preferable to that made of the spawn of sturgeon. A kind of caviare, or rather sausage, is also made from the spawn of some other fishes; particularly a sort of mullet caught in the Mediterranean. See MUGIL and BOTTARGO.

Insect CAVIARE. See AXAYACATL.

CAVIDOS. See CABIDOS.

CAVIL, (*cavillatio*), is defined by some a fallacious kind of reason, carrying some resemblance of truth, which a person, knowing its falsehood, advances in dispute for the sake of victory. The art of framing sophisms or fallacies is called by Boethius *cavillatoria*.

CAUK, or CAWK. See TERRA PONDEROSA, and CHEMISTRY, *Index*.

CAUKING, or CAULKING, of a ship, is driving a quantity of oakum, or old ropes untwisted and drawn asunder, into the seams of the planks, or into the intervals where the planks are joined together in the ship's decks or sides, in order to prevent the entrance of water. After the oakum is driven very hard into these seams, it is covered with hot melted pitch or rosin, to keep the water from rotting it.

Among the ancients, the first who made use of pitch in caulking, were the inhabitants of Phœacia, afterwards called Corfica. Wax and rosin appear to have been commonly used previous to that period; and the Poles at this time use a sort of unctuous clay for the same purpose, on their navigable rivers.

CAULKING-Irons, are iron chissels for that purpose. Some of these irons are broad, some round, and others grooved. After the seams are stopped with oakum, it is done over with a mixture of tallow, pitch, and tar, as low as the ship draws water.

CAUL, in anatomy, a membrane in the abdomen, covering the greatest part of the guts; called, from its structure, *Reticulum*, but most frequently *Omentum*. See ANATOMY, n^o 90.

CAUL is likewise a little membrane, found on some children, encompassing the head when born.

Drelincourt takes the *caul* to be only a fragment of the membranes of the fœtus; which ordinarily break at the birth of the child. Lampridius tells us, that the midwives sold this *caul* at a good price to the advocates and pleaders of his time; it being an opinion, that while they had this about them, they should carry with them a force of persuasion which no judge could withstand: the canons forbid the use of it; because some witches and forcerers, it seems, had abused it.

CAULIFLOWERS, in gardening, a much esteemed species of cabbage. See BRASSICA.

CAURIS, in natural history, a name given by some to the genus of shells called, by the generality of writers, *porcellana*, and *concha venerea*. It is from a false pronunciation of this word *cauris* that we call these shells *gowries*. See PORCELAIN-Shell.

CAURSINES, (*Courfini*); were Italians that came into England about the year 1235, terming themselves

Causa
||
Cause.

the Pope's merchants, but driving no other trade than letting out money; and having great banks in England, they differed little from Jews, save (as history says) they were rather more merciless to their debtors. Some will have them called *Coursines*, quasi *Causa Ursini*, bearish and cruel in their causes; others *Caorsini* or *Corfini*, as coming from the isle of Corsica; but Cowel says, they have their name from *Caorsium*, *Caorsi*, a town in Lombardy, where they first practised their arts of usury and extortion; from whence, spreading themselves, they carried their infamous trade through most parts of Europe, and were a common plague to every nation where they came. The then bishop of London excommunicated them; and king Henry III. banished them from this kingdom in the year 1240. But, being the pope's solicitors and money-changers, they were permitted to return in the year 1250; tho' in a very short time they were again driven out of the kingdom on account of their intolerable exactions.

CAUSA MATRIMONII PRÆLOCUTI, in common law, a writ that lies where a woman gives land to a man in fee to the intent he shall marry her, and he refuses to do it in a reasonable time, being thereunto required by the woman; and in such case, for not performing the condition, the entry of the woman into the lands again has been adjudged lawful.

The husband and wife may sue this writ against another who ought to have married her.

CAUSALITY, among metaphysicians, the action or power of a cause in producing its effect.

CAUSALTY, among miners, denotes the lighter, sulphureous, earthy parts of ores, carried off in the operation of washing. This, in the mines, they throw in heaps upon banks, which in six or seven years they find it worth their while to work over again.

CAUSE, that from whence any thing proceeds, or by virtue of which any thing is done: it stands opposed to effect. We get the ideas of cause and effect from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. That which produces, is the cause; and that which is produced, the effect: thus, fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

Reid on the
Active Power
of Man.

Aristotle, and the schoolmen after him, distinguished four kinds of causes; the efficient, the material, the formal, and the final. This, like many of Aristotle's distinctions, is only a distinction of the various meanings of an ambiguous word; for the efficient, the matter, the form and the end, have nothing common in their nature, by which they may be accounted species of the same genus; but the Greek word, which we translate *cause*, had these four different meanings in Aristotle's days, and we have added other meanings. We do not indeed call the matter or the form of a thing its cause; but we have final causes, instrumental causes, occasional causes, and many others. Thus the word *cause* has been so hackneyed, and made to have so many different meanings in the writings of philosophers, and in the discourse of the vulgar, that its original and proper meaning is lost in the crowd.

With regard to the phenomena of nature, the important end of knowing their causes, besides gratifying

our curiosity, is, that we may know when to expect them, or how to bring them about. This is very often of real importance in life; and this purpose is served, by knowing what, by the course of nature, goes before them and is connected with them; and this, therefore, we call the *cause* of such a phenomenon.

If a magnet be brought near to a mariner's compass, the needle, which was before at rest, immediately begins to move, and bends its course towards the magnet, or perhaps the contrary way. If an unlearned sailor is asked the cause of this motion of the needle, he is at no loss for an answer. He tells you it is the magnet; and the proof is clear; for, remove the magnet, and the effect ceases; bring it near, and the effect is again produced. It is, therefore, evident to sense, that the magnet is the cause of this effect.

A Cartesian philosopher enters deeper into the cause of this phenomenon. He observes, that the magnet does not touch the needle, and therefore can give it no impulse. He pities the ignorance of the sailor. The effect is produced, says he, by magnetic effluvia, or subtil matter, which passes from the magnet to the needle, and forces it from its place. He can even show you, in a figure, where these magnetic effluvia issue from the magnet, what round they take, and what way they return home again. And thus he thinks he comprehends perfectly how, and by what cause, the motion of the needle is produced.

A Newtonian philosopher inquires what proof can be offered for the existence of magnetic effluvia, and can find none. He therefore holds it as a fiction, a hypothesis; and he has learned that hypotheses ought to have no place in the philosophy of nature. He confesses his ignorance of the real cause of this motion, and thinks that his business as a philosopher is only to find from experiment the laws by which it is regulated in all cases.

These three persons differ much in their sentiments with regard to the real cause of this phenomenon; and the man who knows most is he who is sensible that he knows nothing of the matter. Yet all the three speak the same language, and acknowledge that the cause of this motion is the attractive or repulsive power of the magnet.

What has been said of this, may be applied to every phenomenon that falls within the compass of natural philosophy. We deceive ourselves, if we conceive that we can point out the real efficient cause of any one of them.

The grandest discovery ever made in natural philosophy, was that of the law of gravitation, which opens such a view of our planetary system, that it looks like something divine. But the author of this discovery was perfectly aware that he discovered no real cause, but only the law or rule according to which the unknown cause operates.

Natural philosophers, who think accurately, have a precise meaning to the terms they use in the science; and when they pretend to show the cause of any phenomenon of nature, they mean by the cause, a law of nature of which that phenomenon is a necessary consequence.

The whole object of natural philosophy, as Newton expressly teaches, is reducible to these two heads: first, by just induction from experiment and observation, to

Cause, discover the laws of nature; and then to apply those laws to the solution of the phenomena of nature. This was all that this great philosopher attempted, and all that he thought attainable. And this indeed he attained in a great measure, with regard to the motions of our planetary system, and with regard to the rays of light.

But supposing that all the phenomena which fall within the reach of our senses were accounted for from general laws of nature justly deduced from experience; that is, supposing natural philosophy brought to its utmost perfection; it does not discover the efficient cause of any one phenomenon in nature.

The laws of nature are the rules according to which the effects are produced; but there must be a cause which operates according to these rules. The rules of navigation never navigated a ship. The rules of architecture never built a house.

Natural philosophers, by great attention to the course of nature, have discovered many of her laws, and have very happily applied them to account for many phenomena: but they have never discovered the efficient cause of any one phenomenon; nor do those who have distinct notions of the principles of the science make any such pretence.

Upon the theatre of nature we see innumerable effects, which require an agent endowed with active power; but the agent is behind the scene. Whether it be the Supreme Cause alone, or a subordinate cause or causes; and if subordinate causes be employed by the Almighty, what their nature, their number, and their different offices may be; are things hid, for wise reasons, without doubt, from the human eye.

CAUSE, among civilians, the same with action. See **ACTION**.

CAUSE, among physicians. The cause of a disease is defined by Galen to be that during the presence of which we are ill, and which being removed the disorder immediately ceases. The doctrine of the causes of diseases is called **ETIOLOGY**.

Physicians divide causes into procatartetic, antecedent, and continent.

Procatartetic CAUSE, αἰτία προκαταρτική, called also *primitive and incipient cause*, is either an occasion which of its own nature does not beget a disease, but, happening on a body inclined to diseases, breeds a fever, gout, &c. (such as are watching, fasting, and the like); or an evident and manifest cause, which immediately produces the disease, as being sufficient thereto, such as is a sword in respect of a wound.

Antecedent CAUSE, αἰτία προηγουμένη, a latent disposition of the body, from whence some disease may arise; such as a plethora in respect of a fever, a cacochymia in respect of a scurvy.

Continent, Conjunct, or Proximate CAUSE, that principle in the body, which immediately adheres to the disease, and which being present, the disease is also present; or, which being removed, the disease is taken away: such is the stone in a nephritic patient.

CAUSEWAY, or **CAUSEY**, a massive construction of stone, stakes, and fascines; or an elevation of fat, viscous earth, well beaten; serving either as a road in wet marshy places, or as a mole to retain the waters of a pond, or prevent a river from overflowing the lower grounds. See **ROAD**.—The word comes from

the French *Chaussee*, anciently wrote *Chaulsee*; and that from the Latin *Calceata*, or *Calcata*; according to Somner and Spelman, *a calcando*. Bergier rather takes the word to have had its rise à *peditum calceis, quibus teruntur*. Some derive it from the Latin *calx*, or French *chaux*, as supposing it primarily to denote a way paved with chalk-stones.

CAUSEWAY, *calcetum*, or *calcea*, more usually denotes a common hard raised way, maintained and repaired with stones and rubbish.

Devil's CAUSEWAY, a famous work of this kind, which ranges through the county of Northumberland, commonly supposed to be Roman, though Mr Horsley suspects it to be of later times.

Giant's CAUSEWAY, is a denomination given to a huge pile of stony columns in the district of Coleraine in Ireland. See **GIANT'S CAUSEWAY**.

CAUSSIN (Nicholas), surnamed the Just, a French Jesuit, was born at Troyes in Champagne, in the year 1580; and entered into the Jesuits order when he was 26 years of age. He taught rhetoric in several of their colleges, and afterwards began to preach, by which he gained very great reputation. He increased this reputation by publishing books, and in time was preferred to be confessor to the king. But he did not discharge this office to the satisfaction of Cardinal Richelieu, though he discharged it to the satisfaction of every honest man; and therefore, it is not to be wondered at that he came at length to be removed. He died in the Jesuits convent at Paris in 1651. None of his works did him more honour than that which he entitled *La Cour Sainte*. It has been printed a great many times; and translated into Latin, Italian, Spanish, Portuguese, German, and English. He published several other books both in Latin and French.

CAUSTICITY, a quality belonging to several substances, by the acrimony of which the parts of living animals may be corroded and destroyed. Bodies which have this quality, when taken internally, are true poisons. The causticity of some of these, as of arsenic, is so deadly, that even their external use is proscribed by prudent physicians. Several others, as nitrous acid, lapis infernalis or lunar caustic, common caustic, butter of antimony, are daily and successfully used to consume fungous flesh, to open issues, &c. They succeed very well when properly employed and skilfully managed.

The causticity of bodies depends entirely on the state of the saline, and chiefly of the acid, matters they contain. When these acids happen to be at the same time much concentrated, and slightly attached to the matters with which they are combined, they are then capable of acting, and are corrosive or caustic. Thus fixed and volatile alkalies, although they are themselves caustic, become much more so by being treated with quicklime; because this substance deprives them of much fat and inflammable matter, and all their fixed air, which binds and restrains the action of their saline principle. By this treatment, then, the saline principle is more disengaged, and rendered more capable of action. Also all combinations of metallic matters with acids form salts more or less corrosive, because these acids are deprived of all their superabundant water, and are besides but imperfectly saturated with the metallic matters. Nevertheless, some other circumstance is necessary to constitute the causticity of these saline metalline.

Causeway,
Causticity.

Causiticity. metalline matters. For the same quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, shall, however, produce all the effects of a corrosive poison, when it is united with mercury in *corrosive sublimate*, although the sublimate shall be dissolved in so much water that its causiticity cannot be attributed to the concentration of its acid. This effect is, by some chemists, attributed to the great weight of the metallic matters with which the acid is united: and this opinion is very probable, seeing its causiticity is nothing but its dissolving power, or its disposition to combine with other bodies; and this disposition is nothing else than attraction.

On this subject Dr Black observes, that the compounds produced by the union of the metals with acids are in general corrosive. Many of them applied to the skin destroy it almost as fast as the mineral acids; and some of the most powerful potential cauteries are made in this way. Some are reckoned more acid than the pure acids themselves; and they have more powerful effects when taken internally, or at least seem to have. Thus we can take 10 or 12 drops of a fossil acid, diluted with water, without being disturbed by it; but the same quantity of acid previously combined with silver, quicksilver, copper, or regulus of antimony, will throw the body into violent disorders, or even prove a poison, if taken all at once.

This increased activity was, by the mechanical philosophers, supposed to arise from the weight of the metallic particles. They imagined that the acid was composed of minute particles of the shape of needles or wedges; by which means they were capable of entering the pores of other bodies, separating their atoms from each other, and thus dissolving them. To these acid spiculæ the metallic particles gave more force; and the momentum of each particular needle or wedge was increased in proportion to its increase of gravity by the additional weight of the metallic particle. But this theory is entirely fanciful, and does not correspond with facts. The activity of the compound is not in proportion to the weight of the metal; nor are the compounds always possessed of any great degree of acrimony: neither is it true that any of them have a greater power of destroying animal substances than the pure acids have.

There is a material difference between the powers called *stimuli* and *corrosives*. Let a person apply to any part of the skin a small quantity of lunar caustic, and likewise a drop of strong nitrous acid, and he will find that the acid acts with more violence than the caustic; and the disorders that are occasioned by the compounds of metals and acids do not proceed from a *causiticity* in them, but from the metal affecting and proving a stimulus to the nerves: and that this is the case, appears from their affecting some particular nerves of the body. Thus the compounds of regulus of antimony and mercury with the vegetable acids, do not show the smallest degree of acrimony; but, taken internally, they produce violent convulsive motions over the whole body, which are occasioned by the metallic matter having a power of producing this effect; and the acid is only the means of bringing it into a dissolved state, and making it capable of acting on the nervous system. In general, however, the compounds of

Nº 67.

metallic substances with acids may be considered as milder than the acids in a separate state; but the acid is not so much neutralized as in other compounds, for it is less powerfully attracted by the metal; so that alkaline salts, absorbent earths, or even heat alone, will decompose them; and some of the inflammable substances, as spirit of wine, aromatic oils, &c. will attract the acid, and precipitate the metal in its metallic form; and the metals can be employed to precipitate one another in their metallic form; so that the cohesion of these compounds is much weaker than those formed of the same acids with alkaline salts or earths.

CAUSTICS, in physics, an appellation given to medicines of so hot and fiery a nature, that, being applied, consume, and as it were burn, the texture of the parts, like hot iron.

Caustics are generally divided into four sorts; the common stronger caustic, the common milder caustic, the antimonial caustic, and the lunar caustic. See PHARMACY and CHEMISTRY.

CAUSTIC Curve, in the higher geometry, a curve formed by the concurrence or coincidence of the rays of light reflected from some other curve.

CAUSUS, or BURNING FEVER, a species of continual fever, accompanied with a remarkable inflammation of the blood.

CAUTERIZATION, the act of burning or searing some morbid part, by the application of fire either actual or potential. In some places they cauterize with burning tow, in others with cotton or moxa, in others with live coals; some use Spanish wax, others pyramidal pieces of linen, others gold or silver; Severinus recommends flame blown through a pipe; but what is usually preferred among us is a hot iron.

Cauterizing irons are of various figures; some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, Ferrara, and others. Sometimes a cautery is applied through a capsula, to prevent any terror from the sight of it. This method was invented by Placentinus, and is described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive plaster, or lint moistened in oxycerate. Sometimes the hot iron is transmitted through a copper canula, for the greater safety of the adjoining parts. The degrees and manners of cauterizing are varied according to the nature of the disease and the part affected.

CAUTERY, in surgery, a medicine for burning, eating, or corroding any solid part of the body.

Cauteries are distinguished into two classes; actual and potential: by actual cauteries are understood red hot instruments, usually of iron; and by potential cauteries are understood certain kinds of corroding medicines. See PHARMACY.

CAUTION, in the civil and Scots law, denotes much the same with what, in the law of England, is called BAIL.

CAUTIONER, in Scots law, that person who becomes bound for another to the performance of any deed or obligation. As to the different kinds and effects of Cautionry, see LAW, Part III. Nº clxxv. 19.

CAWK. See CAUK.

CAXA, a little coin made of lead mixed with some scoria

Caxamalca scoria of copper, struck in China, but current chiefly at Bantam in the island of Java, and some of the neighbouring islands. See (the *Table* subjoined to) *MONEY*.

CAXAMALCA, the name of a town and district of Peru in South America, where there was a most sumptuous palace belonging to the Incas, and a magnificent temple dedicated to the sun.

CAXTON (William), a mercer of London, eminent by the works he published, and for being *reputed* the first who introduced and practised the art of printing in England: as to which, see (*the History of*) *PRINTING*.

CAYENNE, a rich town and island of South America, and capital of the French settlements there, is bounded on the north by the Dutch colonies of Surinam, and situated in W. Long. 53. 10. N. Lat. 50.

This settlement was begun in 1635. A report had prevailed for some time before, that, in the interior parts of Guiana, there was a country known by the name of *del Dorado*, which contained immense riches in gold and precious stones; more than ever Cortez and Pizarro had found in Mexico and Peru; and this fable had fired the imagination of every nation in Europe. It is supposed that this was the country in quest of which Sir Walter Raleigh went on his last voyage; and, as the French were not behind their neighbours in their endeavours to find out so desirable a country, some attempts, for this purpose, were likewise made by that nation much about the same time; which at last coming to nothing, the adventurers took up their residence on the island of Cayenne. In 1643, some merchants of Rouen united their stock, with a design to support the new colony; but, committing their affairs to one Poncet de Bretigny, a man of a ferocious disposition, he declared war both against the colonists and savages, in consequence of which he was soon massacred. This catastrophe entirely extinguished the ardour of these associates; and in 1651 a new company was established. This promised to be much more considerable than the former; and they set out with such a capital as enabled them to collect 700 or 800 colonists in the city of Paris itself. These embarked on the Seine, in order to sail down to Havre de Grace; but unfortunately the Abbé de Marivault, a man of great virtue, and the principal promoter of the undertaking, was drowned as he was stepping into his boat. Another gentleman, who was to have acted as general, was assassinated on his passage; and 12 of the principal adventurers, who had promised to put the colony into a flourishing situation, not only were the principal perpetrators of this fact, but uniformly behaved in the same atrocious manner. At last they hanged one of their own number; two died; three were banished to a desert island; and the rest abandoned themselves to every kind of excess. The commandant of the citadel deserted to the Dutch with part of his garrison. The savages, roused by numberless provocations, fell upon the remainder; so that the few who were left thought themselves happy in escaping to the Leeward Islands in a boat and two canoes, abandoning the fort, ammunition, arms, and merchandise, fifteen months after they had landed on the island.

In 1663, a new company was formed, whose capital amounted only to L. 8750. By the assistance of the ministry they expelled the Dutch, who had taken pos-

session of the island, and settled themselves much more comfortably than their predecessors. In 1667 the island was taken by the English, and in 1676 by the Dutch, but afterwards restored to the French; and since that time it has never been attacked. Soon after some pirates, laden with the spoils they had gathered in the South Seas, came and fixed their residence at Cayenne; resolving to employ the treasures they had acquired in the cultivation of the lands. In 1688, Ducasse, an able seaman, arrived with some ships from France, and proposed to them the plundering of Surinam. This proposal exciting their natural turn for plunder, the pirates betook themselves to their old trade, and almost all the rest followed their example. The expedition, however, proved unfortunate. Many of the assailants were killed, and all the rest taken prisoners and sent to the Caribbee Islands. This loss the colony has never yet recovered.

The island of Cayenne is about 16 leagues in circumference, and is only parted from the continent by two rivers. By a particular formation, uncommon in islands, the land is highest near the water side, and low in the middle. Hence the land is so full of morasses, that all communication between the different parts of it is impossible, without taking a great circuit. There are some small tracts of an excellent soil to be found here and there; but the generality is dry, sandy, and soon exhausted. The only town in the colony is defended by a covert way, a large ditch, a very good mud rampart, and five bastions. In the middle of the town is a pretty considerable eminence, of which a redoubt has been made that is called the *fort*. The entrance into the harbour is through a narrow channel; and ships can only get in at high water through the rocks and reefs that are scattered about this pass.

The first produce of Cayenne was the arnotto; from the produce of which, the colonists proceeded to that of cotton, indigo, and lastly sugar. It was the first of all the French colonies that attempted to cultivate coffee. The coffee-tree was brought from Surinam in 1721, by some deserters from Cayenne, who purchased their pardon by so doing. Ten or twelve years after they planted cocoa. In the year 1752, there were exported from Cayenne 260,541 pounds of arnotto, 80,363 pounds of sugar, 17,919 pounds of cotton, 26,881 pounds of coffee, 91,916 pounds of cocoa, 618 trees for timber, and 104 planks.

CAYLUS (Count de), Marquis de Sternay, Baron de Bransac, was born at Paris in 1692. He was the eldest of the two sons of John count de Caylus, lieutenant-general of the armies of the king of France, and of the Marchioness de Villete. The count and countess his father and mother, were very careful of the education of their son. The former instructed him in the profession of arms, and in bodily exercises: the latter watched over and fostered the virtues of his mind; and this delicate task she discharged with singular success. The countess was the niece of Madam de Maintenon, and was remarkable both for the solidity of her understanding and the charms of her wit. She was the author of that agreeable book intitled, "*The Recollections of Madam de Caylus*," of which Voltaire lately published an elegant edition. The amiable qualities of the mother appeared in the son; but they appeared with a bold and military

Cayenne,
Caylus.

Caylus.

litary air. In his natural temper he was gay and sprightly, had a taste for pleasure, a strong passion for independence, and an invincible aversion to the servitude of a court. Such were the instructors of the Count de Caylus. He was only twelve years of age when his father died at Brussels in 1704. After finishing his exercises, he entered into the corps of the *Mousquetaires*; and in his first campaign in the year 1709, he distinguished himself by his valour in such a manner, that Louis XIV. commended him before all the court, and rewarded him with an ensigncy in the *Gendarmerie*. In 1711 he commanded a regiment of dragoons, which was called by his own name; and he signalized himself at the head of it in Catalonia. In 1713, he was at the siege of Fribourg, where he was exposed to imminent danger in the bloody attack of the covered way. The peace of Rastade having left him in a state of inactivity ill-suited to his natural temper, his vivacity soon carried him to travel into Italy; and his curiosity was greatly excited by the wonders of that country, where antiquity is still fruitful, and produces so many objects to improve taste and to excite admiration. The eyes of the count were not yet learned; but he was struck with the sight of so many beauties, and soon became acquainted with them. After a year's absence, he returned to Paris with so strong a passion for travelling, and for antiquities, as induced him to quit the army.

He had no sooner quitted the service of Louis, than he sought for an opportunity to set out for the Levant. When he arrived at Smyrna, he visited the ruins of Ephesus. From the Levant he was recalled in February 1717 by the tenderness of his mother. From that time he left not France, but to make two excursions to London. The academy of painting and sculpture adopted him an honorary member in the year 1731; and the count, who loved to realize titles, spared neither his labour, nor his credit, nor his fortune, to instruct, assist, and animate the artists. He wrote the lives of the most celebrated painters and engravers that have done honour to this illustrious academy; and, in order to extend the limits of the art, which seemed to him to move in too narrow a circle, he collected, in three different works, new subjects for the painter, which he had met with in the works of the ancients.

Such was his passion for antiquity, that he wished to have had it in his power to bring the whole of it to life again. He saw with regret, that the works of the ancient painters, which have been discovered in our times, are effaced and destroyed almost as soon as they are drawn from the subterraneous mansions where they were buried. A fortunate accident furnished him with the means of showing us the composition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France's cabinet with them, he gave an edition of them at his own expence. It is perhaps the most extraordinary book of antiquities that ever will appear. The whole is painted with a purity and a precision that are inimitable: we see the liveliness and the freshness of the colouring that charmed the Cæsars. There were only 30 copies

published; and there is no reason to expect that there will hereafter be any more.

Caylus.

Count de Caylus was engaged at the same time in an enterprise still more favourable to Roman grandeur, and more interesting to the French nation. Colbert had framed the design of engraving the Roman antiquities that are still to be seen in the southern provinces of France. By his orders Mignard the architect had made drawings of them, which count de Caylus had the good fortune to recover. He resolved to finish the work begun by Colbert, and to dedicate it to that great minister; and so much had he this enterprise at heart, that he was employed in it during his last illness, and warmly recommended it to M. Mariette.

In 1742, Count Caylus was admitted honorary member of the academy of belles lettres; and then it was that he seemed to have found the place for which nature designed him. The study of literature now became his ruling passion; he consecrated to it his time and his fortune; he even renounced his pleasures to give himself wholly up to that of making some discovery in the field of antiquity. But amidst the fruits of his research and invention, nothing seemed more flattering to him than his discovery of encaustic painting. A description of Pliny's, but too concise to give him a clear view of the matter, suggested the idea of it. He availed himself of the friendship and skill of M. Magault, a physician in Paris, and an excellent chemist; and by repeated experiments found out the secret of incorporating wax with divers tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encaustic painting practised by the ancients; one of which was performed with wax, and the other upon ivory, with hot punches of iron. It was the former that Count Caylus had the merit of reviving; and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endless to give an account of all his works. He published above 40 dissertations in the *Memoirs of the Academy of Belles Lettres*. The artists he was particularly attentive to; and to prevent their falling into mistakes from an ignorance of costume, which the ablest of them have sometimes done, he founded a prize of 500 livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. In order that he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 copperplates.

The strength of his constitution seemed to give him hopes of a long life: but a humour settling in one of his legs, which entirely destroyed his health, he expired on the 5th of September 1765, and by his death his family is extinct. The tomb erected to the honour of Count Caylus is to be seen in the chapel of St Germain-l'Auxerrois, and deserves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had

Cayster had destined it to grace the place of his interment. While he availed the fatal hour, he placed it in his garden, where he used to look upon it with a tranquil but thoughtful eye, and pointed it out to the inspection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In society, he had all the frankness of a soldier, and a politeness which had nothing in it of deceit or circumvention. Born independent, he applied to studies which suited his taste. His heart was yet better than his abilities. In his walks he used frequently to try the honesty of the poor, by sending them with a piece of money to get change for him. In these cases he enjoyed their confusion at not finding him; and then presenting himself, used to commend their honesty, and give them double the sum. He said frequently to his friends, "I have this day lost a crown; but I was sorry that I had not an opportunity of giving a second. The beggar ought not to want integrity."

CAYSTER, or **CAYSTRUS**, (anc. geog.), a river of Ionia, whose mouth Ptolemy places between Colophon and Ephesus; commended by the poets for its swans, which it had in great numbers. Its source was in the Montes Cilbani, (Pliny). *Caystrius Campus* was a part of the territory of Ephesus. *Campi Caystriani* of Lydia, were plains lying in the middle between the inland parts and mount Tmolus.

CAZEROM, or **CAZERON**, a city of Asia in Persia, situated in E. Long. 70. N. Lat. 29. 15.

CAZIC, or **CAZIQUE**, a title given by the Spaniards to the petty kings, princes, and chiefs, of the several countries of America, excepting those of Peru, which are called *curatas*. The French call them *casiques*, a denomination which they always give to the Tartarian hords.—The cazics, in some places, do the office of physicians, and in others of priests, as well as of captains. The dignity of cazic among the Chiites, a people of South America, does not descend to children, but must be acquired by valour and merit. One of the prerogatives annexed to it is, that the cazic may have three wives, while the other people are allowed only one. Mexico comprehended a great number of provinces and islands, which were governed by lords called *caziques*, dependent on and tributary to the emperor. Thirty of these vassals are said to have been so powerful, that they were able, each of them, to bring an army of 100,000 men into the field.

CAZIMIR, a handsome town of Poland, in the palatinate of Lublin, situated on a hill covered with trees, in E. Long. 3. 10. N. Lat. 51. 5.

CEA. See **CEOS**.

CEANOTHUS, **NEW-JERSEY TEA**, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 43d order, *Dumose*. There are five petals, pouched and arched. The fruit is a dry, trilocular and trispermous berry. There are three species, of which the most remarkable is the *Americanus*, a native of most parts of North America, from whence great plenty of the seeds have been imported into Europe. In England, this plant seldom rises more than three feet high. The stem, which is of a pale-brown colour, sends out branches from the bottom. These

are thin, flexible, and of a reddish colour, which may have occasioned this tree to go by the name of *Red Twig*. The leaves which ornament these branches stand on reddish pedicles, about half an inch in length. They are oval, serrated, pointed, about two inches and a half long, are proportionably broad, and have three nerves running lengthwise. From the footstalk to the point they are of a light green colour, grow irregularly on the branches, and not opposite by pairs, as has been asserted. They are late in the spring before they shoot. The flowers grow at the ends of the twigs in clusters: They are of a white colour, and when in blow give the shrub a most beautiful appearance. Indeed, it seems to be almost covered with them, as there is usually a cluster at the end of nearly every twig; and the leaves which appear among them serve as ornaments only, like myrtle in a distant nosegay: nature however has denied them smell. This tree will be in blow in July; and the flowers are succeeded by small brownish fruit, in which the seeds will sometimes ripen in England.

This plant is propagated by layering; or from seeds sown in pots of compost, consisting of two parts virgin earth well tempered and one part sand, about a quarter of an inch deep; being equally careful to defend the young seedlings from an extremity of cold in winter, as from the parching drought of the summer months. The best time of layering them is in the summer, just before they begin to flower: At that time lay the tender twigs of the spring shoots in the earth, and nip off the end which would produce the flowers. By the autumn twelvemonth some of them will be rooted. At the stools, however, the plants should remain until the spring, when they should be taken off, and the best rooted and the strongest may be planted in the nursery-way, or in a dry soil and well sheltered place, where they are to remain; while the bad-rooted ones and the weakest should be planted in pots; and if these are plunged into a moderate warmth of dung, it will promote their growth, and make them good plants before autumn. In the winter they should be guarded against the frosts; and in the spring they may be planted out where they are to remain.

CEBES, of Thebes, a Socratic philosopher, author of the admired *Table of Cebes*; or "Dialogues on the birth, life, and death of Mankind." He flourished about 405 years before Christ.—The above piece is mentioned by some of the ancient writers, by Lucian, D. Laertius, Tertullian, and Suidas: but of Cebes himself we have no account, save that he is once mentioned by Plato, and once by Xenophon. The former says of him, in his "Phædo," that he was a sagacious investigator of truth, and never assented without the most convincing reasons: the latter, in his "Memorabilia," ranks him among the few intimates of Socrates, who excelled the rest in the innocence of their lives. Cebes's *Tabula* is usually printed with Epictetus's *Manuale*.

CECIL (William), Lord Burleigh, treasurer of England in the reign of queen Elizabeth, was the son of Richard Cecil, Esq; master of the robes to king Henry VIII. He was born in the house of his grandfather, David Cecil, Esq; at Bourn in Lincolnshire, in the year 1520; and received the rudiments of his education in the grammar-school at Grantham. From

Cecil

thence he was removed to Stamford; and about the year 1535, was entered of St John's College, Cambridge. Here he began his studies with a degree of enthusiastic application very uncommon in young gentlemen of family. At the age of 16 he read a sophistry lecture, and at 19 a voluntary Greek lecture, which was the more extraordinary as being at a time when the Greek language was by no means universally understood. In 1541 he went to London, and became a member of the society of Gray's-Inn, with an intention to study the law; but he had not been long in that situation, before an accident introduced him to king Henry, and gave a new bias to his pursuits. O'Neil, a famous Irish chief, coming to court, had brought with him two Irish chaplains, violent bigots to the Romish faith; with these Mr Cecil, visiting his father, happened to have a warm dispute in Latin, in which he displayed uncommon abilities. The king, being informed of it, ordered the young man into his presence, and was so pleased with his conversation, that he commanded his father to find a place for him. He accordingly requested the reversion of the *custos brevium*, which Mr Cecil afterwards possessed. About this time he married the sister of Sir John Cheke, by whom he was recommended to the earl of Hertford, afterwards duke of Somerset and protector.

Soon after king Edward's accession, Mr Cecil came into the possession of his office of *custos brevium*, worth about L. 240 a-year. His first lady dying in 1543, he married the daughter of Sir Anthony Cook, director of the king's studies. In 1547, he was appointed by the protector, master of requests; and soon after, attended his noble patron on his expedition against the Scots, and was present at the battle of Musselburgh. In this battle, which was fought on the 10th of September 1547, Mr Cecil's life was miraculously preserved by a friend, who in pushing him out of the level of a cannon, had his arm shattered to pieces. The fight and judgment of his friend must have been as extraordinary as his friendship, to perceive the precise direction of a cannon shot; unless we suppose, that the ball was almost quite spent; in which case the thing is not impossible. The story is told in his life by a domestic. In the year 1548, Mr Cecil was made secretary of state; but in the following year, the duke of Northumberland's faction prevailing, he suffered in the disgrace of the protector Somerset, and was sent prisoner to the Tower. After three months confinement he was released; in 1551 restored to his office; and soon after knighted, and sworn of the privy council. In 1553 he was made chancellor of the Order of the Garter, with an annual fee of 100 marks.

On the death of Edward VI. Mr Cecil prudently refused to have any concern in Northumberland's attempt in favour of the unfortunate Lady Jane Grey; and when queen Mary acceded to the throne, he was graciously received at Court; but, not choosing to change his religion, was dismissed from his employments. During this reign, he was twice elected knight of the shire for the county of Lincoln; and often spoke in the house of commons, with great freedom and firmness, in opposition to the ministry. Nevertheless, though a protestant and a patriot (that is, a courtier

out of place), he had the address to steer through a very dangerous sea without shipwreck.

Queen Elizabeth's accession in the year 1558 immediately dispelled the cloud which had obscured his fortunes and ministerial capacity. During the horrid reign of her sister, he had constantly corresponded with the princess Elizabeth. On the very day of her accession, he presented her with a paper containing twelve articles necessary for her immediate dispatch; and, in a few days after, was sworn of the privy-council, and made secretary of state. His first advice to the queen was, to call a parliament; and the first business he proposed after it was assembled, was the establishment of a national church. A plan of reformation was accordingly drawn up under his immediate inspection, and the legal establishment of the church of England was the consequence. Sir William Cecil's next important concern, was to restore the value of the coin, which had in the preceding reigns been considerably debased. In 1561, he was appointed master of the wards; and, in 1571, created baron of Burleigh, as a reward for his services, particularly in having lately stifled a formidable rebellion in the north. The following year he was honoured with the garter, and raised to the office of Lord High Treasurer of England. From this period we find him the *primum mobile* of every material transaction during the glorious reign of Queen Elizabeth. Notwithstanding the temporary influence of other favourites, Lord Burleigh was, in fact, her prime minister, and the person in whom she chiefly confided in matters of real importance. Having filled the highest and most important offices of the state for 40 years, and guided the helm of government during the most glorious period of English history, he departed this life on the 4th of August 1598, in the 78th year of his age. His body was removed to Stamford, and there deposited in the family vault, where a magnificent tomb was erected to his memory. — Notwithstanding his long enjoyment of such lucrative employments, he left only an estate of L. 4000 *per annum*, L. 11,000 in money, and effects worth about L. 14,000. He lived, indeed, in a manner suitable to his high rank and importance. He had four places of residence, viz. his lodgings at court, his house in the Strand, his seat at Burleigh-Park near Stamford, and his seat at Theobalds. The last of these was his favourite place of retirement, where he frequently entertained the queen at a vast expence.

Lord Burleigh was doubtless a man of singular abilities and prudence; amiable in his private character, and one of the most able, upright, and indefatigable ministers ever recorded in the annals of this kingdom. His principal works are, 1. *La Complainte de l'ame pecheresse*, or the Complaint of a sinful Soul, in French verse, in the king's library. 2. Materials for Patten's *Diarium exped. Scotice*, London 1541, 12mo. 3. Slanders and lies maliciously, grossly, and impudently vomited out, in certain traitorous books and pamphlets, against two counsellors, Sir Francis Bacon and Sir William Cecil. 4. A speech in parliament, 1562, Strype's Mem. vol. iv. p. 107. 5. Precepts or directions for the well ordering of a man's life, 1637, Harl. Cat. vol. ii. p. 755. 6. Meditations on the death of his lady, Ballard's Mem. p. 184. 7. Meditations

Cecil

Cecilia.

Meditations on the state of England during the reign of queen Elizabeth, manuscript. 8. The execution of justice in England for the maintenance of public and Christian peace, &c. Lond. 1581, 1583, Somer's tracts, 4th collect. vol. i. p. 5. 9. Advice to queen Elizabeth in matters of religion and state, ib. p. 101. 16. 10. A great number of letters. See Peck's *Defiderata Curiosa*, Howard's collections, &c. 11. Several pedigrees, some of which are preserved in the archbishop of Canterbury's library at Lambeth, n^o 299, 747.

CECILIA (St), the patroness of music, has been honoured as a martyr ever since the fifth century. Her story as delivered by the notaries of the Roman church, and from them transcribed into the Golden Legend and other books of the like kind, says, that she was a Roman lady born of noble parents, about the year 225. That, notwithstanding she had been converted to Christianity, her parents married her to a young pagan nobleman named Valerianus; who going to bed to her on the wedding night, *as the custom is*, says the book, was given to understand by his spouse, that she was nightly visited by an angel, and that he must forbear to approach her, otherwise the angel would destroy him. Valerianus, somewhat troubled at these words, desired that he might see his rival the angel; but his spouse told him that was impossible, unless he would consent to be baptized and become a Christian. This he consented to; after which, returning to his wife, he found her in her closet at prayer, and by her side, in the shape of a beautiful young man, the angel clothed with brightness. After some conversation with the angel, Valerianus told him that he had a brother named Tiburtius, whom he greatly wished to see a partaker of the grace which he himself had received. The angel told him that his desire was granted, and that they should be both crowned with martyrdom in a short time. Upon this the angel vanished, and was not long in showing himself as good as his word; Tiburtius was converted, and both he and his brother Valerianus were beheaded. Cecilia was offered her life upon condition that she would sacrifice to the deities of the Romans; but she refused: upon which she was thrown into a caldron of boiling water, and scalded to death: others say that she was stifled in a dry bath, i. e. an inclosure, from whence the air was excluded, having a slow fire underneath it; which kind of death was sometimes inflicted by the Romans upon women of quality who were criminals. Upon the spot where her house stood, is a church said to have been built by pope Urban I. who administered baptism to her husband and his brother: it is the church of St Cecilia at Trastevere; within is a most curious painting of the saint, as also a stately monument with a cumbent statue of her with her face downwards. There is a tradition of St Cecilia, that she excelled in music; and that the angel who was thus enamoured of her, was drawn from the celestial regions by the charms of her melody: this has been deemed authority sufficient for making her the patroness of music and musicians. The legend of St Cecilia has given frequent occasion to painters and sculptors to exercise their genius in representations of her, playing on the organ, and sometimes on the harp. Raphael has painted her singing with a re-

gal in her hands; and Domenichino and Mignard, singing and playing on the harp.

CECROPS, the founder and first king of Athens, about the time of Moses the lawgiver of the Hebrews. He was the first who established civil government, religious rites, and marriage among the Greeks; and died after a reign of 50 years. See ATTICA, n^o 4.

CEDAR, in botany. See JUNIPERUS and PINUS.

The species of cedar famous for its duration, is that popularly called by us the cedar of Lebanon (Pinus cedrus), by the ancients *cedrus magna*, or the great cedar; also *cedrelate*, *Κιδριλακτη*. See the article PINUS.

CEDRENU (George), a Grecian monk, lived in the 11th age, and wrote "Annals, or an abridged History, from the Beginning of the World to the Reign of Isaac Comnenus emperor of Constantinople, who succeeded Michael IV. in 1057. This work is no more than an extract from several historians. There is an edition of it, printed at Paris in 1647, with the Latin version of Xylander, and the notes of father Goar a Dominican.

CEDRUS, the CEDAR-TREE, MAHOGANY, &c. See JUNIPERUS, PINUS, and SWIETENIA.

CEILING, in architecture, the top or roof of a lower room; or a covering of plaster, over laths nailed on the bottom of the joists that bear the floor of the upper room; or where there is no upper room, on joists for the purpose; hence called *ceiling joists*. The word *ceiling* answers pretty accurately to the Latin *lacunar*, "every thing over head."

Plastered ceiling, are much used in Britain, more than in any other country: nor are they without their advantages, as they make the room lightsome; are good in case of fire; stop the passage of the dust; lessen the noise over head; and, in summer, make the air cooler.

CEILING, in sea-language, denotes the inside planks of a ship.

CEIMELIA, from *κειμαι*, "to be laid up," in antiquity, denotes choice or precious pieces of furniture or ornaments, reserved or laid up for extraordinary occasions and uses; in which sense, sacred garments, vessels, and the like, are reputed of the ceimelia of a church. Medals, antique stones, figures, manuscripts, records, &c. are the ceimelia of men of letters.

CEIMELIARCHIUM, the repository or place where ceimelia are preserved.

CEIMELIOPHYLAX, (from *κειμελιον* and *φυλαξις*, *I keep*), the keeper or curator of a collection of ceimelia; sometimes also denominated *ceimeliarcha*. The ceimeliarcha, or ceimeliophylax, was an officer in the ancient churches or monasteries, answering to what was otherwise denominated *chartophylax*, and *custos archivorum*.

CELÆNÆ (anc. geog.), the capital of Phrygia Magna, situated on a cognominal mountain, at the common sources of the Mæander and Marfyas. The king of Persia had a strong palace beneath the citadel, by the springs of the Marfyas, which rose in the market-place, not less in size than the Mæander, and flowed through the city. Cyrus the younger had also a palace there, but by the springs of the Mæander, which river passed likewise through the city. He had,

Cecrops

||
Celænæ.

Celandine had, moreover, an extensive paradise or park, full of wild beasts, which he hunted on horseback for exercise or amusement; and watered by the Mæander, which ran through the middle. Xerxes was said to have built these palaces and the citadel after his return from his expedition into Greece.

Antiochus Soter removed the inhabitants of Celænæ into a city, which he named from his mother, Apamea; and which became afterwards a mart inferior only to Ephesus. See APAMEA.

CELANDINE, in botany. See CHELIDONIUM.

CELANO, a town of Italy, in the kingdom of Naples, in Farther Abruzzo. It is seated a mile from the lake Celano, anciently called FUCINUS. E. Lon. 13. 39. N. Lat. 41. 56.

CELARENT, among logicians, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative.

E. gr. *cE* None whose understanding is limited can be omniscient.

LA Every man's understanding is limited.

rEnt Therefore no man is omniscient.

CELASTRUS, in botany: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 43d order, *Dumosa*. The corolla is pentapetalous and patent; the capsule quinquangular and trilocular; the seeds veiled. There are 11 species; two of which are enured to our climate.

1. The *bullatus*, an uncertain deciduous shrub, is a native of Virginia. It is about four feet in growth, rising from the ground with several stalks, which divide into many branches, and are covered with a brownish bark. The leaves are of a fine green colour, and grow alternately on the branches. They are of an oval figure, and have their edges undivided. The flowers are produced in July, at the ends of the branches, in loose spikes. They are of a white colour, and in their native countries are succeeded by very ornamental scarlet fruit; but with us this seldom happens. It is easily propagated from seeds sown, about an inch deep, in beds of good fresh mould made fine. They seldom come up until the second, and sometimes not before the third spring. It is also propagated by layers; which work must be performed on the young wood, in the autumn, by a slit at the joint. These layers may be expected to strike root by the autumn following; when they may be taken up and planted in the nursery-ground. This shrub must have a well-sheltered situation, otherwise the leaves are apt to fall off at the approach of frosty weather. And Millar says, that, growing naturally in moist places, it will not thrive well in a dry soil.

2. The *scandens*, or bastard euonymus, with woody, twining stalks, rising by the help of neighbouring trees or bushes to the height of 12 feet. The leaves are oblong, serrated, of a pleasant green colour, pale, and veined underneath, and grow alternately on the branches. The flowers are produced in small bunches, from the sides of the branches, near the ends. They are of a greenish colour, appear in June; and are succeeded by roundish, red, three-cornered capsules, containing ripe seeds, in the autumn. This species is exceeding hardy, and makes a beautiful appearance among other

trees in the autumn, by their beautiful red berries, which much resemble those of the Spindle-tree, and will be produced in vast profusion on the tops of other trees, to the height of which these plants by their twisting property aspire. They should not be planted near weak or tender trees, to climb on; for they embrace the stalks so closely as to bring on death to any but the hardiest trees and shrubs. It is propagated, 1. By laying down the young shoots in the spring. By the autumn they will have struck root, and may then be taken off and set in the places where they are designed to remain. 2. By seeds; which should be soon sown after they are ripe, otherwise they will be two and sometimes three years before they come up. When they make their appearance, nothing more need be done than keeping them clear from weeds all summer and the winter following; and in the spring the strongest plants may be drawn out, and set in the nursery for a year, and then removed to the places where they are designed to remain; whilst the weakest, being left in the seed-bed one year more, may undergo the same discipline.

In Senegal the negroes use the powder of the root as a specific against gonorrhœas, which it is said to cure in eight or sometimes in three days. An infusion of the bark of a species of staff-tree, which grows in the Isle of France, is said to possess the same virtues.

CELEBES, an island in the Indian sea, seated under the equator, and called by some *Macassar*. The length and breadth has not been accurately computed; but the circumference, at a medium, is about 800 miles. It had formerly six kingdoms, which are reduced to one. The air is hot and moist; and subject to great rains during the north-west winds, which blow from November to March, at which time the country is overflowed, and for this reason they build their houses on piles of wood 10 feet high. The most healthful time is during the northern monsoons, which seldom fail blowing regularly in one part of the year. The chief vegetables are rice and cocoas; but they have ebony, sanders, &c. Their fruits and flowers are much the same as in the neighbouring parts of the Indies. They have pepper, sugar, betel, areca, the finest cotton, and opium. The natives have bright olive complexions, and the women have shining black hair. They are thought to be very handsome by the Dutch and Chinese, who often purchase them for bed-fellows. The men are industrious, robust, and make excellent soldiers. Their arms are sabres, and trunks, from whence they blow poisoned darts, which are pointed with the tooth of a sea-fish. Some likewise use poisoned daggers. They were the last of the Indian nations that were enslaved by the Dutch, which could not be effected till after a long war. They teach their children to read and write, and their characters have some resemblance of the Arabic. Their religion being Mahometan, the men indulge themselves in many wives and concubines. The employment of the women is spinning, cookery, and making their own and their husbands cloaths. The men wear jewels in their ears, and the women gold chains about their necks. The inhabitants in general go half naked, without any thing on their head, legs, or feet, and some have nothing but a cloth about their middle. The streets of

Celastrus,
Celebes.

Celeres, the town Macassar are spacious, and planted with trees on every side. It stands by the side of the only large river they have in the island. The Dutch have a fort here, mounted with 40 guns, and garrisoned with 700 men. There is only one other town of note, called Jampandam, where they also have a fort. The island is not near so populous as when the Dutch conquered it; the men being hired for soldiers in most of the neighbouring countries.

The religion of these islands was formerly idolatry. They worshipped the sun and moon. They sacrificed to them in the public squares, having no materials which they thought valuable enough to be employed in raising temples. About two centuries ago, some Christians and Mahometans having brought their opinions to Celebes, the principal king of the country took a dislike to the national worship. Having convened a general assembly, he ascended an eminence, when, spreading out his hands towards heaven, he told the Deity, that he would acknowledge for truth that doctrine whose ministers should first arrive in his dominions, and, as the winds and waves were at his command, the Almighty would have himself to blame if he embraced a falsehood. The assembly broke up, determined to wait the orders of heaven, and to obey the first missionaries that should arrive. The mahometans were the most active, and their religion accordingly prevailed.

CELERES, in Roman antiquity, a regiment of body-guards belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the curiæ of the people, each of which furnished ten. The name comes from *celer*, "quick, ready;" and was given them because of their promptness to obey the king.

The *celeres* always attended near the king's person, to guard him, to be ready to carry his orders, and to execute them. In war, they made the van-guard in the engagement, which they always began first; in retreats, they made the rear-guard.

Though the *celeres* were a body of horse, yet they usually dismounted, and fought on foot; their commander was called tribune, or prefect of the *celeres*. They were divided into three troops, of 100 each, commanded by a captain called centurio: their tribune was the second person in the kingdom.

Plutarch says, Numa broke the *celeres*; if this be true, they were soon re-established; for we find them under most of the succeeding kings: witness the great Brutus, who expelled the Tarquins, and who was the tribune of the *celeres*.

CELERI, in botany, the English name of a variety of the *APIUM GRAVEOLENS*.

The seed of *celeri* should be sown at two or three different times, the better to continue it for use thro' the whole season without running up to seed. The first sowing should be in the beginning of March, upon a gentle hot-bed; the second may be at the end of the same month, which ought to be in an open spot of light earth, where it may enjoy the benefit of the sun; the third time of sowing should be in the latter end of April, or beginning of May, on a moist soil; and if exposed to the morning-sun only, it will be so much the better, but it should not be under the drip

of trees. The middle of May, some of the plants of the first sowing will be fit to transplant for blanching.

The manner of transplanting it is as follows: after having cleared the ground of weeds, you must dig a trench by a line about 10 inches wide, and 8 or 9 inches deep, loosening the earth in the bottom, and laying it level; and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to draw in again to earth the *celeri* as it advances in height. These trenches should be made at three feet distance from each other; then plant your plants in the middle of the trench, at about four or five inches distance, in one straight row, having before trimmed the plants, and cut off the tops of the long leaves: and as they are planted, you must observe to close the earth well to their roots with your feet, and to water them plentifully until they have taken new root. As these plants advance in height, you must observe to draw the earth on each side close to them, being careful not to bury their hearts, nor ever to do it but in dry weather; otherwise the plants will rot. When your plants have advanced a considerable height above the trenches, and all the earth, which was laid on the sides thereof, hath been employed in earthing them up, you must then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose, continuing from time to time to earth it up until it is fit for use. The last crop should be planted in a drier soil, to prevent its being rotted with too much wet in the winter. You will do well to cover your ridges of *celeri* with some pease-haulm, or some such light covering, when the frost is very hard, which will admit the air to the plants; for if they are covered too close, they will be very subject to rot: by this means you will preserve your *celeri* till spring; but you must remember to take off the covering whenever the weather will permit, otherwise it will be apt to cause the *celeri* to pipe, and run to seed. The *celeri*, when full blanched, will not continue good above three weeks or a month before it will rot or pipe; therefore, in order to continue it good, you should have, at least, six or seven different seasons of planting, proportioned to the consumption.

The other sort of *celeri*, which is commonly called *celeriace*, is to be managed in the same manner; excepting that this should be planted on the level ground, or in very shallow drills: for this plant seldom grows above eight or ten inches high, so requires but little earthing up; the great excellency of this being in the size of the root, which is often as large as ordinary turnips.

The best method to save the seed of *celeri*, is to make choice of some long good roots of the upright *celeri*, which have not been too much blanched, and plant them out, at about a foot asunder, in a moist soil, early in the spring; and when they run up to seed, keep them supported with stakes, to prevent their being broken down with the wind: and in July, when the seed begins to be formed, if the season should prove very dry, it will be proper to give some water to the plant, which will greatly help its producing good seeds. In August these seeds will be ripe, at which time it should be cut up, in a dry time, and spread

Celeri.

Celeri
||
Celeres.

spread upon cloths in the sun to dry; then beat out the seeds, and preserve it in bags for use.

CELERI, wild, (*Apium antarcticum*), was found in considerable quantities by Mr Banks and Dr Solander, on the coast of Terra del Fuego. It is like the garden celeri in the colour and disposition of the flowers, but the leaves are of a deeper green. The taste is between that of celeri and parsley. It is a very useful ingredient in the soup for seamen, because of its antiscorbutic quality.

CELERITY, in mechanics, the swiftness of any body in motion. It is also defined to be an affection of motion, by which any moveable body runs through a given space in a given time.

CELESTINS, a religious order so called from their founder Peter de Meuron, afterwards raised to the pontificate under the name of Celestin V. This Peter, who was born at Ifernica, a little town in the kingdom of Naples, in the year 1215, of but mean parents, retired, while very young, to a solitary mountain, in order to dedicate himself wholly to prayer and mortification. The fame of his piety brought several, out of curiosity, to see him; some of whom, charmed with his virtues, renounced the world to accompany him in his solitude. With these he formed a kind of community in the year 1254; which was approved by Pope Urban IV. in 1264, and erected into a distinct order, called the *hermits of St Damien*. Peter de Meuron governed this order till 1286, when his love of solitude and retirement induced him to quit the charge. In July 1294, the great reputation of his sanctity raised him, though much against his will, to the pontificate. He then took the name of Celestin V. and his order that of *Celestins* from him. By his bull he approved their constitutions, and confirmed all their monasteries to the number of 20. But he sat too short time in the chair of St Peter to do many great things for his order; for having governed the church five months and a few days, and considering the great burden he had taken upon him, to which he thought himself unequal, he solemnly renounced the pontificate in a consistory held at Naples.

After his death, which happened in 1296, his order made great progress not only in Italy, but in France likewise; whither the then general Peter of Tivoli sent 12 religious, at the request of king Philip the Fair, who gave them two monasteries; one in the forest of Orleans, and the other in the forest of Compeigne at mount Chartres. This order likewise passed into several provinces of Germany. They have about 96 convents in Italy, and 21 in France, under the title of priories.

The Celestins rise two hours after midnight, to say matins. They eat no flesh at any time, except when they are sick. They fast every Wednesday and Friday, from Easter to the feast of the exaltation of the holy cross; and, from that feast to Easter, every day. As to their habit, it consists of a white gown, a capuche, and a black scapulary. In the choir, and when they go out of the monastery, they wear a black cowl with the capuche: their shirts are of serge.

CELETES, or **CELETÆ**, (from *κίλες*, a race-horse,) in antiquity, denote single or saddle-horses; by way of contradistinction from those yoked or harnessed together, called *bigarii*, *quadrigarii*, &c. The same de-

Nº 67.

nomination is also given to the cavaliers or riders on horseback; and hence some deduce celeres, the name of Romulus's guard.

CELEUSMA, or **CELEUMA**, in antiquity, the shout or cry of the seamen, whereby they animated each other in their work of rowing. The word is formed from *καλέω*, to call, to give the signal.

CELEUSMA was also a kind of song or formula, rehearsed or played by the master, or others, to direct the strokes and movements of the mariners, as well as to encourage them to labour. See **CELEUSTES**.

CELEUSTES, in ancient navigation, the boatswain or officer appointed to give the rowers the signal, when they were to pull, and when to stop. He was also denominated *epopeus*, and by the Romans *portifculus*; sometimes simply *hortator*.

CELIBACY, the state of unmarried persons. Scaliger derives the word from the Greek *κοιτη*, "bed," and *λεγω*, *linguo*, "I leave:" others say it is formed from *cali beatitudo*; q. d. *the blessedness of heaven*.

The ancient Romans used all means imaginable to discourage celibacy. Nothing was more usual than for the censors to impose a fine on bachelors. Dionysius Halicarnassensis mentions an ancient constitution whereby all persons of full age were obliged to marry. But the first law of that kind, of which we have any certainty, is that under Augustus, called *lex Julia de maritandis ordinibus*. It was afterwards denominated *Papia Poppæa*, and more usually *Julia Papia*, in regard of some new sanction and amendments made to it under the consuls Papius and Poppæus. By this law, divers prerogatives were given to persons who had many children; penalties imposed on those who lived a single life, as that they should be incapable of receiving legacies, and not exceeding a certain proportion.

CELIBATE, the same with celibacy; but it is chiefly used in speaking of the single life of the Popish clergy, or the obligation they are under to abstain from marriage. In this sense we say the law of *celibate*. Monks and religious take a vow of celibate; and what is more, of chastity.

The church of Rome imposes an universal celibacy on all its clergy, from the pope to the lowest deacon and subdeacon. The advocates for this usage pretend, that a vow of perpetual celibacy was required in the ancient church as a condition of ordination, even from the earliest apostolic ages. But the contrary is evident from numerous examples of bishops and archbishops, who lived in a state of matrimony, without any prejudice to their ordination or their function. It is generally agreed that most of the apostles were married. Some say all of them, except St Paul and St John. Others say St Paul himself was married, because he writes to his *yoke-fellow*, whom they interpret his wife. Be this as it will; in the next ages after the apostles, we have accounts of divers married bishops, presbyters, and deacons, without any reproof or mark of dishonour set on them; e. g. Valens, presbyter of Philippi, mentioned by Polycarp; and Chæremon, bishop of Nilus. Novatus was a married presbyter of Carthage, as we learn from Cyprian; who himself was also a married man, as Pagi confesses; and so was Cæcilius the presbyter who converted him; and Numidius another presbyter of Carthage. The

reply which the Romanists give to this is, that all married persons, when they came to be ordained, promised to live separate from their wives by consent, which answered the vow of celibacy in other persons. But this is not only said without proof, but against it. For Novatus presbyter of Carthage, was certainly allowed to cohabit with his wife after ordination; as appears from the charge that Cyprian brings against him, that he had struck and abused his wife, and thereby caused her to miscarry. There seems indeed to have been, in some cases, a tendency towards the introduction of such a law, by one or two zealots; but the motion was no sooner made, than it was quashed by the authority of wiser men. Thus Eusebius observes, that Pinytus, bishop of Gnosus in Crete, was for laying the law of celibacy upon his brethren; but Dionysius bishop of Corinth wrote to him, that he should consider the weakness of men, and not impose that heavy burden on them. In the council of Nice, anno 325, the motion was renewed for a law to oblige the clergy to abstain from all conjugal society with their wives, whom they had married before their ordination: but Paphnutius, a famous Egyptian bishop, and one who himself never was married, vigorously declaimed against it, upon which it was unanimously rejected. So Socrates and Sodomus tell the story; to which all that Valesius, after Bellarmin, has to say, is, that he suspects the truth of it. The council in Trullo, held in 692, made a difference in this respect between bishops and presbyters; allowing presbyters, deacons, and all the inferior orders, to cohabit with their wives after ordination; and giving the Roman church a smart rebuke for the contrary prohibition, but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to betake themselves to a monastic life, or become deaconesses in the church. And thus was a total celibate established in the Greek church, as to bishops, but not any others. In the Latin church, the like establishment was also made, but by slow steps in many places. For in Africa, even bishops themselves cohabited with their wives at the time of the council of Trullo. The celibacy of the clergy, however, appears of an ancient standing, if not of command and necessity, yet as of counsel and choice. But as it is clearly neither of divine nor apostolical institution, it is, at first, hard to conceive from what motive the court of Rome persisted so very obstinately to impose this institution on the clergy. But we are to observe that this was a leading step to the execution of the project formed of making the clergy independent of princes, and rendering them a separate body to be governed by their own laws. In effect, while priests had children, it was very difficult to prevent their dependence on princes, whose favours have such an influence on private men; but having no family, they were more at liberty to adhere to the Pope.

CELIDOGRAFIA, the description of the spots which appear on the surfaces of the sun and planets. See ASTRONOMY, n° 58, &c.

CELL, CELLA, in ancient writers, denotes a place or apartment usually under ground, and vaulted, in which were stored up some sort of necessaries, as wine, honey, and the like; and according to which it was

VOL. IV. Part I.

called *Cella Vinaria, Olearia, Mellaria, &c.* The word is formed from the Latin *celare*, to conceal.

CELLA was also used for the lodge or habitation of a common prostitute, as being anciently under ground, hence also denominated *fornix*.

Intravit calidum veteri contone lupanar,

Et cellam vacuum.

Juv. Sat. vi. ver. 121.

On which place an ancient scholiast remarks, that the names of the whores were written on the doors of their several cells; by which we learn the meaning of *inscripta cella* in Martial, lib. xi. ep. 46.

CELLA was also applied to the bed-chambers of domestics and servants; probably as being low and narrow.—Cicero, inveighing against the luxury of Antony, says, the beds in the very cellæ of his servants were spread with pompous purple coverlets.

CELLA is also applied to the members or apartments of baths. Of these there were three principal, called *frigidaria, tepidaria, and caldaria*; to which may be added a fourth, called *cella assa*, and sometimes *sudatoria*.

CELLA likewise signified the *adyta*, or inmost and most retired parts of temples, wherein the images of the gods to whom the edifices were consecrated were preserved. In this sense we meet with *cella Jovis, cella Concordia, &c.*

CELL is also used for a lesser or subordinate sort of minister dependent on a great one, by which it was erected, and continues still to be governed. The great abbeys in England had most of them *cells* in places distant from the mother abbey, to which they were accountable, and from which they received their superiors. The alien priories in England were cells to abbeys in Normandy, France, Italy, &c. The name *cell* was also given to rich and considerable monasteries not dependent on any other.

CELL signifies also a little apartment or chamber, such as those wherein the ancient monks, solitaries, and hermits, lived in retirement. Some derive the word from the Hebrew כֶּלֶא, *i. e.* "a prison, or place where any thing is shut up."

The same name is still retained in divers monasteries. The dormitory is frequently divided into so many cells or lodges. The Carthusians have each a separate house, which serves them as a cell. The hall wherein the Roman conclave is held, is divided, by partitions, into divers cells, for the several cardinals to lodge in.

CELL is also a name given to the little divisions in honey-combs, which are always regular hexagons. See BEE.

CELL, in botany, is applied to the hollow places between the partitions in the pods, husks, and other seed-vessels of plants; according as there is one, two, three, &c. of these cells, the vessel is said to be unilocular, bilocular, trilocular, &c.

CELLS, in anatomy, little bags, or bladders, where fluids or other matters are lodged; called *loculi, cellulæ, &c.* Thus the *cellula adiposa* are the little cells where the fat is contained; *cellula* in the *colon*, are spaces wherein the excrements are detained till voided, &c.

CELLAR (*Cellarium*), in ancient writers, denotes the same with *cella*, viz. a conservatory of eatables, or drinkables.

N n

Cellar

Cella
||
Cellar.

Cellar
||
Cellini.

Cellar differs from vault, as the latter is supposed to be deeper, the former being frequently little below the surface of the ground. In which sense, *cellarium* only differed from *penus*, as the former was only a store-house for several days, the latter for a long time. Thus it is, the *baetropetræ*, a sort of ancient Cynics, are said by St Jerome to carry cellar about with them.

Cellarium also denoted an allowance of bread, wine, oil, or other provision, furnished out of the cella, to the use of the governor of the province and his officers, &c. In which sense, the word amounts to much the same with *annona*.

CELLARS, in modern building, are the lowest rooms in a house, the ceilings of which usually lie level with the surface of the ground on which the house is built; or they are situated under the pavement before the house, especially in streets and squares.

Cellars, and other places vaulted under ground, were called by the Greeks *hypogæa*: the Italians still call them *fundi delle case*.

CELLARER, or CELLERER, (*Cellerarius* or *Cellarius*), an officer in monasteries, to whom belong the care and procurement of provisions for the convent. The denomination is said to be borrowed from the Roman law, where *cellarius* denotes an examiner of accounts and expences. Ulpian defines it thus: "Cellerarius, id est, ideo præpositus ut rationes salvæ sint."

The *cellerarius* was one of the four *obedientiarii*, or great officers of monasteries: under his ordering was the *pisstrinum* or bakehouse, and the *bracinum*, or brew-house. In the richer houses there were particular lands set apart for the maintenance of his office, called in ancient writings *ad cibum monachorum*. The *cellerarius* was a great man in the convent. His whole office in ancient times had a respect to that origin: he was to see his lord's corn got in, and laid up in granaries; and his appointment consisted in a certain proportion thereof, usually fixed at a thirteenth part of the whole together with a furred gown. The office of cellarer then only differed in name from those of bailiff and minstrel; excepting that the cellarer had the receipt of his lord's rents through the whole extent of his jurisdiction.

CELLARER was also an officer in chapters, to whom belonged the care of the temporals, and particularly the distributing of bread, wine, and money to canons, on account of their attendance in the choir. In some places he was called *cellarer*, in others *barfer*, and in others *currier*.

CELLARIUS (Christopher), was born in 1638, at Smalcade in Franconia, of which town his father was minister. He was successively rector of the colleges at Weymar, Zeitz, and Mersebourg; and the king of Prussia having founded an university at Hall in 1693, he was prevailed on to be professor of eloquence and history there, where he composed the greatest part of his works. His great application to study hastened the infirmities of old age; for it is said, he would spend whole days and nights together at his books, without any attention to his health, or even the calls of nature. His works relate to grammar, geography, history, and the oriental languages, and the number of them is amazing. He died in 1707.

CELLINI (Benvenuto), an eminent statuary, who

was bred a jeweller and goldsmith, but seems to have had an extraordinary genius for the fine arts in general. He was cotemporary with Michael Angelo, and Julio Romano, and was employed by popes, kings, and other princely patrons of sciences and arts, so highly cultivated in the days of Leo X. and Charles V. some of his productions being esteemed most exquisite. He lived to a very considerable old age; and his life, almost to the last, was a continued scene of adventure, persecution, and misfortune, truly wonderful. He wrote his own history, which was not, however, published till the year 1730, probably on account of the excessive freedom with which he therein treated many distinguished personages of Italy and other countries. It was translated into English by Dr Nugent in 1771, to which the reader is referred, as it will not admit of an abridgement suitable to the design of this work.

CELLULAR, in a general sense, is applied to any thing consisting of single cells.

CELLULAR Membrane. See ANATOMY, n° 83 et seq.

CELOSIA, COCKS-COMB: A genus of the monogynia order, belonging to the pentandria class of plants; and in the natural method ranking under the 54th order, *Miscellaneæ*. The calyx is triphyllous; the corolla is five-petalled in appearance; the stamina are conjoined at the base to the plaited nectarium; the capsule gaping horizontally. There are eight species, of which the most worthy of notice is the *cristata*, or common cockscomb, so called on account of its crested head of flowers, resembling a cock's comb; of these there are a great variety of species. The principal colours of their flowers are red, purple, yellow, and white; but there are some whose heads are variegated with two or three colours. The heads are sometimes divided like a plume of feathers, and are of a beautiful scarlet colour. These plants are very tender exotics, and require a great deal of care to cultivate them in this country. Three hot-beds must be prepared; a small one in March, on which to raise the plants an inch or two in height; a second in April, of larger dimensions, in which to transplant them when proper; and a third in May for a large frame, to receive them transplanted into pots, to remain till the end of June or beginning of July to grow to full size: all of which hot-beds must be covered with frames and glasses, and have five or six inches depth of fine rich light earth for the reception of the seed and plants; and in the second and third hot-bed, the frames must occasionally be raised or augmented, according as the plants shall rise in height.

CELSIA, in botany: A genus of the angiospermia order, belonging to the tridynamia class of plants; and in the natural method ranking under the 28th order, *Luride*. The calyx is quinquepartite: the corolla wheel-shaped; the filaments bearded or woolly; the capsule bilocular.

CELSUS (Aurelius Cornelius), a celebrated physician of the first century, who wrote eight books on medicine, in elegant Latin. He was the Hippocrates of the Latins, and Quintilian gives him a high eulogium. The great Boerhaave tells us, that Celsus is one of the best authors of antiquity for letting us into the true meaning and opinions of Hippocrates; and that, without him, the writings of this father in phy-

tic

Cellular
||
Celsus.

Celsus,
Celtæ.

fic would be often unintelligible, often misunderstood by us. He shows us also how the ancients cured distempers by friction, bathing, &c. His eight books *de Medicina* have been several times printed. The Elzivir edition, in the year 1650, by Vander Linden, is the best, as being entirely corrected from his manuscripts.

CELSUS, an Epicurean philosopher, in the second century. He wrote a work against the Christians, entitled, *The true Discourse*; to which Origen, at the desire of Ambrose his friend, wrote a learned answer. To this philosopher Lucian dedicated his *Pseudomanies*.
